What of Business Had There Been No War?

By PHIL S. HANNA

Financial Editor, Michigan Manufacturer and Financial Record

A talk before the Pontiac Board of Commerce, April 21.

LET ME SAY by way of introduction that I hope this discussion will not definitely settle the question, for if it did, many of us financial writers would be out of a job.

Not infrequently we hear references to the years 1913 and 1914 with the inference that all would be well if only conditions prevailing then could be invoked now. And it has therefore occurred to me that perhaps a brief review of those years may throw some light on our present troubles. In fact the similarity of conditions prevailing during the second half of 1913 and the first half of 1914 to those existing today, has given rise to the question as to what would have been the course of business during 1915 and 1916 if there had not been a world war?

Referring to the Annalist, we find the statement in its review of 1913 that "this was a year of stagnation." And here are some figures which go to emphasize the condition of business in that period. Of fifty dividend-paying stocks, twenty-five railroad stocks and twenty-five industrials, listed on the New York Stock Exchange the average price from December, 1911, to April, 1914, dropped from 85 to 65. Of forty high grade listed bonds the average price dropped from 95 to 85½ during the same period. The cost of living, as represented by the Annalist index number, and which was computed by taking a representative number of articles used in the average household, shows an increase from 80.096 in 1896 to 146.069 in 1914.

The United States figures on exports and imports for the two fiscal year ended June 30, 1914, a month before the war began, also reflect the trend of our foreign business immediately preceding the war.

Year ended June 30, 1913	
Exports	$2,465,000,000
Imports	1,813,000,000
Balance	$ 652,000,000
Year ended June 30, 1914—	
Exports	$2,364,000,000
Imports	1,893,000,000
Balance	$ 471,000,000

It will be noted that the avorable trade balance for the second period fell off $181,000,000 and that for the second year exports declined and imports increased, the former $101,000,000 and the latter $80,000,000. So that we have in these illustrations a picture in a limited way of what was going on during the few years that preceded the war. And the interpretation put on this trend is held by many authorities to mean that the same disease, over-production, that is standing in the way of normal business now was gripping the country then.

We have also another barometer which should be consulted in any review of business, namely, the ratio of gold to the total of loans. Now it is a mooted question whether the amount of gold owned by the nation, compared with the total of notes upon which bank assets are based, has a deciding influence for good business or bad business, but nevertheless the figures are interesting at this time when people are watching reserve ratios, and when, incidentally, there is plenty of time to study conditions.

Tingley shows the following figures, which include all the gold in the country (not merely the Federal Reserve hodings), and the total loans and investments of all the banks, national, state and private:

	Total Loans and Investments	Total Gold	Ratio
1890	$3,052,640,000	$856,000,000	19.4%
1920 (June 30)	30,892,000,000	2,688,000,000	8.7%

He also gives the ratio in 1914 as 12.4 per cent.

His next computation is the relation of gold to paper money in use and in this all of the various government, federal reserve and bank notes are included:

1914, ratio 56 per cent; 1917, ratio 66 per cent; 1920, ratio 46 per cent.

He then computes the ratio between the total gold and total bank clearings, which show that for many years the percentage of gold to clearings seldom varied far from 3.5 per cent, but that from 1914 to 1920 the ratio ran down from 1¼ to a little over one-half of one per cent.

Therefore, regardless of whether one believes in the theory, there is this deduction, that when the amount of paper credit or paper money gets beyond a certain proportion to the total of hard money in the country, there is a definite reaction.

On the other hand, prices between 1873 and 1897 dropped 50 per cent, while volume of gold increased from $36,000,000 to $57,000,000, and between 1897 and 1915 prices advanced 80 per cent, while gold volume kept on going up—making a gain of 77 per cent over 1897 and 180 per cent over 1873. So here we have the rule working both ways so far as the relation of gold and prices is concerned. I have never been a very enthusiastic believer in the quantitative theory of money. I think the current of gold into or out of this country depends mainly on the balancing of exports and imports. As an example of this, note the present falling prices in spite of increasing gold imports.

Speaking of prices, recently I ran across figures covering a period of more than 100 years, from 1810 to 1920, furnished by the Russell Sage Foundation, which, as a guide to what we may expect during the next few years, may be worth considering. The curve is most remarkable in that it shows that prices reached about the same levels during the wars of 1812, 1860 and 1914-20; and furthermore, prices reacted between these high points to approximately the same low level. The basis used was the index numbers computed by the government bureau

Drilling

A Discussion of the Various Types of Machines for This Purpose; What Buyer Should Keep in Mind

By JOHN J. RALPH

CUTTING holes in wood, metal and stone has been an important industry since the days when our ancestors ran around in wolf skins for comfort instead of fashion and the jewelry industry began with the popularization of the bear claw necklace.

Probably the first holes were made by rubbing flat stones or shells on a pointed stone. Of course pointed wood and bone were used on soft materials. When discovery was made of iron and how to work it, the heated iron rod was used for boring holes in wood.

Later came the development of steel and means for hardening it. This gave a means of cutting holes in hard metals and shortly afterwards there was developed the first primitive machine for helping with the drilling. This was the bow drill. It probably had been used long before this in primitive fire-making methods, for some of the aboriginal tribes who had not progressed to the point of using metal used the bow to twirl a stick against another to get fire.

This bow drill was of many different forms and has not yet gone out of use. The European jeweler still uses it and it is a standard assistant to the oriental metal worker. In the least developed types there is a bow with a string. This string is wound around the drill itself and pressure is put on the upper end of the drill with a stone having a recess in it. In the more developed form the drill point is held in a quill.

FIGURE 1—THE BOW DRILL

We rather loosely refer both to the cutting tool and the driving machine as the drill. Before we can consider the machine the cutting tool should be thoroughly understood, for the machine is designed to use it.

In the manufacturing industry the drilling of holes in metal is most important, although special trades find it necessary to study carefully the problem of cutting bone, glass, rubber, horn and other substances.

Drills may be put into three classes—those which are hand tools and are usually used for cutting holes in the softer materials, drills for cutting stone and in mining work, and the power-driven drill for metal.

"A" in Fig. 2 is the simplest kind of a drilling bit. It is the flat drill of the metal working industry and is the stone drill of the miner and quarryman.

This tool is merely a round or octagonal or hexagonal rod flattened out on one end. When used as a stone drill the cutting edges are sharpened from both sides. Cutting is done by holding the drill and hitting it on the top with a hammer. The drill is turned after each blow.

Today we have developed machines, both steam and air-driven, for drilling holes in stone. The bits differ from those used in hand work in having four cutting edges in the form of a cross. The method of cutting is the same, consisting of a series of hammer blows on the end of the drill, cutting through the stone by crushing it.

"B" is the little hand wood bit. In some of the older forms the screw end is replaced by a chisel end. The invention of the screw on the end was a great advance because it made it far easier to start and helped to pull it through.

"C" is the modern auger for drilling holes in wood. There is the same screw end to assist in pulling the bit through. There are cutting edges which are keen and knife-like and another knife edge on each side which breaks up the chip. The bit is twisted so that the chips as cut out by the four knife edges are lifted out of the hole.

The driving end is shown as made for use in the ordinary carpenter's brace. In the larger sizes they are sometimes made with a square parallel driving end which fits into a cross bar.

The oldest form, the flat drill, shown in "A," Figure 2, is still used to a certain extent. It is often made in the shop to cut a certain hole for which there is no twist drill available. It has two cutting edges which are backed off to give clearance. It may have either a straight driving end, as shown in the figure, or it may have a taper drive, as has the twist drill shown.

The disadvantages of this drill are that it will not cut as accurate a hole as the modern forms, nor will it cut as quickly or with as little power.

The Twist Drill

The twist drill in its present form is the result of all the past centuries of development. It is today one of the most satisfactory cutting tools we have in our shops. It is used for practically all materials, is made with a range of size of from a few thousandths of an inch to several inches in diameter and in length from about an inch for the small sizes to a couple of feet for the larger sizes. Not until you get to deep hole drilling do you find any competitor.

Made in quantity by a number of manufacturers, the cost of these tools is so small and the quality so good that a manufacturing plant is almost never justified in making its own. The range of exact sizes available from stock is enormous, the interval between sizes being only a few thousandths of an inch.

The range of quality is also equally great. There is the cheap, rather inaccurate carbon steel drill sold for use in the carpenter's bit stock; the so-called jobber's drill with a cylindrical driving end which is held somewhat more closely to size. The best drills are those made for machine shop work, held very closely to nominal size. They may be made either of high grade carbon steel or of high speed steel, depending on the work they are to do.

If you would get perfect results from any tool, it must be in perfect condition and be handled exactly as it should be. The drill is no exception to the rule. A glance at the sketch (next page) will show that it is not a simple shape.

The main body of the drill is a spiral. It is not impossible to bend this body; in fact in the smaller and medium sizes it is easy. If it is not straight it cannot do good work.

At the lower end are the cutting edges. These with the surfaces back of them form almost a section of a cone. It is not a true section because the metal is ground away at "B" so that the edge can be forced into the metal being cut. This surface is not a regular one because there must be just as much clearance at the center as at the outside of the cutting edges and this can be got there only by grinding back more sharply at that point.

The center is not a point but a knife edge. The shorter this knife edge the easier the bit will drill. In some of the more recently designed bits the construction is such as to cut down the length of this central portion. Certain mechanics gain the same result by grinding the groove at the center with a narrow wheel to cut down the amount of metal at that point.

The two-lipped twist drill is not a precision tool. If a really accurate hole is desired it must be either bored, reamed or ground. The accuracy is sufficient for most purposes, however. In order to attain it care must be taken of the bit and both cutting and driving ends and the drilling machine be in good condition.

Mention has been made that the central knife

A B C

FIGURE 2

edge must be as short as possible. If it is not exactly central the drill will run out and cut a larger hole than the nominal size.

The cutting edges must make the same angle with the axis of the drill or only one edge will cut and the unbalanced drill will run out and cut a larger hole than is wished.

The clearance ground behind each cutting edge will be the same or there will be a tendency to cut an unequal chip, with the same result.

The angle the cutting edges make with the axis and the amount of clearance to be ground off behind the edge will differ in different materials. The twist drill when used in slate will have cutting edges making a very acute angle with the axis, while the harder the material the more nearly perpendicular they are. The harder the material the less clearance necessary.

Digitized by Google

For the ordinary run of work in the shop, experience has shown that an angle of 59 degrees with the axis is the most satisfactory. Drills are therefore usually ground to that angle unless there is a very special condition.

An expert man can grind a fairly satisfactory point on a drill. To do a good job by hand requires considerable time and the use of angle measuring instruments. Few mechanics either understand or like to sharpen a drill correctly and in many shops the only tools in condition are the new drills. Very often a man will work with a dull tool rather than sharpen it. The duller the drill the more probable is breakage, the more inaccurate the work, and there is a double loss in the lessened speed of drilling and the excess power required.

For this reason a drill sharpening machine is a good investment for almost any shop and is indispensible where quantity work is done. This machine should be located in the tool room and it should be a fixed rule that none but sharp drills in the best condition shall be issued.

Driving the Drill

To make a drill cut, pressure is needed in two different directions. There must be pressure driving the drill into the work. This is the feed. Then there must be pressure which drives the drill around.

The driving end of a drill is in some respects the least satisfactory part of this tool. For the smaller sizes of drills a cylindrical end is used. These drills usually are held in a chuck by friction, although in the larger sizes keyways are sometimes cut to give positive driving.

For many years the standard driving end has been the taper with a milled tang on the upper end. This type has the advantage that the heavier the feed pressure the heavier the frictional grip on the taper shank. The squared tang fitting into a slot also gives positive drive. This tang is, however, not primarily designed to do the driving. It furnishes the means of removing the drill from the socket, a drift being driven through the slot to drive out the drill. This releases it without injuring either the taper on the shank or the taper socket in the drill spindle.

Careful attention should be paid to the driving end of this tool. Twisted and broken tangs and battered tapers injure the sockets of the drilling machines. Spindle sockets are not easy to repair without tearing down the whole drilling head. If either the taper shank or the taper socket is bent or bruised, or if there is a chip between the two, it will be necessary to cut down on both feed and speed because the drill will slip under high duty unless the contact between the two cones is perfect.

Drilling speeds are figured from the lineal speed of the outside of the drill. The extremes range from twenty feet to three hundred feet per minute. It is impossible to give any absolute range because the conditions vary so much in different shops. The economical speed will depend first upon the drill, its condition and the material from which it is made; second, the material being drilled; third, the machine which drives the drill.

The feed allowable per revolution increases with the size of the drill.

The following table is perhaps a fair average for usual conditions. The proper procedure is to adopt a moderate speed and feed then increase it to a point where breakage of drills, burning of points and decreased quality of work prove that the rate is too high, then drop back to a speed and feed that can be maintained economically.

	Carbon Steel Drills.		High Speed Drills.
Bronze or brass....	150 Ft/Min.		300 Ft/Min.
Cast iron, soft....	85	"	170	"
Cast iron, hard....	40	"	80	"
Mild Steel.....	60	"	120	"
Drop forgings.....	30	"	60	"
Malleable iron.....	45	"	90	"
Tool steel.....	30	"	60	"
Cast steel.....	20	"	40	"

Feeds are .003" to .007" for drills up to ⅝" in diameter, per rev.
.005" to .015" for drills from ⅝" up in diameter, per rev.

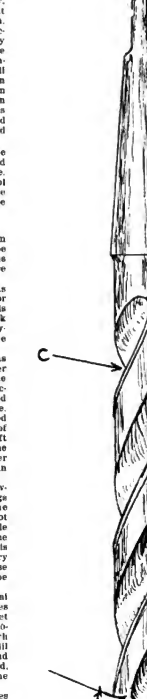

FIGURE 3—THE TWIST DRILL

a—cutting edge; b—clearance ground to allow edge to cut; c—groove which clears the chips; d—land full diameter section of drill; e—relief milled to cut down friction on wall of hole; f—taper end; g—tang; h—center, which must be exactly correct; i—angles of cutting edges with axis, which must be exactly equal.

It is usual to use about the same feed per revolution for every kind of material for the same diameter of drill and for both carbon and high speed drills. The decrease in drilling time coming with the increased number of revolutions.

Drill manufacturers were among the first to adopt high speed steel and to develop methods of machining and hardening which would give the best of results.

They were forced to it by competition and the continual demand for something better. They were able to do it because of the number of duplicate pieces they turned out and because they specialized in that one kind of work.

The development of the high speed steel drill called attention to the fact that the carbon steel drill had not been worked to its maximum capacity, and today good shop practice with these is considerably above that of only a few years ago.

The adoption of the high speed, high capacity drill has forced a complete re-design of drilling machines. A few years ago a drill press was a very simple tool, costing but little, never giving trouble and seldom considered. Today it is one of the expensive tools in the shop and is built in an amazing variety of forms and sizes.

Fifteen years ago a good mechanic could spot any drill press he might see and tell offhand just what kind and make of machine should be used for a certain kind of work. He cannot do it today.

The Advance in Drilling Practice

Of late years the importance of drilling has come to be more justly realized. Almost every piece of metal that goes into a machine has to be drilled. Some pieces must have hundreds of holes drilled in them.

Each hole means that some piece is inserted there or that it forms a part or all of the means of holding two or more pieces together or keeping them in line. Holes are not drilled for ornament and it is very necessary to consider carefully what the exact purpose of each hole is before designing for drilling it.

There is not merely the cost of the hole to consider, but the cost of the operations that come after. In some cases it pays to spend a considerable sum of money on a somewhat insignificant looking hole to save costs in assembling and insure proper functioning of the machine.

Another great factor considered today is interchangeability. This is absolutely dependent upon the accuracy of the holes drilled in the different parts.

Years ago an important hole was never drilled until after the parts had been fitted together. If it was necessary for an absolute fit they were clamped together and drilled as one—with a drill press if the pieces could be bandied on it, or by hand with a ratchet drill, and an "old man" if they were too big to be bandied under the press. This was extremely costly but wage rates were low and competitors worked the same way.

Today the practice is to machine accurately and to do as little hand work as is possible, so cutting both the machining and assembling time.

Some Steps in Progress

The first step was a reform in drafting practice. Full dimensions were demanded with allowable limits. The old type drawing that the mechanic scaled with his pocket rule was relegated to the scrap heap.

The shop equipped itself with real measuring instruments and adopted a system of working to thousandths of an inch. They also developed limit gages. Machine tools were equipped with graduated collars reading to thousandths of an inch. New methods were worked out for locating points.

Our machines have become more rigid and accurate also, so that today the possibilities of accurate machining are greater than they were only a few years ago.

The greatest development came in the per-

Digitized by Google

fection of the practice of using jigs and fixtures. These have always been used, but today they are more elaborate, more accurate, more quickly operated and more general than ever before. They are also used for far larger pieces than was the case only a few years ago.

The design of a machine having been settled, together with its limits of accuracy and the degree of interchangeability, there is today but one criterion by which to judge how it is to be machined. This so that the total cost of making the machine shall be the very lowest possible.

As a general rule the method to be used depends upon the number of indentical machines to be made. The machine shop man makes a big distinction between "building" and "manufacturing." The former term is used where but a few duplicates are made, and the latter where the quantities are large. As a matter of common sense there is considerably less attention paid to assistants in machining where the product is only "built." Here considerable

FIGURE 4—SINGLE COLUMN DRILL PRESS

a—main belt; b—machine belt; c—spindle; d—quill; e—chuck; f—rack on quill; g—lever feed; h—table; i—worm feed.

hand work is permitted, but as soon as the manufacturing condition is approached the entire plant is keyed up for the elimination of hand or individual machine work, and every effort is made to cut down the man hours of labor, with the substitution of unskilled labor for skilled wherever possible.

As a rule, the larger the machine the less the number of duplicates made. It is seldom that very fine machines are made in large quantities. We have, then, as a general rule, that large and very fine machines are built and not manufactured.

Jigs and Fixtures

Jigs and fixtures are mechanisms that take the piece to be machined and hold it in a fixed position with respect to the cutting tool. If this mechanism guides the cutting tool, it is usually called a jig. If it merely holds the piece without guiding the tool, it is usually called a fixture.

The designing of jigs and fixtures has come to be rather a specialized trade. They have been used for many years, particularly in the lines making small metal goods, such as alarm clocks, watches, revolvers and rifles, but the range, both of the kind of jigs and their size, has been greatly extended within the last twenty-five years. There are today large companies which do practically nothing else but design and make the auxiliary mechanisms which really are part of the machine tools and convert a standard tool to a special machine particularly suited to the job in question.

The adoption of jigs, which took away the necessity of skilled workmanship, focused the attention upon the efficiency of the actual drilling, and is one of the reasons for the great demand for the high speed drills.

The development of the automotive industry is the main reason for this change. They have incessantly demanded improvements in drilling machines, new types to meet their needs, lessening of time necessary to set up the machine and the piece and enormously increased speeds and feeds in drilling. At the same time they have demanded a great increase in accuracy and quality of product and higher reliability of the drilling machines.

More than any other industry they have realized the value of these points and the necessity and desirability of paying for them.

The Drilling Machine

In Figure 4 is illustrated one of the simplest of drill presses. It is a single column machine with fixed head, belt-driven, hand-feed either by lever or by worm. The table can be raised or lowered or swung out of the way. It is also arranged so that it can be revolved. There are four changes of speed, all by belt, and there are no back gears.

This is essentially a machine for the small jobbing shop or where only "building" is done. It was correctly located being in a shop where scientific instruments are made in small quantities.

Fig. 5 shows a gang drill with four spindles. Note that the four heads are adjustable and that they are now set at varying distances from the table.

Both pictures show clearly the small diameter spindle which does the driving, being driven by a key in pulley at the top in Figure 5 and in the gear in Figure 4. Feeding is through the rack attached to the quill, visible in Figure 4. There is a thrust bearing easily seen on each of the four spindles in Figure 5. The spindle rotates the drill. The quill does the feeding and stiffens the spindle, increasing its accuracy.

Many Duties of a Drilling Machine

So far we have spoken merely of the drilling which is done on a drill press. As a matter of fact this is only one of the operations it is called upon to perform. Others are boring, reaming, counter-boring, facing, milling and tapping.

In some cases it is desirable to do each of these operations on any one hole at one setting. In other cases it is desirable to drill all holes on one side of a casting at one time, then later to tap those that need it, and do the facing, counter-boring and reaming at another machine.

The size of pieces to be drilled varies from the tiny nuts used to hold together your ingersoll watch to the massive locomotive engines thirty feet high. The size of hole varies from a few thousandths to several inches in diameter. The speed of the spindle to drive the small 1-32-inch drill at 80 feet per minute is about 10,000 R. P. M.

No one machine can do all of these, but it is surprising what a range of work can be taken care of in some of the machines. Still others are adapted merely for one limited range of work but are exceedingly efficient within these bounds.

Some are arranged to do only dry drilling; others have elaborate arrangements to keep a flood of cooling and lubricating liquid on the drill all the time. The number of spindles may vary from one to thirty. Feed may be by hand, automatic or semi-automatic.

The sensitive drill is a vertical drill, often mounted on the bench, or perhaps on a column. This drill will have a maximum spindle speed of from 1,600 to 10,000, depending upon the type. It will not have back gears and feed will be through a lever by hand. The total speed ratio will perhaps be about 6:1.

The higher speed drills will be used for the smallest work. It is necessary when buying these to see that spindles, pulleys and chucks are absolutely in running balance, for if they are not, these extreme speeds are so great that it will not take long to wreck the machine. If they are not in balance the vibration will break drills and will not permit good work.

The chucks used with such high speed drills must also be very carefully balanced, for a chuck can cause as much trouble as any other part of the machine if unbalanced.

It might be thought that the breakage with such high speeds would be great, but the reverse is true. If the drill is running at its proper speed it will drill many times the same

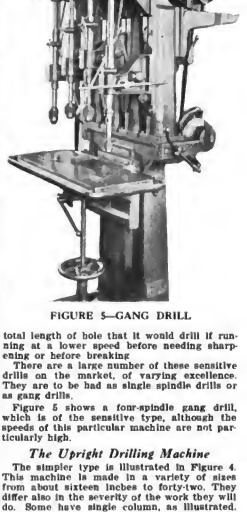

FIGURE 5—GANG DRILL

total length of hole that it would drill if running at a lower speed before needing sharpening or before breaking.

There are a large number of these sensitive drills on the market, of varying excellence. They are to be had as single spindle drills or as gang drills.

Figure 5 shows a four-spindle gang drill, which is of the sensitive type, although the speeds of this particular machine are not particularly high.

The Upright Drilling Machine

The simpler type is illustrated in Figure 4. This machine is made in a variety of sizes from about sixteen inches to forty-two. They differ also in the severity of the work they will do. Some have single column, as illustrated. Others have a re-enforcing column in back of the main column.

The type of drive varies considerably, also. There is the standard belt drive. The heavier duty machines have gone to a speed box drive. Others are motor driven.

Feeds vary greatly, also. The lever feed is used in the smaller sizes. There is almost always a worm feed, also. In many cases the feed is by power as well as by hand. Practi-

Digitized by Google

cally all with power feeds have automatic throw-outs regulating depth of drilling.

This type of machine is also made with a turret on the drill spindle which enables the drill hand to use one tool after another with the same setting of the piece in the fixture.

FIGURE 6—VERTICAL MULTIPLE SPINDLE DRILL

Some of the machines are arranged with back gears. This is usual with the larger ones. This makes boring possible, also heavy tapping and facing.

It was found that the upright drilling machine did not give sufficient power or rigidity for the heaviest kind of work, and there was, therefore, developed for the automotive builders, a real hogging machine which would be sufficiently powerful and rigid to get the most out of any high speed drill.

This meant a much heavier machine and a solid box column type of frame. The parts throughout are very heavy and strong. The feed is particularly heavy. The machine may at times take as much as fifteen to twenty horsepower and all the parts must be made strong and rigid enough to take this. It must also be capable of highly accurate work, so the table has long, strong gibs holding it to the column. The pressure to be taken on the table, together with the weight of jigs and piece, are great, so that it is necessary to support the table from below with a telescoping screw.

These machines are always equipped with a pump so that the tools and work may be kept flooded with lubricant.

It is common to find arrangements made for conveniently holding facing tools and also small tools in the spindle socket.

These machines were brought out as a result of the wrecking of the common upright drills under the heavy service given in the automobile building shops. The speeds of operation are higher and the feeds are greater. This meant that it was necessary to depart radically from usual practice.

Even the first of these machines did not always stand up, and they have been made heavier and heavier. Before buying it will be well to discover whether or not the particular machine you have in mind has really been developed to handle work as heavy as you intend to put on it.

The vertical radial is an old stand-by in the builder's shop. It finds much use in the tool room of the manufacturing plant, and there are many places even in manufacturing where there is no more suitable machine.

The arm is movable up and down on the column and swings over the work. It can be clamped in any position. The head moves in and out on the arm, thus enabling the drill to be located at any point over the part being machined.

Until the development of the high speed drill, the vertical radial was a simple, rather inexpensive machine. Today that is no longer true.

With the increase of feeds and the demand for greater accuracy it has been necessary to make great changes in the design. It will be realized that the radial drill is structurally weak. There is bending in the column and in the arm, and there is play in the swing around the column, in the elevating mechanism, in the fit of the head on the arm. All of these add up.

There are two opposite ideals to be satisfied —rigidity, so that the work may be accurate, and ease of working and movement, so that work may be done quickly and with as little fatigue as possible for the drill hand.

The sizes of radials vary from the little three-foot arm to the usual large radial with a six-foot arm. They have been made with arms as long as ten feet and to take a casting six or seven feet under the arm.

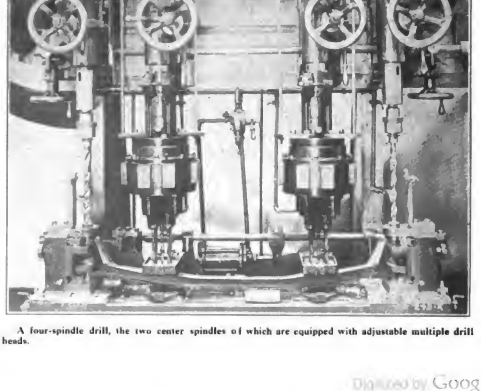
In the larger sizes it has been necessary to add power movements for head and arm. This with automatic trips for feed disengagement, special tapping reverse, a larger number of feeds and speeds, safety knockouts, etc., has made a complicated and expensive machine.

They are used mostly in shops making the larger kinds of machinery and many of them have enormous drilling capacity.

It is usual to supply them with an L-shaped base, on one of the arms of which is placed either a right angle or a universal table, one side of which is parallel to the floor and the other perpendicular to it. This permits the clamping of pieces which must be drilled perpendicular to a finished surface. The top of the table is convenient for working on smaller pieces which would be far too low if clamped on the base.

The universal vertical radial is similar to the vertical radial, but has an arm which can be swivelled about its long axis so that the drill may be made to work at any angle in addition. The drilling head travels up and down plane parallel to the axis of the column. The head differs from the head on the standard radial in that it also may be swivelled in a plane parallel to the face of the arm. The combination of these two movements permits the spindle to be placed at any desired angle.

In many types of machinery a machine such as this is absolutely indispensable. It is necessarily much less rigid than the vertical radial, for there are two more joints. When locked in the standard position of the usual vertical radial it will be almost as stiff. When the spindle has been swivelled it is necessary in many positions to reduce the feed materially because of the leverage against the locking mechanism.



The horizontal radial is a machine built to take care of the large amount of work which must have holes drilled parallel to some machined surface. It is a machine which cuts down materially the time of setting up, but has not been developed to the same point that the vertical radial has for sheer ability to machine.

The horizontal drilling, boring and milling machine is a favorite of the tool room. Extremely rigid, with its deep box bed, and with very accurate movements in and out and up and down, it is an ideal machine for making jigs. The holes in a jig must be far more accurate than is necessary in an ordinary machine part, for the piece machined in the jig will reproduce every inaccuracy of that jig and some that are not there.

Many times to get an accurate hole it is necessary first to drill it and then to bore it. This machine will do it at one setting. At the same time it will do milling and facing both rapidly and accurately. If this can be done at the time the jig is set for drilling, the accuracy is materially increased.

In the building shop it finds a very considerable field, as the same superiorities which make it desirable for making jigs make it very satisfactory for making single pieces which must be accurately machined.

The horizontal drilling, boring and tapping machine has been developed for taking care of two kinds of work. There is the very large casting which cannot be put under the radial drill press but which can be put on the table by the crane without difficulty. The column of this machine is securely fastened to the foun-

A four-spindle drill, the two center spindles of which are equipped with adjustable multiple drill heads.

this column. In one type the table is mounted on wheels which run on planed railroad rails, and in another it slides in scraped V's just as does a planer table.

These machines have not yet come into their own. They are direct competitors of the vertical radial drills and because of their construction do not suffer from the compounding of bending and giving in various joints.

They are much simpler to manufacture and should be less expensive, but have been made needlessly complicated. There was an old type with a belt-driven spindle with two round vertical columns instead of the box column which had a large range of operation and was sold rather inexpensively. It was thoroughly satisfactory but did not seem to fit "progressive" ideas of design.

The floor type horizontal drilling, boring and milling machine is made by several firms for machining large pieces. In some of them the column has as much as twelve feet travel in a horizontal direction and the head has almost as much motion up and down. It is of course used for large work which is hoisted to the floor plate. This machine drills, taps, counterbores, faces, bores, face mills, all without changing the position of the piece being worked on until it is necessary to turn it to get at the other side.

The moveable drill press also is used for very large work. Here the piece or machine to be drilled is left on the floor of the shop and the crane picks up the drilling machine, which has a motor attached, and places it in a position where it can do the drilling and tapping required.

The wall radial drill is placed on one of the steel columns of the shop or attached to the wall. The arm may be twelve to fifteen feet long and it is usually driven by a motor attached to the swinging arm. It is one of the indispensible machines in the structural shop. It has not the drilling power of the usual high speed drill but does not need it, for few of the holes it drills are deep and none of them are large in diameter.

There are often several of them placed in a row, each on a column so that they can cover the entire length of a long truss or girder without moving it.

We are here returning to the equipment which is of particular interest in the automotive shop. It was developed for this use.

The particular characteristics are a series of drilling spindles, the locations of which can

Four-way semi-automatic drilling machine designed to drill forty-two holes in one operation on automobile cylinder castings. The machine drills eighteen holes in the top of the cylinder, eighteen holes in the bottom, ten holes in one end and six holes in the opposite end. Machines of this type are made to drill as many as 95 holes in one operation.

be changed and each of which drives a drill. The piece is placed in a jig and the spindles are arranged to drive a drill which is located and held in exact alignment by the bushings in the jig. These machines will drill all of the holes in the top of a cylinder at once. They are made two-way—meaning that they will drill all of the holes on two sides at once—and also three-way and four-way.

It will be realized the great saving in machining time afforded by the four-way multiple drill which requires but one setting in a jig to do the drilling on four sides and which drills all of the holes in the time it takes to drill one.

With the multiple spindle drill it is the very worst economy to try to work the drilling tools up to their maximum. When any one of the drills becomes dull or broken it is necessary to hold up the operation of all of them until it is replaced. It takes quite a bit of time to reset these machines, so that true economy is found when they are set for speed and feed to give a long time run without trouble or changing.

Drilling machines range in prices from $25 to $5,000 and up. You will get much more than you expect for $25. The $5,000 machine will be just as good value if you have chosen correctly.

As the price of your drilling machine goes up, so does the necessity of caring for it. The high duty, high power machines can tear themselves apart if they are not handled correctly. They need oil, plenty of it in the right places. It is mighty expensive to burn out a bearing. Change gear boxes have been ruined by improper handling.

When one of these machines goes out of commission it makes a big hole in the factory output because the product is used in a lot of machines and unless the parts are in the stock room, assembling cannot go on.

STATE DEALERS ORGANIZE MAY 10-11

Automobile and truck dealers of Michigan will form a state association at a meeting in Detroit, May 10 and 11. Decision to this effect was reached last week at a conference of forty-two dealers from Detroit and other Michigan cities with officials of the National Automobile Dealers' Association. Harry G. Moock and P. F. Drury, general and assistant general manager, respectively, of the N. A. D. A. made a special trip to Detroit from St. Louis to attend the conference. Mr. Moock will return for the May meeting. Guy O. Simons, president of the Detroit Auto Dealers' Association, and a director of the N. A. D. A., presided.

OVERLAND'S MAY PLANS

John N. Willys, president of Willys-Overland, Inc., announced late last week that the company's output for May would be increased by 50 per cent and the working force 30 per cent. The latter means that there will be 8,500 men at work in the Overland plant next month. Mr. Willys denied that there was any truth in the report that Willys-Overland might be absorbed by the General Motors Corporation.

"Our financial position is remarkably good right now," Willys said. "During the last six months we have reduced $7,000,000 in inventories, and by the end of 90 days they will be cut away down.

"A year ago we owed $46,000,000. Now we owe $22,000,000, and have $7,000,000 cash on hand. We have cut $4,000,000 in overhead expenses. Administrative expenses have been cut to the bone. This is based on normal production. The saving now, of course, is even larger. But these expenses will never go back."

U. S. RUBBER ELECTS DIRECTORS

John W. Davis, until lately American ambassador to Great Britain, was added to the board of directors of the United States Rubber Company at the annual meeting, last week. All the other directors were re-elected. In his address to the stockholders Col. Samuel P. Colt, chairman of the board, said: "I still believe and I predict that the number of tires used in the year 1921 will be greater than in 1919 or 1920, or in any previous year in the history of the world, and our company is going to get its share of the tire business, and, therefore, my message to you today is one of encouragement and confidence in the future."

COMPETITION FOR DURANT PLANT

A New York report is that Oakland, San Francisco and Los Angeles, Cal., are doing some spirited bidding for the Pacific coast plant of Durant Motors, Inc., with C. M. Stevens, vice-president in charge of Durant operations in that territory, receiving delegations. R. C. Durant, son of William C. Durant, is in New York, conferring with his father regarding this and other matters.

NATIONAL MEETINGS IN DETROIT

Directors of the National Automobile Chamber of Commerce will meet in Detroit, May 4. The motor truck committee will convene the day previous. Committees of the N. A. C. C. and the National Automobile Dealers' Association will hold a joint meeting at the Detroit Athletic Club, May 6. The manufacturers' committee will consist of W. C. Hills (Chevrolet); C. B. Voorhis (Nash); C. W. Matheson (Dodge Brothers); F. E. Connor (Chandler); Hal P. Bowden (Selden). The dealer body will be represented by Jesse A. Smith, Milwaukee; H. B. Harper, Philadelphia; A. J. Shorey, Boston; F. W. A. Vesper, St. Louis; P. H. Greer, Los Angeles, and N. H. Cartinhour, Indianapolis.

GMC DIRECTORS RE-ELECTED

The board of directors of the General Motors Corporation was re-elected at the annual meeting, held last week at Wilmington, Del.

BRISCOE AT NORMAL BY MAY 1

Clarence A. Earl, president of the Briscoe Motor Corporation, Jackson, has issued a statement in which he says that the corporation's production has increased daily since April 11 and will be up to normal by May 1. "It is very gratifying to note the increased volume of orders coming in from all sections of the country," says the statement.

GOODYEAR'S PRODUCTION

An Akron dispatch to one of the Cleveland newspapers says that the Goodyear Tire & Rubber went on a three-shift daily basis this week, with the output increased from 18,000 to 20,000 tires. Fifteen hundred men had been employed this month up to that time and it was expected that the number would be increased to 4,000 by May 1.

BONNER HEADS F-W-D SALES

The Four Wheel Drive Auto Company, Clintonville, Wis., announces the appointment of D. Henry Bonner, formerly of the Ford Motor Company, as sales manager.

NEW DUPLEX MODEL

T. C. Walden, formerly with the Kelly-Springfield Truck Company, now directs the research department of the sales division of the Duplex Truck Company. He has been making a thorough study of truck facts and performance data since trucks were first put into use. The Duplex company has brought out a new truck for coal dealers, and the first has been sold. The truck is equipped with a metal body divided into two compartments, each having a capacity of one ton. The body has a hoisting device so that it can be mechanically unloaded.

GOODRICH RUBBER ELECTION

The B. F. Goodrich Rubber Company, Akron, at its annual meeting re-elected Mrs. B. G. Work, W. O. Rutherford, Waddill Catchings and H. K. Raymond, directors. A. A. Tilney, vice-president of the Bankers Trust Company, and Harold Stanley, vice-president of the Guaranty Trust Company, were elected to take the places of A. H. Marks and A. B. Jones, resigned. Present officers were all re-elected except H. E. Raymond, vice-chairman of the board, who announced his retirement from all active work. In his place C. B. Raymond was elected.

GMC EXPORT CO. CHANGE

Paul Fitzpatrick, who has been with the General Motors Acceptance Corporation, has become a vice-president and director in the General Motors Export Company and will take up some of the work which has been performed by Peter S. Steenstrup, vice-president and a director of the company. J. Amory Haskell, vice-president of the acceptance corporation, retains the function of president of the export company. It is stated that Mr. Steenstrup will

Digitized by Google

he also known as general manager of export sales and service and Mr. Fitzpatrick as general manager of operations.

KING GETTING READY

Large constructive preparations for the future of the King Motor Car Company, Detroit, have been made during the last few days by A. Weber, president and general manager, and Sales Manager H. Alperin. With the re-joining of J. Emerson as purchasing agent, the company also announces that the Arnold Joerns Company, Chicago, which handled the King advertising several years ago, has been appointed its advertising representatives. This company has just opened a Detroit office in the Kresge building with Bob Davis in charge. Mr. Weber says: "We have been laying our foundation. It has taken a long time, but we are building the future of the King on a solid basis. It is natural that this takes some time, but King will come through it strong and better than ever. We are well pleased with the general co-operation and pledge of support received from King dealers and owners all over the country."

FRENCH DISCRIMINATION

S. A. Miles, show manager for the National Automobile Chamber of Commerce, and who is now in Europe, has been instructed by the N. A. C. C. to take up with the French authorities the question of the Paris automobile show announcement discriminating against American cars at the next Paris show. Application blanks recently received in this country contains the following clause:

"Manufacturers belonging to Allied nations are admitted on the same terms as French firms, provided they have taken part in three previous Paris shows, and on condition that their pre-war import duties were not more than 15 per cent ad valorem."

Under such a rule, American firms do not have the same choice for space as British, Belgian and Italian manufacturers, because the American pre-war duty was the same as at present.

REO ENTERTAINS DEALERS

Reo dealers and distributors from all parts of Michigan met at the Reo factory, Lansing, last week for a school of instruction, and upon their departure drove away 57 new Reo cars and speed wagons. A preliminary meeting at the local branch was followed by a demonstration of the road floater attachment for the speed wagon. The dealers were entertained at a luncheon in the Reo clubhouse by the factory officials at noon. An exhibition of the new Reo industrial film followed. This week the Indiana dealers in the territory of the Fisher Auto Company, Indianapolis, visited the Reo factory under the name of the "Indiana Raiders." They travel by special train, carrying 175 people. They will drive back a like number of cars and speed wagons.

SHAW SUCCEEDS SHERWOOD

Waring Sherwood has resigned as advertising manager of the Briscoe Motor Corporation, Jackson, and has been succeeded by D. Minard Shaw, formerly with the Richards Motor Company, and who since last February has been with Briscoe as a field representative.

NEW ACME PERSONNEL

The Acme Motor Truck Company, Cadillac, announces that W. L. Shaffner, formerly with the B. F. Goodrich Rubber Company, has joined the company and will have charge of the national account division. L. E. Degroat has been made manager of the dealer promotion department. He was formerly with the Timken-Detroit Axle Company.

BECKER NOW WITH SAXON

Carl H. Becker has joined the Saxon Motor Car Corporation, Detroit, as assistant sales manager.

STATE CARTAGE DIRECTORS MEET

Officers and directors of the Michigan Highway Transportation Association, the recently formed organization of cartage interests of the state, met at the Hotel Kerns, Lansing, last Monday, F. Foster Moreton, president of the association, presiding.

Legislative matters were quite fully discussed at luncheon and those present expressed themselves as being pleased with the action taken the week previous by the legislature in tabling a number of House and Senate bills inimical to the interests of members of the Association. President Moreton's appointments of chairmen of various committees of the association were confirmed, as follows: Legislative, H. H. Hardy, Lansing; membership, H. H. Stevens, Flint; furnace, H. G. Beebe, Jackson; auditing, F. H. Stevens, Sr., Saginaw; uniform methods and costs, E. A. Hopperstead, Muskegon; insurance, E. H. Raseman, Kalamazoo; publicity, E. M. Radcliffe, Grand Rapids. The chairmen are to select the other members of their committees.

In the discussion of plans for the formation of local events that each unit should bear the name of the city in which it is located. Thus, for example, the Lansing unit will be called the Lansing Highway Transportation Association.

The directors voted to have an emblem designed which will be seven inches in diameter and star shaped. This will be affixed to vehicles operated by the members.

The question of return loads, together with that of rates and costs, was referred to the committee on uniform methods and costs. Plans will be made whereby these problems may be successfully worked out.

An extensive membership campaign will be inaugurated as soon as proper blank forms can be prepared. The directors will meet in Lansing May 23 to start the drive.

Before the meeting adjourned, late in the afternoon, announcement of the appointments of some of the committee members was made, as follows: Finance, W. G. Stone, Hillsdale, and C. Nielsen, Detroit; auditing, C. J. Foster, Cadillac, and W. G. La Strange, Mt. Pleasant; uniform methods and costs, John W. Frantz, South Haven, and O. A. Alden, Benton Harbor; membership, Guy F. Downing, Lansing; A. H. Shank, Grand Rapids; J. C. Downing, Flint, and D. J. Jeannenett, Ann Arbor.

NEW BUS LINE

Samuel Thompson, Muskegon, has petitioned the Grand Rapids city commission for permission to operate a bus line from Grand Rapids to Kalamazoo on 15-minute service, the route being as follows: Campau Square, Monroe avenue, Sheldon avenue, Cherry, Eastern, Adams avenue to Kalamazoo.

STEVENS BUS LINE EXTENDED

The Stevens Line, between Lansing and Williamston, in operation three years, has been extended to include Howell, and if business warrants, it will take in Farmington to connect with the interurban. The bus arrives in Howell at 10 a. m. and 6:30 p. m.; leaves Howell 7 and 10:30 a. m. and 3:15 p. m.

RED STAR LINE'S NEW ROUTE

Besides its routes from Holland to Zeeland, North Holland, Crisp, Olive Center and Grand Haven, the Red Star Bus Line has put cars on a route between Holland and Saugatuck.

DETROIT-HOWELL-LANSING LINE

R. J. Kocsis, proprietor of the City Cartage Company, has established a regular truck line between Detroit, Howell and Lansing. The first truck left Detroit at 6 o'clock Monday morning and reached Lansing at 1:30 in the afternoon. Trucks will leave Lansing at 6 o'clock in the morning and reach Detroit early in the afternoon. Each truck will have a trailer. The Fireproof Storage & Transfer Company, Lansing, will handle connection in that city. Loads are insured and drivers bonded.

D. T. A. HEADQUARTERS OPENED

The new headquarters of the D. T. A. were formally opened Tuesday evening at 1038 Third avenue with addresses and a luncheon. The Association now has sufficient room for the general offices, meeting hall and reading room, facilities which were impossible in the old Fort street rooms.

DUMP TRUCK MEN MEET

The problems confronting the dump truck business at this time were given a thorough airing at a meeting of the dump truck owners at the D. T. A. rooms Friday evening. With the opening of the building season the demand for dump truck service should increase steadily.

DAIL PLANT ON FULL TIME

The Dail Steel Products Company, Lansing, is operating on a full nine-hour basis with all men who have been with the firm a minimum of six months. The volume of business for March equalled that for the same month last year, while the April business is also holding up well.

HAYNES INCREASES PRODUCTION

A. G. Selberling, vice-president and general manager of the Haynes Automobile Company, Kokomo, Ind., is authority for the statement that the company is making 33½ per cent more cars now than ever before and that 16 per cent more men are employed than at any time in the company's history.

Highway Traffic Assn. in Detroit Convention

Highway engineers, officials of highway departments, automobile associations, motor car manufacturers' representatives and others interested in highway development came to Detroit Friday of this week to attend the annual convention of the National Highway Traffic Association, held in the Detroit Athletic Club. Three sessions, one at 10:30 o'clock in the morning, another at 2 o'clock in the afternoon, and the third at 8 o'clock in the evening, were held and a large amount of business transacted. The program follows:

MORNING SESSION

Chairman of Session: Arthur H. Blanchard, president, National Highway Traffic Association.

Address of Welcome for the State, Frank F. Rogers, State Highway Commissioner of Michigan.

Address of Welcome for the City of Detroit, Dr. James W. Inches, Commissioner Department of Police, Detroit.

Report of Committee on Regulation of Overloading of Motor Trucks: Chairman, David C. Fenner, manager, Public Works Department, International Motor Company, New York City.

Report of Committee on Traffic Center Lines on Roadways: Chairman, E. L. Benedict, vice-president National Steel Fabric Company, Pittsburgh, Pa.

Report of Committee on Equitable Distribution of the Cost of Construction and Maintenance of State Highways: Chairman, Herschel C. Smith, consulting engineer, Oklahoma City, Okla.

Report of Committee on Status of the Construction of Highway Curves and Recommended Practice to Increase Safety to Traffic: Chairman, H. Eltinge Breed, consulting engineer, New York City.

AFTERNOON SESSION

Chairman of Session, R. C. Hargreaves, vice-president, North Central Division, National Highway Traffic Association.

Report of Committee on Widths of Roadways and Sidewalks in Municipalities: Chairman, H. J. Fixmer, paving engineer, Board of Local Improvements, Chicago.

Report of Committee on Motor Bus Service for Consolidated Rural Schools: Chairman, Ernest Parr, chief, Firestone Ship-by-Truck Bureau, Akron, Ohio.

Report of Committee on Highway Transport Clearing Houses: Chairman, Tom Snyder, secretary-treasurer, Indianapolis Transfer Association.

Report of Committee on Highway Transport Franchises: Chairman, F. W. Fenn, secretary, Motor Truck Committee, National Automobile Chamber of Commerce, New York City.

EVENING SESSION.

Chairman of Session: Roy D. Chapin, director, National Highway Traffic Association.

Report of Committee on Interrelationship of Highway, Railway and Waterway Transport: Chairman, Prof. Henry E. Riggs, University of Michigan.

Report of Committee on Relative Efficiency of Different Types of Car Stop Safety Zones and Their Relation to Parking and Ranking Regulations: Chairman, George A. Waters, second deputy police commissioner, Detroit.

Report of Committee on Segregated Traffic Streets in Municipalities: Chairman, Samuel W. Taylor, president, Rider and Driver, New York City.

Report of Committee on Regulations Covering Speeds, Weights and Dimensions of Motor Trucks and Trailers: Chairman, George H. Pride, president Heavy Haulage Co., New York City.

MAXWELL MOTORS SALE BLOCKED

Holmes Jones, Wilmington, Del., stockholder in the Maxwell Motor Company, Delaware corporation with factories in Detroit, has been granted permission to amend his bill of complaint against the company by Chancellor Curtin. Mr. Jones filed a bill of complaint against the company in chancery court, Wilmington, December 11, asking for a receiver for the Maxwell company on the ground that it was insolvent. Mr. Jones charged that "through reckless waste and dissipation" by its officers the company had lost in 16 months $25,933,194. Application for a demurrer being made, Mr. Jones grasped the chance to ask permission to amend his complaint. The United States Court, Detroit, has given permission for a receivership for the company.

TRANSPORTATION NEWS

Rail :: :: *Water*

Detroit—The Wabash Railway Company has appointed H. F. Bobbitt passenger agent in Detroit to succeed Charles Hamilton, who has been granted a leave of absence. The offices are at 1243 Griswold street.

Washington—The Treasury Department announces the payment of $225,000 to the Detroit, Toledo & Ironton railroad under the guaranty provisions of the Transportation Act.

Muskegon—The Goodrich Transit Company is constructing a dock at Maple Grove, near Montague, which will be 200 feet long and 16 feet wide. Up to last year the company's boats stopped at Whitehall, but this port has been eliminated due to the fact that one of the ships became fast on the sand bar last season, and although the people of Whitehall talked about clearing the bar, nothing has been done.

Washington—Claiming that the United States Railroad Administration refused to make any allowance for salt and only $3 a ton for ice used in the preservation of poultry, butter, eggs and cheese en route in refrigerator cars from points in Illinois, Indiana, Iowa, Michigan and Ohio to points in the East, Swift & Company petitioned the Interstate Commerce Commission for reparations allowing $4 a ton for ice and 75 cents per 100 pounds of salt. The I. C. C. has ruled that, inasmuch as the shipper furnished the ice and salt at a time when the Railroad Administration could not, and for its own interests, the allowance of $3 for ice was sufficient and no allowance for salt should be made, and therefore the case is dismissed. The number of the case on the I. C. C. docket was 11,640.

Lansing—A reduction of 25 and 22 per cent in rail rates on sand and gravel for highway building and other purposes except foundries, glass, fertilizer, chemical and cement manufacture, has been ordered by the Michigan Public Utilities Commission, and will not be resisted by the railroads, it is understood. The state commission takes the position that the Interstate Commerce Commission, in fixing the rates, should not have applied the forty per cent increase to sand and gravel. The twenty-five per cent reduction will apply in the Lower Peninsula, and the twenty-two per cent will apply in the Upper Peninsula.

Washington—Reparations to the amount of $86,478.63, with interest, have been allowed the Solvay Process Company and against the Delaware, Lackawanna & Western Railroad by the Interstate Commerce Commission following a hearing on complaint No. 10,363. The bill set out that the railroad company charged the company $30 and $40 a long ton for hauling limestone from Jamesville to Solvay, N. Y., when the charge should have been $25 a ton. The case came up for hearing in 1918.

Detroit—The Hocking Valley Railroad has appointed F. W. Ditman commercial agent for Detroit, with headquarters at No. 704 Free Press building.

Detroit—Absorption of some of the idle labor and road building work are two promising things seen in an active program for Michigan and Ontario by H. O. Halsted, superintendent of car service of the Pere Marquette Railway from the orders for cars that are still coming in and the movement that is already under way. This applies equally to the Pere Marquette lines in Michigan as well as Ontario. The movement of stone and gravel from the various pits and quarries started recently. Shipments are being made from Green Oak, Hersey, Wings, Quarry, the Fostoria branch, Branch and Petoskey in Michigan and Viney pits in Ontario.

Detroit—The Michigan Aero-Service Corporation has been formed here and expects to begin a passenger business May 15. The officers of the company are: Harold P. Ayres, president; Glenn W. Price, vice-president; Harold H. Moyer, James H. Otto and Don W. Sessions, all of Lansing, directors. The object is principally to make inter-city flights. Flying fields have been leased in Lansing, Jackson, Muskegon, Battle Creek, Petoskey and Detroit. The local field is located at the Six-Mile and Evergreen roads, north of Grand River avenue. Ten planes are said to be owned by the company now. In addition to carrying passengers the company will make air photography a part of its business. Only planes and pilots approved by the National Aircraft Underwriters' Association will be used.

POLK OBSERVES ANNIVERSARY

R. L. Polk & Company, Detroit, publishers of city directories and other similar volumes for the last 50 years, observed their half-century mark by issuing a handsome supplement to the Detroit directory entitled, "Detroit Today." The book includes a buyers' guide, history of the city and other information, in the compilation of which the Detroit Board of Commerce and the Detroit Tourist and Convention Bureau assisted.

L. P. HASTY'S NEW CONNECTION

Lloyd P. Hasty, who has a wide acquaintance among members of the advertising profession in Detroit, having been connected with several commercial art organizations in the city during the last four years as sales and service representative, has joined the staff of Howard-Garfield-Gray, artists and advertising illustrators at 1101 Kresge building. He will be in the sales and service end of the business.

OLDS BUSINESS ON BOOKS

The Olds Motor Works, Lansing, has orders for 4,500 vehicles for June delivery, while the April demand exceeds present production. To meet this growing demand more men will be added to the force. The first trainload of any type of machines ever sent into the state of Oregon is being assembled in Lansing for the Portland Oldsmobile Company, Portland, Ore. The shipment will consist of 40 cars, Oldsmobile fours and eights.

AUTOMOTIVE INDUSTRY LEADS

According to a survey made by the metal trades, the motor car manufacturing business is leading all other industries in recovery from depression. The relative positions are: Automobiles, hardware, machinery, builders' supplies, construction material, engineering and repair, boilers, sheet metal, furniture and automobile accessories.

SEEKING OIL IN U. P.

Following the theory that Trenton limestone deposits and the general structure of the earth's surface indicate the possible existence of oil and gas, Dr. W. I. Robinson, Michigan Geological Survey, is making investigations in the Seul Choix Point district, east of Manistique. Ten days will be spent in making this preliminary survey and if the results warrant it, some drilling will be done.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Muskegon—Fifty-eight permits were taken out in March involving an expenditure of $49,258. Of the total, $17,400 refers to new buildings. There were 23 permits for garages, total cost being $4,938.

Kalamazoo—There was a considerable drop in the issuance of permits during the week of April 16, only $4,591 being represented in eight permits. It is believed that the bad weather which has prevailed for some time has had much to do with the slump.

Owosso—The Owosso Canning Company's new plant is being rushed to completion by the Granum-Crosby Company. The warehouse, a structure 48 by 92 feet, is almost completed and work will be started soon on the three-story 51 by 104-foot main building, which will be three stories high, and of mill construction. There will also be a two-story office building and a boiler and procession building.

Detroit—Among the contracts and sub-contracts awarded by architects during the week ended April 21 and which are mentioned by the Detroit Builders' & Traders' Exchange, are the following: A $2,000,000 theater for John H. Kunsky, Inc., to be erected at Broadway and Grand Circus Park, to the Longacre Engineering & Construction Company; the general contract for the coal handling conveyors to be erected at the Detroit waterworks, to the Guarantee Construction Company, New York; general contract on the power station to a high pressure pumping station, to Wolverine Engineering & Construction Company; the general contract for a filtration plant to the Thompson-Starrett Company.

Lansing—The city council has awarded the Brick & Supplies Corporation the contract for furnishing 15,000 barrels of cement to be used by the city in construction work this summer. The bid was $2.32, $2.47 and $2.67 a barrel with the promise of giving the city the benefit of any lower freight rate.

Detroit—The department of public works is the lowest bidder on the work of completing the Belle Isle bridge. The amount of money left to finish the bridge is $2,441,567.88, and the D. P. W. is the only one to bid within that allowance. The bids follow: Department of public works, $2,379,957; Arundel Corporation, Philadelphia, $2,599,522, with from $15,000 to $20,000 additional for waterproofing; Great Lakes Dock & Dredging Company, Detroit, $2,943,541.

Detroit—The Detroit police department has instructed Albert Kahn, architect, to advertise for bids on a new headquarters building, to be erected adjacent to the Municipal Courts building. The structure will be 10 stories high and will cost $1,500,000.

Lansing—Since the announcement has been made that a 10-story office building will be erected here by the Prudden Building Company, applications have been pouring in for space until the company now has enough on file to tenant the structure. No action has been taken on them. The first five floors will be occupied by the Dancer-Brogan Company, while another floor will be taken by the J. W. Bailey Company and Michigan Mortgage Corporation. Work on the excavation is being pushed by the Rickman Construction Company.

Detroit—The common council has approved of an appropriation of $1,656,032 to complete the Cass Technical High School building. The structure, which will be seven stories in height, will extend along Second boulevard from High street to Henry street. The present Cass Tech building at Second boulevard and Grand River avenue will be connected with the latter building by an arch.

Detroit—The board of education has awarded to Culbertson & Kelly, Detroit, the contracts for the erection of additions to the Estabrook and Sampson school buildings, the former involving an expenditure of $119,946 and the latter $116,421. The work is to be completed by September 15.

Mount Clemens—Cost of buildings or alterations as represented by permits issued during March is estimated at $47,475. This is considerably better than the February record.

Detroit—The Detroit common council has decided to allow the public light commission $50,000 to defray the cost of preparing plans and specifications for a power plant. The item was cut out of the 1921 budget, but will now be included in the appropriations for 1922.

Escanaba—At least thirty houses are under construction here and permits for more are being taken out practically every day. The Escanaba Press says that it is recognized that the prices of material are at their lowest possible levels and men familiar with market conditions are unanimous in declaring that there is certain to be an upward trend before long. One contractor is quoted as follows: "We have had a hard time convincing the people that costs of material really have trembled. Some insist on making their own investigations. That was all we wanted. Building costs are down. They are lower now than they are likely to be in a few months."

Detroit—During the week ended April 23, 306 permits were issued involving an expenditure of $989,335, as compared with $1,668,265 for the week of April 16, and $5,894,020 for the corresponding week in 1920. Of the total expenditure, $938,495 is credited to 235 new construction jobs and $60,840 to 71 alterations or additions.

Purchasing Agents' Association of Detroit,

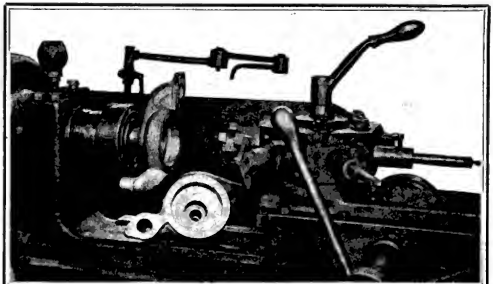
1921 Michigan Pikes Tour Plans Being Formulated

The Michigan Pikes Association, which this year is under the presidency of Fred S. Case, Sault Ste. Marie, already is making active preparations for its sixth annual Pikes tour, scheduled to start from Detroit the second week in July.

The 1921 expedition, according to Mr. Case, will be the banner event of its kind in the history of the Association. In equipment, personnel and route to be covered, it will exceed even last year's trip, which was the first international journey of its kind ever conducted. In 1920 the Pikers utilized a fleet of forty-two motor cars and seventeen trucks to transport 250 persons, including the Ford Motor Company's band, from Detroit to Toronto, north to Sudbury and through the wilds of northern Ontario, crossing back into Michigan again at the Soo and returning to Detroit over the East Michigan Pike.

For the 1921 jaunt, Tour Manager W. D. Edenburn has laid out another trip that is to forge another international touring link for the motorists of both Canada and the United States. It is styled the "Around Lake Superior Tour" and will cover 1,700 miles in fifteen and a half days.

Plans now call for the use of 80 motor cars and trucks to accommodate at least 250 persons on the two weeks' haul. As the big convoy passes through the country it will provide an object lesson in motor transportation to every community on the road. The truck section of the convoy, which serves as the auxiliary of the motor car section, will mount on separate vehicles electric lighting equipment, fire prevention apparatus and ambulance service. Trucks also will be used to convey the tourists' baggage, blankets and cots.



Necessity of camping out on the 1921 tour will be obviated by reason of the fact that the tour passes through well settled territory where sleeping accommodation at the night controls can be obtained in armories or other large public buildings.

As in previous years, every point on the route is to be the scene of a good roads rally with a brass band and the arrival of the touring party to attract the crowd. The corps of speakers, which will be under the direction of Captain W. S. Gilbreath, manager of the Detroit Automobile Club, will be an all-star aggregation.

Manager Edenburn advises that the Steamer Noronic has been engaged for transporting both men and automobiles from Port Arthur and Fort William to the Soo on the return leg of the journey. It was originally planned to ship the automobiles via boat and transport the men by special train.

HANNUM TO MANAGE OAKLAND PLANT

George H. Hannum, general manager of the Saginaw Products Company, Saginaw, will succeed Fred W. Warner as general manager of the Oakland Motor Car Company, Pontiac. Mr. Warner has resigned after seven years with the Oakland company, but will retain his connection with the General Motors Corporation as vice-president and director. Both the Saginaw Products Company and the Oakland Motor Car Company are subsidiaries of the General Motors Corporation. Mr. Hannum was formerly connected with the Detroit Lubricator Company, Detroit, but went to Saginaw in 1912 as shop superintendent of the Wilcox Engineering Company, one of the first plants taken over by the GMC. He is president of the Saginaw Board of Commerce, director of the Bank of Saginaw, vice-president of the Saginaw Shipbuilding Company and director of the Saginaw Financing Corporation.

The hub of this Cast Iron Water-Circulating Pump-Body has been turned and drilled on another No. 4 Turret Lathe. The tools on this No. 4 rough bore and true up for shaft, ream to size, counter-bore for clearance and finish bore and face large diameter—all in 5½ minutes. Most of these tools are standard.

Proper Tools for Turret Lathes

DETROIT, SATURDAY, APRIL 30, 1921

The Comeback of Mr. Durant

NOT many weeks ago when this paper commented upon the loss of control of the General Motors organization by Mr. William C. Durant, it indulged in a prophecy that it would not be long, very likely, until we heard more of Mr. Durant. The reasons set up were that he was a man still in the active years of life, had great powers of organization, and had the prestige of success.

Publications which have been made in the Manufacturer in the last two or three weeks seem to have indicated that that prophecy has come true almost earlier than we expected. Mr. Durant has erected a new motor car company, the plans for which involve factories on the Atlantic and Pacific coasts, and for the midwest in his favorite city of Flint. That city was the scene of his early industrial successes before the motor car had come across the horizon. He established the principle of quantity production there, it is true, only as applied to cheap vehicles, but Flint was the vehicle city of the country long before the motor car was dreamt of as the foundation of a commercial business.

There are many people who indulge in speculation as to what the future of the motor car industry is going to be in this country. Whatever else it may be, it seems now that it is not going to be a survival of individual small factories producing small quantities of product, making service difficult on the country-wide basis and requiring as much capital for spare parts for service purposes as is required to maintain the central factory.

We have seen several aggregations of manufacturing units grow into greater ones. The foremost of these was the General Motors. Several former organizations are represented in the existing one of the Studebaker; as several more are represented in the rapidly completing reorganization of the Maxwell-Chalmers Company. It would seem that the tendency in motor car manufacturing is toward the manufacture of "lines," so called, which include variety of product, of high and low costs, with which it is desirable to consolidate the manufacture of motor trucks, thereby reducing sales expense and service cost to the minimum by spreading them over the largest possible area.

It is not at all unlikely, although no information has been given out to that effect, that Mr. Durant's new organization will take account of the existence and development of earlier types of cars, consolidate their manufacture under good engineering and sales organizations and produce something along the lines of the products offered by the General Motors Corporation. If such a project can be financed in this or later days, it means a great deal to the industry in Michigan, not only by putting into the state the midwest factory of a great organization, but by furnishing a recourse for meritorious or illy-capitalized organizations, which really need a safe financial harbor in which to land.

We do not know Mr. Durant's plans, but we do know that he is in the saddle again. That is as much as the Manufacturer predicted a few weeks ago, and it is no more than those who admired this Michigan industrialist's genius of organization wish for him, and those who associate themselves with him. He has been one of the great figures in industry in the country, is the product of Michigan, and Michigan people are proud of him.

What Is a Lease?

THE recent decision of the Supreme Court of the United States on the subject of leases leaves some very interesting questions in the air.

In a case growing out of a housing situation in the District of Columbia, wherein the Congress of the United States determined that housing was affected by a public interest and that, therefore, a tenant whose lease had expired, or who was in relation with his landlord from month to month, might refuse at the expiration of his stated period of tenancy to pay a higher rate of rent without the same becoming a subject of legal review, the court decided that such a theory was entirely in harmony with our constitution.

It is rather significant that four members of a court which does not usually express itself strongly, found it necessary in a dissenting opinion to ask striking questions as to whether or not the constitution and the guaranteed rights of property owners in this country had become anachronisms.

It is true that the defenders of the recent opinion of the court qualify it as applying in principle only to the District of Columbia, and perhaps to a New York tenancy case which seems to have been collaterally involved. But already legislatures throughout the country are being besought to pass laws which will have as their basis this opinion of the court. It will be noted by those who read the opinion closely that the decision of the court is based upon the principle that the Congress may definitely and finally decide that housing is affected by the public interest and that this phase of the matter is not to be controverted by the court. If that be so and the reasoning be carried to its conclusion, then Congress or the legislatures for their respective states —because Congress in the District of Columbia case assumed to act as the legislature of the District of Columbia—have only to determine that the business of grocery-keeping or of selling shoes, or of running general stores, is affected by the public interest in order to make possible a judicial review of the rentals asked from tenants of places of business fitted for such purposes.

We have seen somewhere a criticism of the opinion to the effect that long leases have been rendered unstable by the decision, but this does not seem to be within the logic of the opinion of the majority of the court, because it has only applied its rule to cases where the contract has expired. Yet conceding so much as the majority of the court has conceded, it is not an impossible step, which it is hoped will never be taken, for a case to be framed during the period of a lease, in which the conditions of prosperity are altered, seeking to reform the laws and reinstate the cost of tenancy.

One thing is certain, and that is not two, and it is that a very severe blow has been dealt industrial cities by this decision, and will be dealt in whatever state the legislature of which assumes to declare that the tenancy of houses is affected by the public interest. It may be that a landlord does not control his property

Digitized by Google

absolutely, and may not set the price at which he will rent it. The farther step that has been suggested that the courts may order the making of leases may possibly come to pass, but it never can be held, so long as this republic remains free, and the disposition of private capital may be controlled by its owners, that people who have money can be forced to invest it for rental property for housing purposes.

Now the supply of houses is a commodity that has limits. They become antiquated or obsolete and the demand for them in industrial cities is constantly growing. If there is no surety of income based upon the operation of the law of supply and demand for those who invest their money in houses, there will not be many more houses built, and industrial cities that have attained one stage of growth cannot advance to another and a great one. Once the application of the rule laid down by the federal supreme court is further defined and limited, so that for instance, vote-seeking politicians in Michigan can pass laws, assuming to affect housing with a public interest, and thereby gain control of month-to-month and short-time tenancy, there are not going to be many more houses built in Detroit, Grand Rapids, Jackson, Flint or any other of our growing cities, until the rule is very definitely restated, so as to make it very clear that there is to be whatever return from investment from house-building and house-owning that grows out of the operation of the law of supply and demand. House-building, both from the standpoint of investment and from the standpoint of furnishing a market for the labor and material that enter into the operation, is going to experience a serious setback.

Cured

DR. MORRIS ZUCKER, of Brooklyn, who last June was pardoned by President Wilson after having been sentenced to spend fifteen years in the penitentiary for sedition against the United States, sailed for Russia in September "to ascertain," he said, "whether under the soviet form of government there was a real dictatorship of the proletariat or of a handful." He found out. On presenting himself to the red authorities at Moscow he was told that it would be inadvisable for him to conduct his investigation and that he would be sent out of Russia shortly. Meanwhile he would have to spend his time in jail—which he did, until March 27. It was while incarcerated that he did his investigating. He is entirely satisfied with his conclusions and says he is coming back to the United States "to disillusion those who think there is anything like freedom under the soviets."

Inside the prison, Zucker says, he met victims of bolshevik "freedom" of every sort and condition. Former grand dukes rubbed tattered elbows with former workmen, all of them having been locked up on scant rations because they spoke out in meeting against the red terror. They were a hungry, dejected, sorry looking lot, but were hardly more discouraged than the mass of the people on the outside, who could not be sure of a meal a week, let along the one or two crusts a day which the prisoners usually were fortunate enough to lay hands on. Most of the prisoners were dragged with great regularity into star chamber sessions, where, under threat of death, they were invited to confess to crimes of which none of them were guilty. Many, worn out physically and mentally, and believing death could be no worse than imprisonment, did confess, and the punishment meted out made a Roman holiday for the bolsheviki.

"That's the way they do with everybody," says Zucker. "Their opponents are imprisoned immediately. The bolsheviki are finding peace more dangerous than war."

Zucker, who was one of the organizers of the communist party in the United States, is pretty well cured of the notion. So is Emma Goldman, who, if reports from Russia are to be believed, would give twenty years of her life if she could only return to the land which for so many years she reviled. It might not be a bad idea to crate as many of the red agitators in this country as could be carried by the Atlantic fleet on a couple of voyages and then ship them to Russia for a few months' close communion with the system they so loudly are espousing here. Such of them as survived would come back missionaries for law and order as it is maintained under the American form of government.

Short Measure Stuff

The Chicago Tribune declares 1921 will reward fighters. How, with another bonus?

* * *

Says a want ad: "Man speaking German, to work in sausage department." They must use nothing but dachshunds.

* * *

We hope not too many American leaguers try to get even with Cobb.

* * *

This year's styles have dissolved one mystery of long standing. We can now tell at a glance whether they are knock-kneed or bow-legged.

* * *

And now in Ontario also, it's all going out and nothing coming in.

* * *

MORAL QUATRAIN

Apostles of scrappiness, hark to my lay,
Or you may recall it with sorrow:
'Tis better to patch up a quarrel today
Than patch up a black eye tomorrow.
—Louge, in Cleveland Plain-Dealer.

And pacifists, too, here's more wholesome advice,
Preparedness should not diminish;
'Tis best to be always in good fighting trim,
And then don't start what you cannot finish.

* * *

And meanwhile, the Allies are waiting for their cup of indemni-tea.

* * *

JAZZING UP THE OLD FARM

to place one of these new-fangled amplifiers in every farmhouse where the electric lines travel and put on a jazz band and a cabaret at the power house. Then the boys could make cider to the tune of "The Alcoholic Blues." Pa could call for "Razzing the Dog" when he makes sausage. Sister could phone for something sentimental on the night that her bashful beaux calls. And on the day the taxes have to be paid, it would be most appropriate to play, "Carry Me Back to Old Virginny."

—A. F.

The general tie-up of British industry threatened by the so-called "triple alliance" of miners and railway and transport employes has failed. When it comes to a choice between organized government and organized browbeating, public opinion in 1921 is siding with organized government. And public opinion is the controlling force in any situation.

When the Railroad Labor Board announced the abrogation of the national agreements between the roads and their employes it signalized the first step in the real return of the transportation systems to their owners.

A Buffalo man was driven insane trying to make out his income tax blank. Write your own comment.

FINANCIAL

General Motors Annual Report and Statement

PRESIDENT Du PONT, of the General Motors Corporation, in his annual report for the fiscal year ended December 31, 1920, reviews the development of the automotive industry from 1899. Lack of space prevents giving the full report but several points of interest are covered below. Mr. du Pont says in part:

"The history of the General Motors Corporation parallels in a general way the greater development. The statement of July 31, 1912, compared with December 31, 1920, sufficiently reveals the great progress that has been made. Thus we find the following comparative items:

	1920	1912
Net working capital	$144,452,796	$20,986,895
Capital expenditures charged to plants and investments	70,668,217	2,124,181
Fixed assets in plants	247,748,765	19,280,888
Miscellaneous investments	67,965,100	569,200
Good will and patents	14,814,813	9,000,000

"The Corporation has not grown by the issue of securities only, for during the period from 1912 to 1920 there has been invested out of earnings $128,070,238 and the corporation has received in cash through sale of securities, largely on stockholders' rights, $130,826,635, a total cash capital paid-in of $258,896,873. It is encouraging that the accumulated earnings and the cash subscriptions of the new investors have added so largely to the Corporation's development, showing on the one hand strength in earning capacity, and on the other faith in the investing public in the stability and prospects of the industry.

"The growth of the business is further reflected in the increased production of cars and trucks. In the year ended July 31, 1912, 50,070 units were produced, in the year 1920, 401,610 units. At the height of the 1912 season, 11,474 were employed in the factories. In 1912 this had risen to 16,984. In the height of the manufacturing season of 1920 the total employes had risen to 97,576.

"It is not possible to state accurately the percentage of the parts of any automobile manufactured by the General Motors Corporation, but the field has been developed to insure an ample supply. Such additional quantities as may be needed can be purchased to advantage, so that no further substantial investment in facilities for the manufacture of parts will be necessary at a nearby date.

"It has been thought unwise to undertake production of materials that do not relate largely to the automobile. Thus a comparatively small portion of total tires produced are consumed by the automobile manufacturer, the larger percentage being sold directly to users of cars for replacement purposes; the greater part of the production of sheets and other forms of steel is consumed by trades other than the automotive industry; therefore investment in these fields has been made. By the pursuit of this policy the Corporation has become firmly entrenched in lines that relate directly to the construction of the car, truck or tractor, but has not invested in general industries of which a comparatively small part of the product is consumed in manufacture of cars.

"The rapid development of the industry has called for equally rapid changes in the character of manufacturing plants, but by constant reinvestment and rebuilding the Corporation has kept well in advance and its factories may now be considered in satisfactory condition. The great plant of the Cadillac division, in Detroit, which will be fully occupied in the summer of 1921, is the last large item of construction to be finished. There still remain several small and somewhat antiquated plants that have been reingated to minor manufacturing or assembly purposes, but these items are of little consequence and may be abandoned at a not distant date.

"The growth of business has necessitated repeated enlargement of office force and office facilities, finally culminating in the acquisition of the General Motors building at the corner of Broadway and Fifty-Seve th street, New York, and the erection of the General Motors building, covering the entire block bounded by Grand Boulevard West, Cass avenue, Milwaukee avenue and Second boulevard, in Detroit, which is practically completed. The interior of one-half of the building is nearly finished and will soon be entirely occupied by the Corporation. It is intended that the interior of the other half will be finished as the expansion needs of the Corporation demand additional space but it may be finished sooner and rented temporarily to other tenants."

The progress of the earning power of the corporation's properties and the disposition of the resulting cash is of interest, and follows:

	General Motors Proportion of the Net Earnings before Federal Taxes	Federal Taxes	Dividends	Interest Retained in Business
1920	$ 87,348,392	$ 8,000,000	$29,117,722	$ 14,230,669
1919	91,182,222	30,000,000	22,715,792	28,466,430
1918*	81,205,197	15,375,546	14,184,296	1,647,355
1917 (Aug. 1 to Dec. 31)	17,165,156	2,840,274	2,786,189	13,508,393
1917	28,540,928	4,652,316	8,165,872	16,201,650
1916	18,812,305		7,801,650	17,010,655
1915	16,796,690		1,387,851	13,408,839
1914	5,642,904		1,541,896	4,201,008
1913	8,541,494		2,130,557	6,410,937
1912	5,166,557		2,252,474	2,954,003
Totals	$382,003,295	$60,368,136	$94,423,800	$128,070,238

*Years 1912 to 1917 are fiscal years ending July 31; years 1918, 1919, 1920 are calendar years.

Earnings retained in business to July 31, 1917, were capitalized through the issue of common stock.

DISTRIBUTION OF STOCK OF THE CORPORATION.

The following statistics in regard to the number of stockholders are of interest:

Year Ended	First Quarter.	Second Quarter.	Third Quarter.	Fourth Quarter.
Dec. 31, 1917	1,977	2,175	2,460	2,900
1918	3,910	3,777	3,615	4,729
1919	8,013	12,035	12,258	16,716
1920	24,143	26,126	31,029	36,804

SALES.

The net sales of the corporation for the year 1920 were $567,320,603, being an increase of $57,643,909 over sales for the preceding year. The net income was $93,150,308, from which, however, there has been deducted $47,766,787 to cover various items, including Federal taxes, net write down inventories, full depreciation of plants, and for amounts written off in connection with operations conducted by the corporation pursuant to its policy of assisting employes to buy and own their own homes. The net profits, after these charges were made, were $45,383,521. In addition to the abovementioned deductions, reserves previously set up were utilized, with a view to providing for all contingencies and towards writing down the value of inventories and other accounts to a level which is unquestionably conservative.

INVENTORIES

The motor car business, in common with other lines of manufacture, suffered acutely from the conditions which obtained during the last four months of the year. The demand for the corporation's products, which had been very urgent during the first part of the year, was sharply curtailed in September. Inventories reached their peak about the middle of October, but during the ensuing ten weeks, to December 31st, the corporation was able, notwithstanding shrinkage in sales, to effect a net reduction in inventories of approximately $25,000,000. In addition, inventories were further reduced $25,776,112 at December 31, as a result of charging off all obsolete materials as well as adjusting values to cost or market, whichever was the lower.

SPECIAL RESERVE FOR UNFORESEEN CONTINGENCIES.

While all known losses and appropriate writedowns of inventories have been taken care of in closing the books as of December 31, 1920, nevertheless it has been deemed advisable to set up a special reserve of $7,500,000 to take care of possible losses in respect to outstanding commitments for materials undelivered and for the other unforeseen contingencies. This item is applied as a special charge again earnings of the year 1920 and appears in the statement of income following.

INVESTMENTS IN ALLIED AND ACCESSORIES COMPANIES, ETC.

Included in investments, totaling $67,985,100 on the balance sheet, are the corporation's holdings in the following companies:

Bearings Service Company ..... Detroit Michigan
Brown-Lipe-Chapin Company, Syracuse, New York
Desbler Die Casting Company, Brooklyn, New York
Fisher Body Corporation ..... Detroit, Michigan
General Leather Company ..... Newark, New Jersey
General Motors Acceptance Corp., New York, N. Y.

CONSTRUCTION.

The construction program, inaugurated in recent years, was about completed during the year 1920 by the expenditure of approximately $79,161,951. There remains for expenditure during the year 1921, the sum of $19,521, on authorized appropriations or approved projects, which will complete the building program. No further large appropriations for construction are needed in the near future.

DIVIDENDS.

The regular dividends on the preferred and debenture stock have been paid during the year and also $1.05 in cash and three-fortieths shares in stock to each outstanding share of General Motors Corporation common stock. A detailed record of the quarterly dividend payments during 1920 is as follows:

Dividends Cash, Common Stock (Stock par value);	Period.	Payable.	Stock of Record.
$2.00	Quarterly	Feb. 2 1920	Dec. 31 1919
2.50 ¼ share	Final	May 1 1920	Apr. 5 1920

1.75	Quarterly	Nov. 1 1920	Oct. 5 1920

Digitized by Google

THE OUTLOOK.

In the early months of the year 1920 there was promise of increasing annual sales and net profits. As stated above, the volume of sales reached this expectation notwithstanding the sudden diminution of business during the latter quarter of the year, but the net profits fell somewhat short of the previous year's record, although far in excess of any other year of the corporation's history. The dullness of the latter months of 1920 has continued during the early months of 1921, but as this report goes to press there is evidence that the year will show a substantial recovery and a reasonably satisfactory business with foundation well laid for future prosperity.

CONDENSED COMPARATIVE CONSOLIDATED BALANCE SHEET OF GENERAL MOTORS CORPORATION AND SUBSIDIARY COMPANIES AS OF DECEMBER 31, 1920 AND 1919.

ASSETS—	Dec. 31 1920.	Dec. 31 1919

MANAGED BY MEN YOU KNOW

Why Stake Your Family's Security on Human Frailty

Not a week passes but fresh evidence appears of the improvidence of appointing an individual executor or administrator.

Friends, though well-intentioned, often make costly mistakes through inexperience. Some prove subject to influence, and prejudice creeps into the management, with resultant quarrels.

Far better, mature business men decide on consideration, to appoint an impartial, trained agent such as the Grand Rapids Trust Company, proof from human ills.

A booklet prepared on this subject will prove interesting. Send for copy.

Banks and Bankers

WIXSON JOINS MANNING

Roscoe C. Wixson, well known to many of the bankers of Michigan, and who for the last four years has been Detroit manager for the Detroit & Northern Michigan Building & Loan Association, has resigned his position, effective about May 15, to join Albert E. Manning in the Michigan Finance Company, Flint. Wixson served as a cashier under Commissioners Doyle and Merrick, from which connection he came to Detroit four years ago.

NEW CENTRAL SAVINGS BRANCH

The west side ground floor space of the G. A. R. Memorial building, Detroit, is undergoing alterations preparatory to occupancy by a new branch of the Central Savings Bank, about June 1. The Central Savings Bank and First & Old Detroit National Bank are under one ownership.

BANKERS' CONVENTION PROGRAM

President John W. Staley, of the Michigan Bankers Association, is grooming up some unusually attractive speakers for the annual convention in Detroit, June 6 and 7. We are not at liberty to divulge the names of the speakers at this time but it suffices to say that any Michigan banker who misses this convention will regret it. The program includes only men of nation-wide reputation whose messages will have unusual value to the banking fraternity.

The sessions this year will be limited to two days in the interest of conserving the time of the busy banker, and promoting 100 per cent participation in all the activities of the meeting.

NATIONAL BANK BRANCHES AGAIN

Senator Frelinghuysen, according to Washington advices, has introduced a bill in the Senate to permit national banks to open branch offices under certain conditions. By the terms of the bill, in cities with population of between 25,000 and 50,000 two branches may be opened; between 50,000 and 100,000, three; in cities over 100,000, four branches, which is the maximum. The bill also provides that the capital of the bank shall be increased not less than an amount equal to 50 per cent of the minimum capital necessary for the organization of a new national bank in each city, for each branch so established.

PROCTOR IS CASHIER AT EVART

Harry W. Proctor, for many years in charge of the Fairview branch of the American State Bank, Detroit, and also an assistant cashier, has become cashier of the Evart Savings Bank, Evart, succeeding J. A. Hall.

LIVINGSTONE SUCCEEDS CRIMMINS

It is reported in the Charlevoix Sentinel of April 21 that Archie L. Livingstone, since July 1, 1913, assistant cashier of the Charlevoix State Savings Bank, will succeed Alvah D. Crimmins as cashier. Livingstone has a wide

Digitized by Google

acquaintance in Charlevoix and is in close touch with the business and customers of the bank and the promotion comes in recognition of his efficient and faithful services.

GRAND RAPIDS SCHOOL SAVINGS

Reports made public by the Grand Rapids banks March 31 show that school children who have been depositing money in the banks through the medium of 50-cent savings stamp purchases for the last few years have accumulated $90,625. A newshoy who has saved $575, most of which represents his earnings from carrying papers, is the largest depositor. The number of children depositors grew from 6,000 on June 2, 1919, to 9,500 in June, 1920, and the total March 31 was 10,000.

PACKARD LEAVES NATIONAL UNION

It was announced in Jackson last week that R. A. Packard, vice-president of the National Union Bank, had resigned to become manager of the bond department of Webb, Lee & Company, and that L. B. Chapple, for several years manager of the east side branch of the National Union, will become resident manager of Webb, Lee & Company in Jackson.

SUNSHINE BONDS SELLING WELL

E. L. Withey, of the Grand Rapids National City Bank, advises that more than half of the "Sunshine" hospital bonds have been subscribed for. The Owens-Ames-Kimball Company, which will put up the building, has taken $120,000.

BISHOP OFFERS SAVINGS PLAN

President Arthur G. Bishop, of the First National Bank, Flint, has announced a savings plan which should appeal to the thrifty as well as to those who customarily take in the good things in life. Anyone who cuts out a coupon published in the Flint Journal and presents it with 50 cents at the First National may open an account credited with $1, and he will be presented with a Liberty Bell home savings bank. The only string attached to the offer is that the depositor must make an additional deposit of 50 cents within six months. Failing in this, the 50-cent coupon will be deducted when the account is closed and the Liberty bell bank must be returned.

DETROIT SAVINGS' NEW BRANCHES

The Detroit Savings Bank opened two new branches, April 18, one at Warren avenue and Junction and one at Hamilton boulevard and Collingwood avenue. This makes a total of 18 branches now in operation.

Bank Personals

E. A. Blakeslee, president of the Commercial National Bank, St. Joseph, died April 21. Mr. Blakeslee was a well known figure in banking circles in western Michigan.

O. B. Hipp, president of the Farmers and Merchants National Bank, Benton Harbor, is back on duty after spending a pleasant vacation in Florida.

L. R. Barnes, cashier of the First National Bank, Boyne City, was a Detroit visitor a few days ago.

The Commercial National Bank, St. Joseph, is putting up a fine new building on the site it has occupied for many years.

The American National Bank, Benton Harbor, of which W. F. Dowland is cashier, has purchased the corner adjoining the Benton Hotel and shortly will remodel the structure as a modern bank building.

Edmund D. Fisher, former vice-president of the Bank of Detroit, leaves this week for Washington, D. C., to become chairman of the metric committee of the United States Chamber of Commerce, which committee will undertake some special investigations. Mr. Fisher will be absent from Detroit three or four weeks on this mission.

AUTO BODY TO ISSUE STOCK

The Auto Body Company, Lansing, plans distribution of $600,000 additional common stock, which, it is stated, will be made in the very near future. Pending execution of these plans the company has requested removal of both preferred and common issues from the listed board of the Detroit Stock Exchange. The report states that both issues will be reinstated when the new stock has been distributed.

AMERICAN LOAN EXPANDS TRUST DEPT.

The American Loan & Trust Company, Detroit, announces the appointment of Fred M. Breen, of Cadillac, as trust officer and it is stated that the company will seek additional trust business with its increased personnel and facilities. Mr. Breen has been judge of probate of Wexford county for nine years, and was probate clerk of the same county three years and is well equipped by experience and legal training to handle the trust department of the company. He is an attorney and is president of the Probate Judges' Association of Michigan and has made a special study of probate law.

FRED M. BREEN

In 1912 he gained considerable notice throughout the country when on being elected probate judge of Wexford county it was learned that he was the youngest probate judge in the United States. His legal experience includes service as United States commissioner since 1912, and circuit court commissioner for three terms. As probate judge he has handled many of the estates of the large lumbermen of northern Michigan. It is said that there has been only one appeal from his probate decisions and that was sustained by the higher court.

This addition to the business equipment of the American Loan is in line with the progressive policies of that institution which have been noticeable the last two or three years. A stock transfer department is another recent addition. The company heretofore has handled a few receiverships and has done a limited business in handling estates but has not exercised to any extent the trust powers granted it under its charter. Since 1906 the company has underwritten about $25,000,000 of first mortgage bonds, which have been sold to small investors in denominations of $50 and $100.

Detroit Stock Exchange

The official Detroit Stock Exchange list is omitted this week because changes since last week have been insignificant. There were sales the first time this year of Edmunds & Jones preferred and Kresge common, the former at 70 and the latter at 141. Motor Products moved up from 43 to 52, presumably on publication of the annual statement, which showed an unusually splendid condition.

Liberty bonds changed but little during the week, the greatest change being in the 3½s, which dropped from 89.90 last Wednesday to 88.50 Wednesday of this week.

McPHERSON SUCCEEDS MERRICK

Advices from Lansing Wednesday were that Governor Groesbeck had accepted the resignation of F. W. Merrick as state banking commissioner and had appointed Hugh McPherson, of Howell, as Merrick's successor. Mr. McPherson is a widely known banker in Michigan, having been connected with the McPherson State Bank of Howell for many years. Mr. Merrick's letter of resignation appears on another page of this issue.

COST ACCOUNTANT

Twelve years practical experience, thoroughly conversant with manufacturing costs. Can install systems and take full charge of work. References furnished. Box P, Michigan Manufacturer & Financial Record, 611 Free Press Building, Detroit, Mich.

$230,000,000
(Total Issue)

Northern Pacific - - - Great Northern

Joint 15-Year 6½% Convertible Gold Bonds

(C. B. and Q. Collateral)

To be dated July 1, 1921 | **Interest Payable January 1 and July 1** | **To Mature July 1, 1936**

Convertible at any time, at the option of the holder, as more fully described below, into 6% Bonds of the Northern Pacific Railway Company and/or 7% Bonds of the Great Northern Railway Company

Redeemable, at the option of the Companies, as a whole or in amounts of not less than $5,000,600, at 101½% and accrued interest at any time on 75 days' notice. Any Bonds called for redemption, in order to be converted, must be presented for conversion fifteen days before the redemption date.

Coupon Bonds in denominations of $1,000, $500 and $100, with privilege of registration as to principal. Fully registered Bonds, in denominations of $1,000 and authorized multiples thereof. Coupon and registered Bonds and the several denominations interchangeable.

THE FIRST NATIONAL BANK OF THE CITY OF NEW YORK, Trustee

The following summarized description of these Joint 6½% Convertible Bonds has been prepared for us by Howard Elliott, Esq., Chairman of the Northern Pacific Railway Company, and Louis W. Hill, Esq., Chairman of the Great Northern Railway Company, from their letter to us dated April 25, 1921:

Security The Joint 15-Year 6½% Convertible Bonds are to be the direct and joint obligations of the Northern Pacific and of the Great Northern Railway Companies, and are to be secured by a pledge of 1,658,674 shares (approximately 97% of the outstanding stock) of the Chicago, Burlington and Quincy Railroad Company (which percentage of stock has heretofore constituted the sole collateral security for the maturing "Burlington Joint 4s"), and in addition by $66,000,000 of mortgage bonds of the two obligor Companies, the deposited collateral being valued at an amount in excess of 120% of the principal amount of Joint 6½% Bonds to be issued.

Conversion Privileges The Joint 6½% Bonds may be converted, par for par, without charge, at the option of the holder at any time (upon presentation not later than fifteen days before maturity or earlier redemption), into 6% Refunding and Improvement Mortgage Bonds (Series B) of the Northern Pacific Railway Company, due 2047 (callable after 15 years at the Company's option at 110% and accrued interest), or into 7% Fifteen-Year General Mortgage Bonds (Series A) of the Great Northern Railway Company due 1936 (with no option of prior redemption), or into bonds of both issues in any ratio between the two which the holder of the Joint 6½% Bonds may desire, but not more than $115,000,000 of either of such mortgage bonds will be issuable upon such conversion.

Legality
for Savings Banks and Life Insurance Companies

Such Northern Pacific Bonds are, in the opinion of counsel, a legal investment for savings banks and trust funds in New York, Massachusetts, Connecticut and Vermont. Both such Northern Pacific Bonds and such Great Northern Bonds are, in the opinion of counsel, a legal investment for life insurance companies in the state of New York.

Earnings During the ten and one-half years from 1911 to 1920 inclusive, the combined average surplus income of the Northern Pacific and Great Northern Railway Companies, after payment of combined fixed charges, other than the interest on the outstanding joint bonds which are to be refunded by the new issue, was about $44,000,000 annually, and, in addition, the share of the two roads in the surplus income of the Chicago, Burlington and Quincy Railroad Company, after the payment of its fixed charges, averaged about $20,960,000 annually, the total annual average being about $64,960,000 as compared with $14,950,000 which will be required annually for interest on the new issue of Joint 6½% Bonds.

Equity—Since July 1, 1901, the Chicago, Burlington and Quincy Railroad alone has increased its surplus in the amount of approximately $200,000,000, against which no securities prior to the stock have been issued. The combined net assets of the Northern Pacific and the Great Northern, after deducting their prior debts, together with 97% of the net assets of the Chicago, Burlington and Quincy Railroad, after deducting its debt, indicate an equity, at book value, for these properties of close to $1,100,000,000.

The above bonds are offered, subject to issue as planned, for subscription at 96½% and interest, to yield approximately 6⅞%

Discount will be allowed at the rate of 6½% per annum on the principal sum of the Bonds from the date of payment to July 1, 1921, from which latter date interest will accrue on the Bonds.

Subscription books will be opened at the office of J. P. Morgan & Co., at 10 o'clock A. M., Thursday, April 28, 1921. The right is reserved to reject any and all applications, and also in any case, to award a smaller amount than applied for. The amount due on allotments will be payable at office of J. P. Morgan & Co. in New York funds on or about May 16, 1921.

Northern Pacific-Great Northern, C. B. & Q. Collateral 4% Joint Bonds, due July 1, 1921, with final coupon attached, will be accepted in payment at 100% and accrued interest to date of payment on allotments.

Temporary Bonds, exchangeable for definitive Bonds when prepared and received, will be delivered upon payment.

COLUMBIA SUGAR ANNUAL REPORT

The annual report of the Columbia Sugar Company was sent out this week. Below is presented a comparative balance sheet. The report of the executive committee dated April 15, 1921, is in part as follows:

"The conditions prevailing during the fiscal year closing March 31, 1921, make it a difficult period upon which to report to you. Opposition to the best contract, as conducted by the farmers' organization, delayed somewhat the writing of contracts for the growing of beets; but the final results were that 100 per cent were delivered to us more beets than in any other year of our history. The season was a fair growing one and when harvesting started the beets had a high sugar content. Warm weather, extending through the entire manufacturing season, caused an abnormal deterioration in the beets and a corresponding loss in sugar. High prices of supplies extended past the time beyond which we dared not delay purchasing, and labor was at its peak during the campaign.

"The net seahoard quotation for beet sugar on October 1, 1920, was 12.642 cents per pound. We had no sugar to offer until after the middle of the month, when the price had declined to 10.632 cents. From then on the decline was steady up to February 13, when the price reached 6.615 cents. Since then there has been some recovery and the price is now 7.44 cents.

"There has been very little demand for sugar since early last fall. When our plants closed we had sold only 16 per cent of our entire production, and to date 43 per cent. This necessitated borrowing more extensively than we had ever done to finance a campaign. The outlook for the fiscal year just starting is promising. We have sufficient acreage written to guarantee a full supply of beets at each plant, provided the growing season is favorable. Beets, supplies of all kinds and labor undoubtedly will be secured upon a more reasonable basis than they were last year.

"Combined operations of our three plants during the last season are as follows: Beets purchased, 243,046 tons; sugar produced, 59,826,599 pounds; dried pulp produced, 11,871 tons; molasses produced, 3,458 tons.

TREASURY OVERSUBSCRIPTION

Subscriptions for treasury certificates of indebtedness of the series H-1921, dated April 15, 1921, and maturing October 15, 1921, aggregated $329,036,000 and the total of subscriptions allotted was $190,511,500. Subscriptions of the Chicago Federal Reserve district, including lower Michigan, were $30,421,000 and the allotment to the district was $22,932,000.

National Association of Cost Accountants

The preliminary program for the annual convention of the National Association of Cost Accountants, which is to be held in Cleveland, September 14, 15 and 16 next, has just been issued. It provides for three days of conferences on practical cost questions, including "Interest As An Element of Cost," "Cost Systems As a Means of Preventing Waste," "Uniform Methods and Standardization Costs," "Executive Use of a Cost System" and a number of similar topics. It is expected that upwards of a thousand cost men will take part in these conferences.

The National Association of Cost Accountants has just issued as Volume 11, No. 10, of its official publications, "A Bibliography of Cost Books." This probably contains the most complete list of cost books which has been published in this country. It is limited to books, it being the intention to cover pamphlets and other material in a supplementary bibliography to be issued later.

The bibliography is divided into five sections, one containing books devoted to the general field of costs; one to books on accounting and auditing, which contain sections dealing with costs; one to books on industrial engineering, with sections on costs; one to books on costs for particular industries, this section being divided into the leading industries; and one dealing with special phases of cost accounting, such as overhead, depreciation and the like. In all, about 350 titles are listed.

Copies of the book may be had on application to the Detroit Chapter of the National Association of Cost Accountants, 924 Book building. The price is 75 cents a copy to non-members of the association.

The national headquarters of the National Association of Cost Accountants have been moved from the Woolworth building to the twenty-first floor of the Bush Terminal building, 130 West Forty-second street, New York.

LANSING FOUNDRY STOCK SALE

Lyman Covell, of G. M. Murchey & Company, Lansing, has resigned to become director of stock sales of the Foundry Equipment Company. This company has placed on the market $100,000 of eight per cent preferred at $10 a share. Purchasers of the preferred are given the option of buying an equal amount of common stock at the same price. The stock is being sold through the Murchey company. The last annual report of the foundry company shows total assets of $462,557.33, there having been a steady increase since the concern was founded in Lansing in 1913.

SIMPSON ON TAX COMMISSION

Governor Groesbeck has appointed Nathan F. Simpson, Hartford, former warden of Jackson prison, a member of the state tax commission to succeed Orlando F. Barnes, whose term expired in January.

DETROIT EDISON REVENUES

Detroit Edison Company's gross revenues for March were $2,055,387, an increase of 10.1 per cent, compared with March, 1920. Total operating and non-operating expenses were $1,463,366, an increase of 3.6 per cent. Balance after interest was $317,569, an increase of 13.9 per cent. For the three months ended March 31, total revenues were $6,230,689 and net was $1,772,695, being an increase in the former of 12.4 per cent and an increase in the latter of 23.6 per cent. Balance after interest was $975,417, an increase of 5.9 per cent.

BRUNSWICK-BALKE-COLLENDER

The balance sheet of the Brunswick-Balke-Collender Company, Muskegon, for the year 1920 shows a deficit of $331,715, as compared with a surplus as of $2,258,601 for 1919; $734,196 for 1918 and $692,688 for 1917. The net profit and loss surplus carried over was $309,326, as against $8,015,560 in 1919; $5,756,969 in 1918 and $5,022,781 in 1917. Assets of the company on December 31, 1920, were $44,939,375, as compared with $29,132,030 at the end of 1919.

The assets are listed as follows: Real estate, etc., $17,152,895, as against $7,674,931 in 1919; sundry investments $204,236, as compared with $220,775; inventories, $17,662,331, as against $12,098,415; accounts and bills receivable, $9,163,039, as against $7,228,601; cash, $1,068,341, as compared with $863,303; deferred charges, $1,028,131, compared with none; no United States or Canadian securities, compared with $1,452,128 in 1919.

The liabilities are made up as follows: Preferred stock, $4,818,500, as compared with $4,833,506 in 1919; A stock, $9,000,000, and B stock, $13,500,000, as compared with $6,000,000 common stock in 1919; gold notes, $3,200,000, as compared with $4,000,000 in 1919; note payment due, $400,000, compared with none; bills payable, $9,386,000, as compared with $2,179,189 in 1919; accounts payable, $3,955,895, as against $2,839,185; reserves for taxes, $70,000, compared with $1,000,000; sundry reserves, $98,330, as compared with $60,000; dividends payable, $84,323, as compared with $84,586; surplus, $309,326, as compared with $8,015,560.

During the year, says the report, the company added $2,484,486 to its surplus through a revaluation of its properties. This sum represents $0 per cent of the increased valuation shown. During the year a 150 per cent stock dividend, amounting to $13,500,000, par value, was paid on the new Class A stock in Class B stock.

CORUNNA BRICK RECEIVERSHIP

On petition of a majority of the stockholders of the Corunna Brick Company, Corunna, Judge Ira W. Jayne, of Wayne circuit court, has appointed the Security Trust Company, Detroit, receiver of the concern. The company, which manufactures face brick, owns 100 acres of land, from which it obtains its shale and coal. Lack of capital, together with dissatisfaction among the stockholders, is said to be the reason for the application for dissolution. The receiver will continue operations on a limited scale pending decision on the dissolution of the company and sale of its property, hearing on which has been set for May 19.

COMMONWEALTH POWER EARNINGS

For the twelve months ended March 31 the Commonwealth Power, Railway & Light Company reports gross earnings of $31,756,269, an increase of $4,430,495 over the total for the preceding twelve months. After providing for charges and taxes, the net was $822,879, a decrease of $742,266.

The company has passed the preferred quarterly dividend of 1½ per cent, payable in scrip, to avoid an increase in indebtedness through the issuance of additional scrip.

WOLVERINE INSURANCE STOCK ISSUE

The second issue of the Wolverine Insurance Company capital stock has been passed by the Michigan Securities Commission and is being offered for sale. The first issue of $100,000 was absorbed some time ago. The company, located in Lansing, handles automobile insurance and selected business risks, and was organized as a running mate of the Michigan Employers' Casualty Company. This second issue has been made necessary on account of large re-insurance business offered by the larger eastern insurance agencies.

Prompt Payment

BY providing him with an income while disabled by accident, the Compensation Act is designed to make the injured workingman self-supporting.

WHEN payments of compensation are long delayed, this purpose is defeated.

IT is no more than good business and common justice that the injured workingman should receive his compensation as quickly as legal formalities will permit.

SINCE the organization of the Company in 1913 it has been the consistent purpose of the Michigan Mutual to pay all compensation claims as promptly as possible.

ITS success in this is proven by the fact that our Company holds the State record for promptness in the payment of compensation.

A CORRECTION

In our issue of April 2 it was stated that the mason contractors of Detroit and their employes had reached an agreement whereby the wage scale was to be $1.12½ an hour, effective May 1. This was incorrect. The actual situation is that the brick layers and master masons have agreed upon a reduction from $1.25 to $1.12½ until May 1, after which date the rate will be $1 an hour.

DETROIT TRUST SAFE DEPOSIT COMPANY

Articles of incorporation of the Detroit Trust Safe Deposit Company, with a capital of $100,000, have been filed. The organizers are Fred T. Murphy, Sidney T. Miller, A. H. Buhl, Charles A. Dean and Ralph Stone, each of whom has 200 shares of stock of par value of $100. This company has been organized under the safety and collateral deposit company act to handle the new safe deposit department of the Detroit Trust Company. Under this act the powers of the company are somewhat enlarged. The new department will be thrown open to the public about May 1. There are 3,300 individual boxes. Entrance is from the lobby of the trust company.

LINDERMAN STEEL COMPANY

THE DETROIT SAVINGS BANK

Preparing for Death and Taxes

(Continued from Page 6)

On all amounts in excess of $10,050,000 the tax is 25 per cent. The law specifies that a certain amount of life insurance shall be exempt from the inheritance taxes.

The majority of the states having an inheritance tax law impose a tax on transfers of property, wherever located, belonging to a resident deceased. Because this is not an invariable rule, liability for inheritance taxes presents a difficult problem. For instance, if A dies in state X leaving shares of stock in a company located in state Y, and this company does business in state Z, it can be seen that any transfer of these shares will be taxed in all three states, and if the certificates are on deposit in a fourth state that commonwealth also may claim a tax. The tax is not a levy upon property but upon the right of succession to property. Where stocks are held by an estate, or where bonded or other debts are owed to it, the laws of the state where the corporation is organized, of the states where it controls property, of the states where the debtors live, and of the states where the securities or evidences of debt are actually held, must be examined. The questions arising here are governed largely by the growing need for revenue—that is, they are governed by political expediency.

Four Classes of Beneficiaries

The Michigan law divides beneficiaries into four classes: A—Grandparents, father, mother, husband, wife, child, brother, sister, widow of son, husband of daughter, adopted or mutually acknowledged child, for whom all real property is exempt entirely and personal property is exempt up to $5,000 for the wife and $2,000 for all others. After exemptions the rate on the first $50,000 of valuation is one per cent; $50,000 to $500,000, two per cent; over $500,000, three per cent.

B—Non-resident allen collaterals and strangers to the blood and corporations incorporated without the United States, $100 exemption; twenty-five per cent on all other property.

C—All other persons and corporations except Class D, $100 exemption; first $50,000, five per cent; $50,000 to $500,000, ten per cent; over $500,000, fifteen per cent.

D—Gifts to religious, charitable and similar purposes, to Michigan corporations, entirely exempt.

The tendency of the average man is not to give serious thought to the prospect of shuffling off this mortal coil until on the brink of the grave, but when a man does begin to think about the end he is inclined to seek ways and means of avoiding as much of the inheritance and estate taxes as possible. This often is attempted by property transfers or joint ownership. One case cited is that of a man who had property valued at $1,200,000. He drew an agreement with his son, which showed that one-half of his estate constituted a debt owed to his son. When the father died the son had some difficulty showing the tax collectors what the debt was for, but finally it was put down as remuneration for services rendered. The inheritance tax was greatly reduced but the income tax got the son. The inheritance tax on $500,000 was about $23,000 but the income and sur taxes amounted to $267,638, a total of over $290,000. The inheritance taxes on the total estate would have amounted to approximately $110,000.

The transfer of property before death is looked upon with suspicion by the revenue departments of the Government and the states. There have been reciprocal transfers—a father transfers his property to his son; the son transfers the property back to his father. The transfers are held by the trust company or attorney until the death of one or the other of the parties to the agreement. Suspicion is directed to these transfers in contemplation of death and no effort is spared to collect taxes on them. Also there is the danger of a breach of faith where property is so handled.

Where property is held jointly, if one half was contributed by the decedent and the other half by the survivor, the decedent's estate pays the tax on one half of the property. On the other hand, if the survivor contributed all of the property and merely agreed to joint ownership, no tax can be collected on any of the property until the survivor dies. If the decedent contributed all of the property, then the decedent's estate pays the tax and there is no claim against the survivor.

Life Insurance as a Solution

The growing importance of protecting estates from disorganization, and in some cases, wholly annecessary and unreasonable depreciation in the payment of inheritance taxes has brought into favor the purchase of life insurance in large sums, not primarily to indemnify life but to indemnify the estate. All the rules and regulations, rates and premiums governing life insurance apply to policies taken out to meet inheritance taxes and other costs levied upon estates. The sale of life insurance for this purpose adds another department to underwriting. The company and its agents specializing in inheritance tax insurance must be well versed in inheritance tax laws as well as the numerous subterfuges attempted to avoid these taxes.

Personal life insurance up to $40,000 is exempt from taxation. Estates up to $50,000 are exempt from federal inheritance taxes, and certain exemptions are allowed in various states. Omitting the states, the federal exemption and life insurance exemption provide a total exemption of $90,000. Life insurance is paid in cash and is available for taxes, leaving the estate intact.

A man in the prime of life, with every prospect of living at least his allotted three score or more years, cannot determine what his estate will be at death. It may be multiplied many times over, but the flexibility of insurance provides against this uncertainty. It can be increased as the estate grows, with the result that at the time of death the insurance can be made sufficient to cover all expenses and taxes, maintain the integrity of the estate and protect business from disorganization and the heirs from exorbitant fees and undue worry.

There is an increasing tendency on the part of men with considerable property to be passed on to their families, business associates or relatives to place the final settlement of their estates in the hands of a trust company. This is particularly advisable in these days of supertaxation, for the reason that trust companies have the facilities and the experts to administer estates with the least loss to the beneficiaries. It is equally advisable, when considering insurance for business purposes, to seek the services of competent life insurance counsel. There need be no obligation—in fact, there should not be an obligation where such counsel is sought. With the benefit of life insurance counsel and trust company advice and service, the man with property to pass on can proceed with the business of living long, happily and prosperously without worrying about the fate of his life's earnings after he has ceased to watch over them.

FLOORING COMPANY RESUMES

The West Michigan Flooring Company, Manistee, has resumed operations with a force of about fifty men.

B. OF C. CRUISE JUNE 9

It is announced that the 1921 cruise of the Detroit Board of Commerce will start June 9 and end the following Monday. The steamer Noronic has been charted and the point will be Georgian Bay. The cruise committee is composed of W. A. C. Miller, of the W. A. C. Miller Lumber Company, chairman; C. Hayward Murphy, of Simon J. Murphy Company; Arthur W. Winter, of Evans-Winter-Hebb, Inc.; Jacob Nathan, of Detroit Stock Exchange; William F. Holliday, of Burroughs Adding Machine Company; Robert H. Clancy, United States customs appraiser; Charles A. Hughes, Detroit Athletic Club; Sidney R. Small, of Harris, Small & Lawson; Harry Andrews, of Boyer, Campbell & Company; James Ballard, of the Solvay Process Company; Edward R. Grace, of the Michigan Manufacturer & Financial Record, and W. A. Mara, of the Board of Commerce.

SAFETY CAMPAIGN STARTS MAY 23

In a proclamation announcing another safety campaign for the week of May 23, Mayor Couzens, Detroit, calls attention to the fact that an a resmit of the work of the Citizens' Public Safety Committee last year the insurance companies cut the accident liability rates more than $1,000,000 for Detroit automobile owners this year. In the streets of the city last year 228 persons were killed, of whom 85 were children.

INCREASING LOWELL OUTPUT

Ten additional machines have been installed in the Lowell branch plant of the Michigan Garment Company. The company is reported to have received several important foreign orders.

Drilling

(*Continued from Page* 11)

The main types of drilling machines have been discussed. In each of these types there are many variants. This is particularly true of the smaller machines. There are several manufacturers who will make the machines to fit the purchaser's individual needs.

The first thing in looking over the proposition is to make sure just what your drilling requirements are. It sometimes happens that you really do not need a machine for the operation on which you are crowded. It may be that some other operation apparently well cared for could be performed on some other machine to much better advantage and the purchase of a small machine to do this would release enough capacity to handle the excess drilling requirements.

There is a tendency to run true to form in buying machine tools as in buying clothes. You become accustomed to one type of machine and your first thought is how to do that particular job on that type of machine. This is particularly wrong at the present time, for there are so many excellent machines of so many varieties that it is necessary to study the whole problem carefully to get the best solution.

Do not rely entirely on what the salesman tells you about his machine, because not all of those new models put out have proved to be just what was expected. Find out who is using that particular machine and go take a look at it and see how it is standing up.

A trip through the factories of this country shows many a paradox. In certain departments the factory will be well up to the times but in other departments there will be much out-of-date machinery which could have been delivered to the scrap heap years ago at a considerable net saving. This is particularly true of drilling machines.

Have you any which would appear to advantage in a Museum of Ancient Practices?

Mr. Automotive Parts Manufacturer:--

Did You Get That Order You Figured On?

Maybe this is your predicament.

The other day a local parts manufacturer called on the Purchasing Agent of ——— Motor Company.
He wanted to quote on wrist pins, oil pump plungers, cam rollers and pins, etc.

Says the P. A.: "Have you got a Detroit Centerless Grinder?"

"No. Why?" said the Parts Manager.

Here is what the Purchasing Agent said:
"You can't compete with others unless you grind by the Centerless Method, and you better buy one of the machines."

AND WHY NOT?

Piston Pins, 1 1-16" dia. x 3½ long—125 per hr.
Piston Pins, ¾" dia. x 2¾ long—200 per hr.

Merrick Resigns, With Hot Letter to Groesbeck

Frank W. Merrick, who for six years has been Michigan state banking commissioner, sent his resignation to Governor Groesbeck on April 26, together with a pointed letter in which he says he does not care to continue to serve in case the bill now in the legislature empowering the governor to remove the banking commissioner at will becomes a law. He makes it plain that he believes the governor's purpose in supporting the bill was to enable him to remove him (Merrick) and that, by resigning, he will "satisfy" the governor's "personal wishes" and not make it necessary to change the banking law—a change which he believes would be a mistake. The body of the letter follows:

"There has been introduced in the present legislature House Bill No. 507, which, if it becomes operative, makes a change in the tenure of office of the banking commissioner and provides for a day-to-day appointment as the bill is now understood.

"The tenure of office of the banking commissioner was established in the original Michigan banking statute and has been effective for the last thirty years. During all of this period the Michigan state banks have enjoyed the confidence of the public and have made a growth, particularly during the last six years, that is somewhat phenomenal. It is a generally recognized fact that the banking business should be regulated by statute and supervised in order to bring about a satisfactory condition in this line of business. In order to supervise banks in a satisfactory way the supervising official should be free to exercise his best judgment and should not be controlled by political affiliations or connections.

"I have had the honor of serving as commissioner of banking for the last six years, during which time the institutions under the supervision of this department have grown from $400,000,000 to over $1,000,000,000 in resources, and there have been no failures of Michigan state banking institutions. While I consider public service a duty of all citizens who are in a position to accept the same, as above stated, I have served in this capacity for six years, and feel that I have fulfilled my duty in this respect.

"I have no desire to continue in office under existing conditions, particularly as I am advised that the legislation referred to has your support and is probably the outcome of personal differences which have arisen between you and myself. If this be the case, I do not wish to assume the responsibility of having the tenure of office of the banking commissioner changed in this manner, as I am certain that it will seriously impair the standing of the Michigan banking department, both in the state and in the nation, where it stands second to none at this date.

"In order that there may be no question in regard to my position in this connection I herewith tender you my resignation as commissioner of the banking department, to take effect immediately. In tendering this resignation I am doing so in the hope that you may now feel that your personal wishes have been satisfied, and will conclude that the best interests of the state will be served by allowing the present banking law to stand."

Goodyear Control Passes From F. A. Seiberling

Reorganization of the Goodyear Tire & Rubber Company, Akron, was effected a few days ago. During the next twenty years the banking interests which made the refinancing possible will practically control the destinies of the big concern. F. A. Seiberling, president and general manager, having resigned. The bankers directly interested are Dillon, Read & Company; Goldman, Sachs & Company; the Guaranty Company of New York; Lee, Higginson & Company; Blair & Company and a number of other associates.

The bankers in connection with the refinancing plan offered for public subscription an issue of $30,000,000 of first mortgage twenty-year, eight per cent sinking fund gold bonds, which issue, it is reported has been entirely subscribed. During the life of this bond issue control of the Goodyear company will be vested in management stock, which will name a majority of the board of directors and will be held by Clarence Dillon, Read & Company; John Sherwin, of the Union Trust Company, Cleveland, and Owen Young, of the General Electric Company.

The proceeds of the new issue of first mortgage bonds, together with the proceeds of the $27,500,000 ten-year, eight per cent debentures, which have been sold and will be offered to stockholders, will be utilized in payment of the company's current obligations and in increasing working capital. The mortgage provides that the company at all times should maintain net current assets equal to 125 per cent of the entire amount of bonds outstanding.

Under the reorganization the old preferred stock will remain unchanged. There is authorized $40,000,000 of new preferred seven per cent stock, of which $30,000,000 has been taken by merchandise creditors. There will be also 900,000 shares of no par value common, which will be exchanged for old common stock of $100 par value.

In all, 70,000 stockholders and merchandise creditors assented to the plan for reorganization as presented by the bankers as follows: Common stockholders, holding about 560,000 stock; preferred stockholders, holding about $65,000,000, and merchandise creditors, holding about $85,000,000 of claims.

The general balance sheet of the company on February 28, 1920, after giving effect to the present financial readjustments, shows net property account of $54,252,059; net tangible assets, less all reserves, of $135,344,153, and net current assets of $63,139,808. Net current liabilities amount to about $9,000,000, representing contracts for construction work. All bank loans have been paid, and through issuance of the securities mentioned the company will have about $11,000,000 in cash. In all there was provided nearly $43,000,000 for adjustment of inventories and raw materials.

In connection with their purchase of $30,000,000 first mortgage twenty-year, eight per cent sinking fund gold bonds, the bankers of company notifies the bankers that net income available for interest, taxes and inventory adjustments for the fiscal year ended October 31, 1920, was $10,384,908. However, as of October 31, 1920, inventories were written down to market value by a deduction from net income for the year of $9,870,000. Furthermore, in the balance sheet as of February 28, 1921, adjusted to show the effects of the present financing, an additional $8,850,000 has been written off, and provision made, amounting to $24,000,000, for possible loss on raw materials under contract but not yet received.

The balance sheet referred to as of February 28, 1921, gives effect to the losses from operation during the period from October 31, 1920, to February 28, 1921, together with the adjustments of inventories and provisions against possible loss on raw materials under contract. This balance sheet shows the following current asset items: Materials and supplies, (less reserves) $21,289,776; work in process, $1,298,888, finished products, $19,622,250; customers' notes, trade acceptances and accounts receivable (less reserves) $19,332,996; cash, $11,176,095; total, $72,711,006. Current liabilities mainly payable only as materials for which incurred are acquired by the company, amount to $9,571,198. In addition, there are reserves of $4,972,717 for contingencies and possible federal taxes, and $8,750,000 for additional possible loss on rubber and fabric under commitments but not delivered, in excess of amount of $15,250,000 provided for by issue of prior preference stock.

Goodyear capitalization after the present financing will consist of: First mortgage bonds, $30,000,000; debenture bonds, $27,500,000; eight per cent preferred preference stock, authorized $40,000,000; to be presently issued exclusive of stock held as collateral only) reserved for creditors and contractors not yet assenting to plan, etc., $30,342,000; preferred, issued $65,532,600 (less $450,000 in treasury); management stock, $10,000; common stock (no par) $1,000,000; total stock, $96,434,600.

Statistician figure that the income return on the new $30,000,000 Goodyear Tire & Rubber eight per cent bond issue will range from 50 per cent down to 8.51 per cent, depending upon when the bond is called for payment at the callable price of 120 and interest, says the Wall Street Journal.

Under the bond indenture the company is required to provide a sinking fund to retire $750,000 of the bonds each six months beginning November 1, 1921, by offering for bid at 120 and interest. Bonds called for instance on November 1, 1921, will receive $124 for each $100 bond with interest and other cash income of $25 for the half year period, which is at a rate annually of more than 50 per cent. Return on the last $750,000 will be 8.51 per cent.

Vice-President M. Edelman, who will be general manager, is confident that the company's business will gradually return to normal. The plant has a capacity of better than 35,000 tires a day and at present is operating at about 50 per cent of normal, according to recent reports.

Flint Making Rapid Progress to Normalcy

Flint ranks second among the cities of the United States reporting an increase in employment during March, according to the Industrial Survey Bulletin issued by the Department of Labor. The report shows Flint's increase as 14.4, a gain of 12 per cent.

Indications point to a gradual resumption of business and the announcement by the Buick Motor Company that the St. Louis assembling plant is being moved to Flint should serve as an added stimulus to a reviving market.

Another hopeful sign is the increase of the bank clearings during March as compared with February. The total gain for the month being $823,760.04. The market director reports that the farmers are gradually comink into the market again and, with the crops looking in splendid condition, hope for an increased building program in the country districts is revived. The decline in the price of lumber averaging 40 per cent in the last few months is responsible for this revival of interest.

WESTINGHOUSE REPAIR STATION

The Westinghouse Electric & Manufacturing Company has opened a large, well-equipped repair shop for the repairing of all kinds of electrical machinery, at 1535 Sixth street, Detroit. The personnel is under the supervision of engineers who received their training at the factory. The Detroit sales office of the Westinghouse company is at 1205 Dime Bank building.

Engineering Research Work Is Facilitated

The third meeting of the Executive Committee of the Department of Engineering Research of the University of Michigan was held at the Detroit Club, Friday, April 22. There were present M. J. Murphy, chairman, presiding; President M. L. Burton; ex-Governor Chase S. Osborn; Henry M. Leland; A. B. Williams; H. H. Smith; Frank Fletcher; M. W. Neal; Walter Russel; E. B. Perry; Mr. English; John L. Lovett; Profs. A. H. White; H. C. Anderson; H. W. King; J. C. Parker; Emil Lorch; H. C. Sadler and Prof. A. E. White, director of the Department of Engineering Research.

President Burton made some brief remarks. He expressed his gratitude to the manufacturers for the splendid manner in which they have stood in back of the university requests. Ex-Governor Osborn stated that he believed that the university had taken a great forward step in the establishment of a Department of Engineering Research and that he believed this department would grow to he one of the largest and most useful in the university. He considered that it was essential to the welfare of the state and to the university. He pointed out that Michigan must do more than the average state in research if it is to maintain its position, since it becomes in certain with national and international competition to a greater extent through the exportation of automobiles.

Prof. A. E. White, as director of the department, made a report to the committee recommending that the members of the Advisory Board be divided into sub-committees so that the work of the department may be more adequately performed. On the completion of his report the following resolutions relative to the same were submitted by E. B. Perry, seconded by Mr. Williams, and unanimously passed by the committee:

WHEREAS, We have heard this report of the Director of the Department of Engineering Research; and

WHEREAS, it is recommended that the Advisory Board be divided into committees for each type of industry; and

WHEREAS, it is recommended that sub-committees be appointed in the case of those industries with diversified interests; and

WHEREAS, It is recommended that these appointments be made by the Chairman of the Executive Committee of the Advisory Board; and

WHEREAS, Since there may be men who should be on these main or sub-committees who are not now members of the Advisory Board, it is recommended that the Chairman of the Advisory Board be authorized to recommend such men to the president of the university for appointment on the Advisory Board; and

WHEREAS, Since it may be desirable to have the assistance of men who devote the major share of their time to industry on the technical character, it is recommended that the chairman or members of any given committee be empowered to appoint such person or persons to technical or advisory committees as desired, it being understood that these appointees may or may not be members of the Advisory Board.

It is resolved that the report be accepted and the recommendations approved and adopted, so proper steps may be started whereby the university and the industries and technical interests of the state may work toward that end for which the Department of Engineering Research was established.

CAMPBELL MENTIONED FOR I. C. C.

A report from Washington says that President Harding is looking with favor upon the appointment of Milo D. Campbell, Coldwater, as a member of the Interstate Commerce Commission. It is said the President wishes to make us one member of the Commission a man identified with the agricultural interests.

HOWELL MOTORS ELECTS DIRECTORS

The Howell Electric Motors Company, Howell, has added as directors M. R. Carrier, president of the Federal Drop Forge Company, Lansing, and C. E. Bement, vice-president and general manager of the Novo Engine Company, Lansing.

Machinery and Power Equipment

Our Aim is to Render Service

COMPLETE EQUIPMENT

FOR

Tool Room, Production Shops, Sheet Metal Shops, Pattern Shops, Body Plants, Automobile Plants, Wood - working Plants, Repair Shops, Heat Treating Iron and Metal Foundries.

Among the 1500 or more new and used Machine Tools of all descriptions and quality we have on hand for immediate shipment are the following standard makes of drilling machines:

2—Dumora Motor Driven Bench Drills, 110 volts, new
3—No. 1 Burke Bench Drills, with chucks, new
2—Avey High Speed B. B. Drills—bench type, used
3—No. 28—½" cap Canedy-Otto Bench Drills, new
3—14" Excelsior Sensitive Floor Type Drills, new
2—16"—¾" cap. Hoosier Floor Type Drills, new
1—20" Barnes All Geared Single Pulley Drive Prod. Drill, used
3—21" Milwaukee Upright Drills, wheel and lever feed, new
5—20" Champion ditto, with back gear, power fd. a. s. No. 4 M.T., new
2—24" Milwaukee Sliding Hd. B. G. P. F. A. S. with T. A. built in, new
1—25" Buffalo Stat. Hd. B. G. P. F. A. S. No. 4 M. T., new
3—No. 2 M. Baker Hvy. Duty Prod. Drills, used
4—No. 310 Baker Hvy. Duty Prod. Drills, used
1—20" spindle Rockford Gang Drill, b.g. p.f. a.s. No. 3 M. T., used
1—4 spindle Cleveland Rail Drill, adj. hds., No. 4 M. T., used
1—26" Barnes Sliding Hd. Upright Drill, used
1—2½ ft. Fosdick Radial Drill, complete, used
and many more too numerous to detail here.

We sell and recommend for your consideration the following well known makes:

Hoosier complete line of drilling machines, including the famous heavy duty single pulley drive.
Langalier line of High Speed Ball Bearing Drilling Machines.
Milwaukee complete line of Upright Drilling Machines.
Canedy-Otto line of Wall and Floor Radial Drills.
Western complete line of highest quality Radial Drills, all types and sizes.

We have a copy of our latest stock-list ready for you.
We always are interested in buying, selling, trading or exchanging only high grade equipment.
We maintain our own repair-shop on our premises.
Our warehouse contains 100,000 square feet of floor space.

Our motto is—We must satisfy you absolutely.

What of Business Today Had There Been No War?

(*Continued from Page* 6)

of labor statistics and other treasury information, and so far as history is a guide, may be given careful consideration. The high and low points are as follows:

War of 1812 Period		
1810	173	19 years steady fall, high to low level.
1814	247	
1843	84	
Civil War Period		
1860	105	4 years to high level, 15 steady fall to low.
1864	237	
1879	99	
Recent Period		
1896	69	7 years to high level, 7 years to low level.
1913	101	
1917	176	
1920	244	
April, '21	175	

It is very probable that an absence of banking and currency troubles may have a different effect on the time it will take to reach a permanent lower level but there is every reason to believe, in the light of past performance, that the bottom has not yet been touched.

The reaction, however, should not be so violent as heretofore, for under the old banking system we had no watch dogs. Each community went along serenely until something happened elsewhere and then all rushed for cover, each concealing the available money within reach, whereas we now have almost an automatic machine which increases or decreases currency and transfers money or credit from that part of the country which has a surplus to that which needs it, and there is fortunately a board of watchmen down in Washington that keeps an eye on the speedometer.

Getting back to 1913 and 1914, however, we have observed the same trend of many factors the last year that was operating against prosperity then. Stocks and bonds were gradually working down to lower levels, foreign trade was falling off and the ratio of hard money to paper money and credits was growing steadily smaller. There are many, no doubt, who will recall the nation-wide efforts of the National City Bank and one or two other New York banks to wake our people up to the necessity of increasing foreign trade. Young men by the score were going into the foreign banking service. So that from many angles the business drift of the country was much the same during two years before the war as it has been the last ten months. And right here is the point I desire to emphasize: That the war supplied the very foreign trade the new York banks were appealing for, and it supplied that trade in such volume as we never dreamed. But of course there has to be an end to such an unnatural forcing of trade out of its normal channels, and instead of ending with the war as most of us expected, it kept up about eighteen months thereafter, until a great many merchants and manufactrners thought the swollen stream of orders was going to continue permanently. Some thought we had simply reached a higher price level in all things and would so continue for some years.

But as we know now, most of the money for this carnival of trade came out of our own treasury and the treasury borrowed it from the Federal Reserve System and the latter got swelled up out of normal shape issuing currency and credit like a poisoned pup.

That swelling has gone down. Everywhere things begin to look more natural; business, banks, bank rolls and not a few heads show now the healing effects of the deflation process. But instead of gont the malady threatening now is idleness and hunger, and to prevent either getting a grip on our people we must immediately take up the fight for foreign markets for our surplus that was dropped when the war began.

The world outside of the United States wants our $8,000,000,000 surplus badly but there is a limit to the prices they are willing to pay. We must look back on the profits of the last six years as something that comes once in a lifetime and begin finding out how we can compete with the German and the Briton who, notwithstanding much greater increases in the cost of living in those countries in terms of their own currency, are by reason of lower relative costs of production seriously threatening the foreign business of ours in countries like Mexico, where we have held 80 per cent, but are making it increasingly difficult to get a foothold elsewhere.

War gave us a temporary advantage which taxes and declining inventories at the present rate of absorption will soon wipe out. War paid off the three billions we owed Europe before 1914 and it created debts of about $15,000,000,000 in our favor. But war spoiled a good cash market in Europe; it left us with a surplus of goods and facilities several times larger than those of 1914; and it left us on a cost level based on gold (not exchange rates for currency or drafts) twelve times higher than that of Germany, four times higher than France and two times higher than Britain.

Must we go down to their level or will they come up to ours? I look for neither; but we will have to go down a lot more, and as they get on their feet they will come up. But if we could only see now the importance of letting them have our surplus at almost any price, the equilibrium which must come eventually will be restored much quicker and with much less shock to our own profit and loss account.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

U. of D. Takes Leadership In Making City U. S. Aero Center

Establishes Five-Year Course in Flying Science And Brings 1921 Exposition to Michigan Metropolis

By F. W. HERSEY

WHEN the United States was plunged into the most scientific and destructive war in the world's history the supreme importance of aircraft as the "eyes" of the artillery and the "cavalry of the air" had been established. In character and numbers Germany had a marked advantage over the Allies. Her air scouts flew faster, her combat planes fought more successfully and her "air-pointers" for the artillery were making her guns more deadly as the war progressed.

The answer? Just this: While France, England and the United States were "playing" with aviation, Germany had been developing aeronautics with one view in mind—war. War calls for efficiency, endurance, quantity production, precision—the best of them all. In aeronautica, as in every other branch of the vast war machine, the equipment had to be the best and the knowledge the most complete—and Germany had all this to the very last degree of her capacity. That was why she was slowly but surely winning when the United States stepped in and turned the tide.

So, when the United States decided to step in, her war chiefs knew all about the importance of aircraft, and all about the airplanes, balloons, dirigibles and blimps used by the contending armies and navies up to that time. More than this, it was definitely known that, if this war was to be won before the heavy part of the civilized world gassed itself to death, better aircraft, driven by better engines, would have to be found. Germany must be beaten in the air, was the slogan.

When the War College turned its searching gaze over the country in its quest of engine brains and manufacturing facilities, where did this gaze rest? Upon Detroit of course. Detroit was the automotive center of the United States. Its citizens made engines, talked engines, rode behind them—knew all about them. Therefore, Detroit's automotive engineers were drafted and commissioned to produce an engine that would beat anything the common enemy could put into the air. The Liberty motor was the result. Had the war lasted a few months longer the air over Europe would have been as clear of enemy aircraft as a billiard ball is of hair.

Well, where are the Liberty engines today? Where are the Liberty-engined flying machines? Where is Detroit on the aeronautical map of the world?

S' e just ain't, that's all. She spoke her little piece, made her little bow and then went way back and sat down, and she has been sitting ever since, apparently quite unconscious of her potentialities as the aeronautical center of the United States.

During her brief appearance upon the war stage she was press-agented from Dan to Bersheba. Friend Caproni, over in Italy, where they jump into an airplane and hop over the Alps before breakfast, was so successfully sold on Detroit-made Liberty engines that he just had to have them for his super-passenger-carrying ships. He is putting a flock of these engines into his new 100-passenger machine which soon will be making new records for sunny Italy. I suppose a little research work would disclose the fact that Germany and Japan have some of these engines and are trying to make a ship that will, when driven by them, reduce the rest of the world to pulp when the next war is announced. That is the way usually with American inventions.

Two major factors made Detroit's success with the Liberty engine possible—experience with gasoline motors and the facilities to turn them out like animal crackers. The experience produced engineering brains and the demand for automobiles developed the productive facilities and power.

As was said earlier, the manufacture of engines and parts for aircraft was one of Detroit's most important activities during the war period, and, if advertising is essential to the manufacture and distribution of product, Detroit has had the advantage of 100 per cent advanced advertising on a product she does not make and has not for sale. Admitting that the demand for aerial limousines and flying box cars is not so feverish as to encourage profiteering just now, if there is anything in this vision stuff, it is about time Detroit prepared for the commerce and industry horn of the air that is surely coming.

The Vision of the U. of D.

Anyway, while there is a University of Detroit and a few brave citizens with eyes that focus beyond the points of their noses there is hope. While the automotive industry is waiting impatiently for the return of normal (whatever that may mean) in this industry, and wondering at the same time what they are going to do with the excess space and machinery added during the war emergency and later during the money-burning orgy, the University of Detroit has been quietly planning a five-year course in aeronautics, confident in the belief that eventually Detroit will become an aircraft and aircraft equipment center and the demand for men trained in this science will be greater than the visible supply.

This confidence is based upon the knowledge that Detroit has the plants, the industrial genius in trousers, the natural sources of much of the material needed; is motor wise and vehicle broken; has led the world in the construction of motor cars and motor trucks, and is most advantageously located for the manufacture and operation of aircraft in commerce.

In laying out this course the University of Detroit becomes at once the first educational institution in the country to recognize aeronautics as a science of itself worthy of a special degree, and one that can be properly taught only by co-ordinating all its numerous phases into a uniform curriculum that will cover this science completely.

The uninitiated may wonder what there is in aeronautics to require five years' training. The average man who has flown an airplane in war or peace is more likely to wonder if it is possible to cram all there is to know about aerial navigation and aerial equipment into five years. Whether or not it is possible to do the subject justice in that length of time remains to be seen, but judged by present standards the University of Detroit can produce aeronautical engineers of a caliber superior to anything now known. Like medicine, law, chemistry and a multitude of other sciences, theory in aeronautics is one thing; practice is quite another.

Lieut. Thomas F. Dunn, dean of the new department of aeronautics at the University of Detroit puts it this way: "There are lots of engineers who can tell you all about aeronautics on the ground, but when they get up into the thin air their theory is like a ship without a rudder and no compass—very active but with indefinite plans as to the future." The impression that takes hold of us is that there are two ways of getting an aeronautical education. One is to go up in the air first and gather some experience, and if spared for future investigation, return to solid earth and tackle the theory. The other way is to tackle the theory first and then try it out on the air.

So far, such institutions as the University of Michigan, the Massachusetts Institute of Technology and perhaps a few others have given some instruction in one or perhaps several branches of learning which have some bearing upon aeronautics, but none of them have gathered all the loose ends together in one knot and given the knot to the student to untie. This is what the University of Detroit is determined to do. It means the addition of special laboratories, a wind tunnel, equipment of various kinds, aircraft, a flying field, the organization of a faculty and possibly the arrangement of special textbooks which will bring together in orderly fashion the present-day knowledge of air transportation, air technology and mechanics.

Some idea of the latitude of this subject is

Digitized by Google

This map shows the transcontinental and coastal airways and the air routes in the United States and part of Canada. The arrow shows the location of Detroit between the Wilson and Chanute and Bell airways. A circle drawn around Detroit on a radius equal to the compass distance from Detroit to New York will show the wonderfully advantageous position of Detroit as an aeronautical center, commercially, industrially and educationally.

conveyed by the following subjects to be taught: Higher mathematics, communication, mapping, astronomy, physics, meteorology, weather calculation, theory of flight, balloons, aerodynamics, aerostatics, aircraft mechanics, testing drawing, administration, chemistry, electricity, engineering principles, metal working, working design and construction, topography, wireless telephony and telegraphy, safety devices, uses of instruments, some commercial law and all there is or will be on aerial navigation laws, principles of law as it is or will be applied to the air, and aerial photography.

This will suffice in a measure to show what the future aeronautical engineer will have to know. Incidentally, the University of Detroit will have the only wind tunnel, a device for studying air currents, west of New York and Washington and east of California, with the one exception of McCook field at Dayton, O., which may not be in Dayton very long.

For surveying purposes aerial photography has proved to be highly valuable. If the Government approves the Great Lakes-St. Lawrence route to the sea project the work of surveying is likely to take two years, a large number of men and considerable expense, if done by the customary land and water surveying methods. Aerial photography, it is asserted, will accomplish better results in a few days, and it is likely that the job will be done by photography. Thus the aeronautical department of the University of Detroit will have right at home its greatest laboratory for photographic instruction and practice.

Apparently the confidence in Detroit's eventual awakening to its possibilities as a manufacturing center for aeronautical equipment and as a center for the operation of aircraft in commerce is shared by the Aerial League of the World, the Aerial League of America and the Pan-American Aeronautic Federation, for these organizations have decided to hold the annual aeronautic exposition and aerial touring contest in Detroit this coming September, probably right after the Pulitzer Trophy race, September 8, 9 and 10. This exposition and touring contest has been held at Atlantic City for the last two or three years and has been successful.

The 1920 meeting brought together 180 delegates from twenty-six countries and entertained 300,000 visitors at Atlantic City. The exposition provides opportunity for displaying aircraft and aircraft equipment from every country. The twenty touring contests during the ten days' meeting showed the progress that had been made up to that time in machines for passengers and freight, and the safety devices of every type so far perfected. This convention is not a "stunt" circus, but a serious and practical demonstration of the adaptability of aircraft for commercial purposes. The Army and Navy exhibits at the Atlantic City meeting were valued at more than a million dollars.

The Board of Commerce is back of this aerial meeting and appointments to the executive committee in charge so far made are: Mr. Dunn, chairman; John A. Russell, president of the Board of Commerce and editor of the Michigan Manufacturer and Financial Record; Mayor Couzens and Rev. William T. Doran, S. J., president of the University of Detroit.

An air route is laid out or charted between The committee has not been completed.

The Pulitzer Trophy race is more of a sporting proposition, although its value in the development of aeronautics should not be underestimated. This race meet is fostered by the Detroit Aviation Country Club, an organization of men and women interested in aeronautics from a sporting standpoint. Whether or not Detroit needs additional advertising as a possible aeronautical center of the future, the Pulitzer race and the exposition and touring contest of the aerial leagues will attract attention to the city and should awaken new interest in aeronautics as a fitting subject for commercial and industrial consideration by the city's transportation and industrial men.

In the wake of these major national events, the University of Detroit will proceed with its development of aeronautical educational facilities, and it would seem that in the face of such encouragement that Detroit should begin to lay the foundations of a new industry and prepare for commercial activities in the air.

Detroit's present position in the aeronautic world is to be regretted. Although eight major costal and trauscontinental airways and four air routes have been laid out over the United States, Detroit is not on an airway and is on only one air route. An airway is 80 miles wide, so established because an aviator can see the country beneath him for forty miles on either side of his machine on a clear day.

America's Four Chief Problems

They Are Taxation, Railroads, Labor and Europe; Methods and Spirit to Be Applied to Their Solution

By OTTO H. KAHN

IT IS eighteen months now since America entered into the period of post-bellum reaction. Such a reaction was inevitable. But heretofore of the characteristics of this country has been its resiliency, its quick and vigorous rebound from periods of depression. Why is it that after eighteen months of liquidation and readjustment we are still in the throes of poor trade, tight money, restricted credit, diminished enterprise and employment and general discomfiture?

There are a number of reasons: A war of unprecedented scope and costliness, accompanied by corresponding inflation of currency and production. A peace equally unprecedented in its ill effects and in the deplorable discrepancy between professed aims and actual performance. Governmental incapacity, neglect and blundering. Excessive expansion, overtrading and lack of foresight on the part of a considerable portion of the business community. Exorbitant boosting of the cost of labor and stubborn insistence, in some instances, upon conditions not normally tolerable. Governmental and private extravagance.

But there is one element which more than any other single cause stands in the way of our economic recovery. That is the imprudent, disingenuous and mischievous system of taxation adopted in 1917. Leaving aside its appalling complexity, its irritating and obnoxious cumbersomeness, the unfairness of its incidence and its manifold actual and moral impediments to effort and enterprise, it has produced two effects of fundamental destructiveness: It has prevented the accumulation of new capital and its has violently interfered with the normal flow of existing capital.

Why are borrowers compelled to pay rates of interest without precedent and even at those rates are unable to obtain their requirements? Why are our banking facilities strained to the limit? Why has the process of liquidation, which has been going on more or less for eighteen months, not brought about a commensurate easing in the money situation?

Waylaying the Wayfarer

Why is there no money available for mortgages and building operations? Why has it occurred recently that cities of the highest credit did not receive bids sufficient to cover their offerings of bonds? Why are our Liberty bonds selling at a deplorable discount? Why does the whole machinery of credit and investment creak und groan and fail to work with its former automatic smoothness?

It is mainly because the clumsy hand of faulty taxation has been shoved into the delicately adjusted organization of our commerce and industry. Capital has been driven from the highways of trade because the governments lies in wait and exacts a huge toll going up to three-quarters of the wayfarer's income, hitherto unmindful, too, of the fact that there is no other way called "tax exempt securities" which is not only safer, smoother and less laborious to travel, but is entirely free from toll.

For this throttling of the supply of capital for constructive uses we have chosen the very time when we were most in need of ample supply of funds, because European capital on which we had largely drawn before the war is no longer available to us owing to the effects of the war—indeed, Europe, instead of being a provider of capital, has become an eager borrower here—and because the process of readjusting our industries to peace conditions and bringing our productive capacity in line with post-bellum requirements and opportunities involves a very heavy capital drain.

The underlying trouble with our whole scheme of taxation is that it is based upon and actuated by not plain business-like considerations of revenue-raising but social experimentation plus class and sectional animosity. The theory was to take it out of the rich and take it out of the East. The crudity of that theory was covered by the formula "taxation according to ability to pay." That is a formula to which every fair-minded and right-thinking man will give his adherence in principle, but it must be applied within the limitations of the rule of reason. It was, as a matter of fact, applied with vindictive unreason.

To what degree taxation stays where it is laid is a much debated point. Generally speaking, from considerations both practical and psychological, it may be said that direct taxes are shifted largely in proportion to their burdensomeness. When taxation becomes manifestly oppressive and excessive, whatever its method, it ceases to stay where it is laid, but is shifted and passed on in one way or another, if not avoided altogether.

That process involves trouble and complication and dislocation all along the line. It also involves higher costs and therefore diminished purchasing power, which is bad for everybody. Therefore there is damage done all round.

The attorney-general's department has calculated that the average increase in costs due to federal taxation in twenty-three per cent. To that burden, which is borne by everybody, rich or poor, there must be added the less precisely ascertainable ill-effect which results from the action of our tax laws in causing restraint of business, impediment to enterprise and diminished opportunity for employment.

It all means that errors in taxation are visited on everybody. It means that you cannot take it out of the rich and of the East without also taking it out of the poor and of the West and the South. It means that there is a limit beyond which taxation of income and profit cannot go without inevitable consequences seriously detrimental all round.

Steps to Be Taken

We have far surpassed that limit and there is no remedy for the resulting ills but to recognize the fact in which experience has demonstrated unmistakably, and to retrace our steps.

While continuing progressive income taxation of individuals and a flat tax on corporate earnings we must fix rates within the limits of moderation (the point to which income taxation can go without driving capital into tax exempt securities is indicated by the approximate difference in interest yield between tax exempt and taxable securities; that comparison would denote the "saturation point" to be reached at a tax rate of approximately thirty per cent); we must simplify the system; we must abolish the excess profits tax; we must eliminate minor irksome and invidious special taxes and to the extent that the needs of the government require the resulting reduction of revenue to be made good, we must broaden the basis of indirect taxation.

It requires no prophetic gift to foretell with assurance that by doing so we shall greatly reduce the burden of high costs and other evils resulting from the existing tax system, which now weighs upon the masses of the people, although they were meant and mistakenly calculated and expected to weigh upon a small minority.

I know of no measure which will better and more certainly attain that purpose and bring that relief than a sales tax in some form. Exactly what shape that tax should take—whether it should be on commodities only; whether foodstuffs should be exempted; whether it should be on commodities and services; whether it should follow the model of the Canadian sales tax, which relates only to wholesalers, manufacturers and jobbers; whether the rate should be one-third of one per cent, one-half of one per cent, or one per cent, are debatable questions. (It should not, however, in my opinion, be a tax on retail sales only, for several reasons, one of them being that a simple, practicable and workable definition of what constitutes a retail sale defies the resources of phraseology.).

So much has been written and said on the subject of the sales tax that I will confine myself to the following few observations on the subject:

(1) The often heard argument that large combinations controlling several or all phases of the manufacture of their product, from raw material to finished article, would be materially

HE SUCCEEDS MERRICK

Hugh A. McPherson, Howell, Banking Commissioner

HUGH A. McPHERSON

ALMOST immediately after accepting the resignation of Frank W. Merrick as commissioner of the state banking department, last week, Governor Grossbeck announced the appointment of Hugh A. McPherson, of Howell, as commissioner. Mr. McPherson, who has been cashier of the McPherson State bank, is regarded as one of the very able financiers of Michigan. He was a candidate for state treasurer at the Republican convention, a year or so ago, bnt will draw in favor of Frank E. Gorman.

Digitized by Google

benefited by a sales tax as against ordinary corporations or individuals handling only one process is much less true than it sounds.

To the extent that there is an element of advantage, as naturally there is, in large combinations as against ordinary businesses, it exists now and has always exited. In the face of it, "single process" concerns have successfully carried on business, and will doubtless continue to do so, in the measure that they serve a public convenience or fulfill an economic function.

A trifling sales tax will not affect that situation in any material degree. Moreover, it is quite possible to operate the tax in such a way as to make it applicable to the various principal stages of manufacture, where these processes are combined in or controlled by one corporation.

To the extent that taxation is a factor in intensifying the advantage of large combinations, it is a great deal more so under the present system with the loading of prices incident thereto, than it will be under the application of a small sales tax.

(2) I am satisfied that a sales tax cannot be pyramided to any approchable extent, if at all.

(3) I am satisfied that it is workable without difficulty or inequity and that the various practical objections brought forward by its opponents can all be met.

(4) I am satisfied that a one per cent sales tax imposed on all stages from original producer to final consumer would not aggregate an average of more than three and a half per cent to the ultimate purchaser. (As I have mentioned before, according to the investigation of the Department of Justice, the average increase in ultimate costs due to our existing federal taxes, is not less than twenty-three per cent.)

(5) I am satisfied that a sales tax is approved and demanded by the rank and file of business throughout the country.

The social and economic welfare of the country is inseparably connected with the welfare of its industries. The return to normal conditions of industrial activity is at the moment our most urgent national need. It cannot be accomplished without a wise and courageous revision of our tax laws.

I am convinced that tax revision contains a good deal less political dynamite than many timorous politicians appear to think. I believe that people do not greatly care by what methods or under what names relief is obtained from the present intolerable situation, provided they do get effective relief.

In approaching this subject, let us, at last, clear our minds of cant and refuse to be swayed by catchphrases or well sounding formulae. Let us apply the practical and somewhat painful lessons we have learned as against the preachments of iconoclasts and the doctrines of theorists. Above all, let us give one another credit for decency of motives and integrity of purpose and not indulge in rancorous abuse when we differ. Let us try and settle this thing in calm discussion and with due respect for the realities, whether or not they accord with our preconceptions and predilections. It cannot be truly settled on any other lines.

It is characteristic that the decline in the vigor, vitality and enterprise of railroading has kept steady pace with the enlargement of the powers of the Interstate Commerce Commission over the destinies and the management of the railways. And nothing is more natural.

In the days antedating the Taft administration, under which the functions of the Interstate Commerce Commission received their fundamental and radical enlargement, there were, it is true, certain abuses in railroad practices which called for redress, certain delinquencies which demanded safeguards against repetition, but there was also the American spirit of progress and daring enterprise, there was vision, there was incentive to venturing and risking.

Great pioneers like Huntington and Hill, men of constructive genius like Harriman, saw and found in the building, acquiring, consolidating and managing of railroads a vast field for their splendid capacities. They did mighty work. True, they reaped rich rewards, but the wealth they received was but a trifling fraction of the wealth their genius created for the people.

And now? Nine governmental appointees sitting in Washington hold almost absolute power, together with a wage board sitting in Chicago (not to mention numerous state commissions) over the railroads of the country. Practically nothing of any importance can be done without a hearing before them and without their approval. Initiative has been hindered, vision deadened, daring rendered impossible, decision removed, the qualities of leadership dispossessed, men of commanding ability discouraged from entering the railroad field.

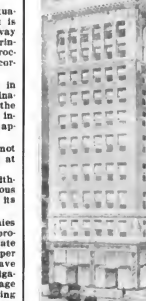
A large part of the time the thoughts and the energies of the chief executives of railroads is given to appearing and arguing before commissions. The routine of bureaucracy and the trial court have been substituted for individual brain work, energy and action. A simply incredible mass of paper work and statistical data of all kinds has taken the place of the few small sheets of essential data which Hill and Harriman used to carry around in their pockets. As Mr. Slason Thompson, of Chicago, wrote recently: "The blank form for the annual report of Class I roads contains over 10,500 spaces for items. When it is considered that some of the items in this veritable wilderness of data run up as high as eleven figures, the colossal nature of what the commission requires of the railways can be vaguely visualized if not comprehended."

No wonder that, as Mr. Thompson calculates, the number of railway clerks has increased from 42,200 in 1895 to 223,830 in 1919, and their compensation has increased from $28,516,000 in 1895 to $307,376,000 in 1919.

I venture to hope—though I know it is to be a rather daring hope—that out of the investigation which will shortly be inaugurated by Senator Cummins' committee into the railroad situation there will come recognition that regulation and control have gone too far and that more scope must again be allowed to the old American method of personal initiative, enterprise and responsibility if the railroads are to be enabled to give the fullest and best measure of service to the people. Of course, the principle of supervision and regulation of the railroads in the public interest has come to stay.

The institution of the Interstate Commerce Commission is both an advantage and a necessity. But it should be entirely possible to attain both the things which I believe a great majority of our people desire to see preserved: namely, on the one hand, governmental surveillance and authority, so as to emphasize the semi-public character and duties of the railroads, protect the community's rights and just claims, and guard against those excesses of unrestrained individualism which experience has indicated; and, on the other hand, private initiative, resourcefulness, zest and responsibility.

It hardly needs affirmation that in the difficult process of bringing our affairs from an artificial and highly inflated basis to a true and normal one, labor cannot be left unscathed. On the whole the workers, unionized or otherwise, have come to recognize that fact, and it is to the credit of the responsible leaders in the camp of the employes, as well as the employers, that thus far the process of reviling the prevailing scale of wages has not led to serious and large-scale breaches of industrial peace.



After all, in the last analysis, these matters all come down to the fair and foresighted use, or otherwise, of power temporarily residing with one party or the other. It is true there is no intoxicant, the "kady" effect of which humankind seems less able to resist than power. Capital had it for many years and failed to keep within the restraints of wisdom and equity; labor had it for the last six years of unlimited demand for workers and became inefficient, extravagant and grasping; the producer had it during the war and, with some conspicuous exceptions, gave pretty free rein to his covetings; the consumer has it now and is far from squeamish about using it.

Yet all experience has shown that abuse of power or even the unwise use of power reacts no less bunefully upon those who practice it than upon those who are subjected to it. It is greatly to be hoped that the bulk of employers will use the present emergency not to get even with labor but to set an example

(Continued on Page 37)

UNDOING FIRE'S WORK

Modern Business Block to Rise in Lansing on Razed Site

THE PRUDDEN BUILDING

WITHIN less than a year Lansing will be able to boast of one of the most modern and handsome mercantile and office buildings in the state, located in the heart of the business district, corner of Washington and Michigan avenues and one block from the state capitol grounds. This will be the 10-story Prudden building, which will occupy the site of the old Prudden block, destroyed by fire this winter. The ruins have been cleared away and the construction will start at once.

The first five floors will be occupied by the Dancer-Brogan department store and the upper stories by offices. The exterior of the first floor will be of green and white marble, the next six stories of gray-toned pressed brick and the remainder of terra cotta.

The contract for the steel has been awarded to the Jarvis Engineering Company, Lansing, at a cost of about $70,000.

The Michigan Legislature of 1921

A Resume of More Important Measures It Passed, Especially As Relating to Business and Industry

By H. BOND BLISS

[Staff Correspondent, Michigan Manufacturer and Financial Record]

LANSING, May 2—Michigan business breathes easier now. The fifty-first Michigan legislature has adjourned after nearly four months of work, and the people know what they face in the way of taxes and new laws. While there has been increased appropriations, the tax rate is not expected to be greatly changed. However, the corporations of the state will be hit by the new special corporation tax. A proposal to tax gasoline failed of enactment. Business and labor legislation played a rather important role during the sessions in the way of discussion, but few vital bills of this character were passed.

The biggest business proposition adopted was that reorganizing the administration of the state government. The numerous departments were combined in a few centralized boards. At the head of these departments in general control is the state administrative board composed of the elective officers of the state, thus furnishing the governor with an official cabinet. Other departments created were those of labor and industry, agriculture, conservation, welfare, and public safety. In each of these departments a commission is provided to take over the duties formerly conducted by the different departments.

Aside from this reformation in state government, probably the next most important action was the passage of the Vandenboom corporation tax bill. This bill levies an annual tax of three and a half mills on all paid-in capital and surplus of corporations in Michigan, with a minimum tax of $50 from any corporation and a maximum of $10,000. It is termed a license fee for the privilege of doing business in the state. It is estimated that $6,000,000 will be derived from this source in time to meet the urgent needs of this calendar year. The raising of money to help pay the bills of the state was the only excuse for the creation of this additional load upon the industry and commerce of Michigan.

The public utilities bills generally did not fare well in either the House or the Senate. The Osborn bill, which its opponents declared threatened to destroy the home rule rights of cities, failed to get out of the upper branch in time to be transmitted to the House for action. Its twin bill, the Dafoe measure, never reached the floor of the House. The bill of Rep. Andrew Giasple to confer upon the public utilities commission the power to fix interurban rates and stipulating what these rates should be according to the earnings per mile, was passed. Another measure that was adopted provided for notices from both parties in the case of contemplated track crossings, this bill growing out of the crossing of the D. U. R. tracks by the Detroit municipal lines.

Other important business legislation included the MacDonald workmen's compensation act; the Lord bill codifying the state's corporation laws; the Vandenboom Great Lakes-Atlantic waterway commission act; the Brewer vestibule cab act; the Penney motor vehicle bill; the Smith measure empowering counties to sell abstracts of title, and others. Automobile owners are largely interested in the passage of the Byrum bill providing for certificates of ownership, requiring every motor owner to possess an abstract of title. This was designed to prevent automobile thievery. The amended MacDonald bank bill was passed, providing that banks may act as administrators and executors of estates. The Welsh newspaper libel bill was finally killed in the Senate. This was aimed at Henry Ford's paper, the Dearborn Independent, and would have prohibited newspapers from attacking, misrepresenting or adversely commenting upon religious cults.

In the House 568 bills were introduced during long session, which ended early Saturday morning, April 30. Of these bills, 285 passed the lower branch and were transmitted to the Senate; 250 died in committee; twenty-three were tabled and ten were killed in committee of the whole or on roll call. Fourteen joint resolutions were offered and five of them passed the lower branch. In the Senate 311 bills were introduced, of which 220 were passed and transmitted to the House and 91 died either in committee or on roll call. Of seven joint resolutions, three passed and four failed. Among the bills stranded in committee were the Holland bill to repeal the act creating the state police; the Holland act for an eight-hour day and a long list of bills to regulate the operation of motor vehicles.

Two important measures, not of a business character, but in which widespread interest was taken, were the Hart capital punishment bill and motion picture censorship, both of which finally failed.

It is estimated that the total budget for the next biennial period will be only slightly above that for the last two years—$35,000,000. Consequently the tax levy is expected to continue about the same as heretofore. There will be $6,000,000 from the corporation tax and $3,000,000 from the usual fees. Efforts were made to provide for an income tax, and this was bitterly fought and defeated. Of great importance in the financial line was the resolution authorizing a constitutional amendment empowering the state to borrow $30,000,000 for the payment of bonus compensation to service men and women of the state.

A wave of economy swept over the admin-

WHY REDUCE? WE FEEL FINE! MUST BE NO FAKE ABOUT THIS TOO MUCH OF THIS!

Digitized by Google

istration and legislature and had some good effect in the slashing of appropriations for the various state institutions and conduct of the government. The fight on the University of Michigan request for $8,690,000 was a feature of the closing session, the University finally being allowed $4,800,000. In practically all other cases materiel reductions were made as follows:

Michigan State Normal, $872,423 (request, $2,031,197); Northern State Normal, $294,545 (request, $549,182); Western State Normal, $707,284 (request, $1,797,570); Central State Normal, $337,254 (request, $789,828); Kalamazoo State Hospital, $1,435,189 (request, $2,509,921); Pontiac State Hospital, $922,303 (request, $1,614,599); Ionia State Hospital, $516,899 (request, $815,337); Michigan School for Blind, $164,319 (request, $208,944); Michigan School for the Deaf, $338,029 (request, $563,895); Michigan Home and Training School, $805,012 (request, $2,018,096); Michigan State Prison, $1,477,900 (request, $6,072,298); Michigan Farm Colony for Epileptics, $401,233 (request, $670,898); State Public School, $184,489 (request, $254,089); Industrial School for Boys, $493,350 (request, $5,659,931); Industrial School for Girls, $377,455 (request, $513,832); Michigan Reformatory, $378,200 (request, $483,400); Marquette prison, $384,102 (request, $352,046); Michigan College of Mines, $299,375 (request, $379,024); Michigan Soldier's Home, $540,000 (request, $1,088,070); State Psychopathic Hospital, $133,513 (request, $194,723); State Department of Agriculture, $906,491 (no request); Conservation department, $666,518 (no request); National Guard, $525,000 (request, $1,514,048); Michigan Agricultural College, $990,000 (request, $2,295,000); department of public instruction, $215,210 (request, $682,965); Department of Public Safety, $700,000 (no request); Public Utilities Commission, $254,500 (request, $287,400).

Copies of the new Michigan automobile registration law and blanks will be sent all owners of motor vehicles by the Department of State. On and after October 1, 1921, no new motor vehicle may be purchased or used car sold without first obtaining from the Secretary of State a certificate of title. In the resale of a car the certificate must be transferred and returned to the Secretary of State so a new one may be issued. By July 1, 1922, every motor vehicle must be registered and a certificate of title issued.

After January 1, 1922, it will be unlawful for any person to engage in the business of dealing in motor automobiles without an annual license of $5. The fees for registering are $1 and the same for transfers. Penalties for driving a car without a certificate are fines of not less than $5 nor more than $50, with heavier penalties for false statements in applying for registration.

As a further step to eliminate the stealing of automobiles all sheriffs and police chiefs are to report stolen cars to the Secretary of State, and lists of these are to be published monthly together with those recovered.

Organizing the Farmer to Feed Detroit

IN LOVE, possibly, absence makes the heart fonder, but in business it usually stimulates suspicion. Because the farmer has been an absentee from the city, the consumer of farm products has given the problems of the farmer only scant attention, beginning and ending at the dinner table. On the other hand, the farmer, isolated from the city's inner life most of the time, has noted only the shorter working hours, the increased facilities for living at any rate from one to 100 horsepower, with the result he has been as biased as the city man in his judgment of the affairs of the city.

Through his agricultural organizations the farmer has gained little knowledge of city economics because his own organization is exclusively agricultural and distinctly class conscious. Some organization or economic unit that would bring the city and the agricultural thought together has ever been the missing link.

This situation has been patent to John A. Russell, president of the Detroit Board of Commerce, and from a systematic study of Mr. Russell has worked out what he believes will be the link needed. It is an agricultural division of the Board of Commerce, a department directed by men who know both farm and city problems, with perhaps enough leaning to the farm side of the fence to offset any tendency to magnify the city side to the exclusion of the agricultural view.

The board of Commerce has approved Mr. Russell's idea and such a division is now in the making. Charles A. Bingham, a farmer all his life engaged in agricultural work close to the city, and extremely popular with farmers throughout the state, has been made director of the division.

Mr. Bingham, after passing through the vicissitudes of the battle with the soil, conceived the idea of the Michigan Farm Bureau and "sold" it to the farmers of the state, with the result that the Bureau was organized with nearly 100,000 members and conducted successfully by him until other interests seized upon it and eliminated him. From the time Mr. Bingham began his organization work he had the assistance of James P. Powers, a newspaper man, whose first work was publicity, but who later became assistant secretary to Mr. Bingham as secretary. Mr. Powers will assume the position of assistant director of the Board of Commerce, agricultural division.

The initial work of this division will be confined to the counties of Wayne, Oakland, Monroe, Washtenaw, Macomb and parts of St Clair, Lapeer, Genesee and Livingston. In this territory nearly one-half of the total population of the state resides. At one time the Detroit district was supplied by a host of market gardens sending into the city tons of produce. While these gardens have diminished, the estimated number of food producers in this territory is about 15,000.

In a general way, the efforts of the new division of agriculture will be:

To remove the misconceptions that there are any real or just causes for a conflict of opinion and interest between the city and the farms.

To encourage the development of the largest proximate food supply, laid down in the city without the necessity of high priced short hauls by railroads, with less unloading and loading expense and less complex distribution.

To find the points of contact between the city and the farm and draw to and within these points all those present divergent thoughts and interests.

To extend to the farmers non-resident membership privileges in the Detroit Board of Commerce, giving them a common meeting place in the city, and the advantages of such membership.

To set to work such agencies as exist, or seek new agencies if needed, to drain and prepare present marsh and swamp land for farm uses and encourage more and better farming and fertilizing on these lands.

To work for the improvement of existing roads necessary to the distribution of farm products, and find where new, short-cut roads might be constructed so that the general inter-county system can be more useful to all the counties and marketing.

As the establishment of public markets has fallen far behind the increase in population so that well populated districts are not served at all, the new division of agriculture will seek the location of more of these markets.

Standardized seasonal credit for small as well as larger farmers at the periods of the year when farm finances are needed will be considered one of the advantages to be sought.

There are times of the year when there is a glut of fruit or vegetables, and because there has been no way of advertising to consumers the possibility and advisability of buying for home preservation, wastage occurs. It is believed that through this division of agriculture city consumers could be made aware of fruit and vegetable supplies and a demand created.

Along the same line some effort can be made to encourage closer and better grading with a view to holding out culls and poorer produce for animal food, thus increasing animal husbandry and bringing to the city fresh food instead of "canned" fruit and vegetables.

The division will foster meat animal clubs among children on the farms, such as pig, calf, sheep and chicken clubs.

The problem of adequate storage for farm produce will also be taken up so that in seasons of plenty, food supplies can be held for short seasons and off-seasons.

The division will work in the interest of farm colonization with a view to developing unused lands adjacent to the city and increasing the city's food supply as the population grows.

With the Detroit Board of Commerce as city headquarters and groups organized throughout the counties mentioned, it is believed that the new division of agriculture can create a spirit of co-operation and build up a mutual understanding which both the farmers and the city dwellers need and desire.

YEAR'S COAL OUTPUT REPORT

The Department of the Interior has compiled a chart showing the average production of bituminous coal per working day for each month for the coal year just closed—April 1, 1920, to March 31, 1921—and how this compared with the production during the pre-war years 1913 to 1917. It shows that while the output from last April to about the middle of January of this year averaged higher per month than during the years previous to the war, the decrease in production since the middle of January has been so large that at the close of the 1920-1921 year the average was below the 1914-1915 average, when, as we say in official announcement, a business rection was in progress.

The average daily output was about 1,100,000 tons when the coal year ended, compared with a high average of better than 2,100,000 tons at the end of last October. When the coal year began in April, 1920, the daily average was better than 1,400,000 tons.

For the first week of the new coal year, April 9, 1921, the output of bituminous was 6,059,000 tons, or 3,600,000 less than a year ago, but 200,000 tons better than during the week ended April 2. The output of anthracite for the week ended April 9 was about 1,865,000 tons, as compared with 1,157,000 for the previous week and 1,538,000 for the corresponding week in 1920.

Carload shipments made from the mines show a sizeable increase for the week of April 9, the total of anthracite shipped being 35,661, as compared with 22,120 for the week of April 2, while bituminous carloads shipped numbered 113,245 as compared against 108,154.

Motor Upgrade Evidenced By Orders in Lansing

Several Lansing concerns identified with the automotive industry report an increase of business, with good prospects for the future. The Auto Body Company is receiving releases from a number of automobile and truck manufacturers, including one from the Briscoe Motor Corporation, Jackson, for 1,000 bodies for May. Increased releases have also been made by the Scripps-Booth, Olds Motor Works, Auburn and General Motors Truck companies. The Auto Body company is now employing 350 men and will increase this force 150 within thirty days.

The payroll of the Motor Wheel Corporation is now larger than at any time since the first of the year. Four hundred more men are employed in the three units than were on the payroll 60 days ago. The Prudden plant in Lansing is turning out the largest volume of business. The Ford and other concerns with which Motor Wheel has contracts, are expanding their activities. Truck business, however, is reported to be light.

The Kirchen Machine Company is planning extensive additions to its plants to provide for increased orders for parts coming in from all parts of the state. The expansion move comes in connection with the new partnership between O. J. Kirchen, formerly sole proprietor of the plant, and W. G. Conway, Lansing. The second floor and basement of the plant will be opened, giving 5,200 additional feet of floor space. A new carbonizing unit is being installed, while a welding process will also be in operation. The company will manufacture Smith-Spencer piston rings, piston pins, bearings, bushings and primers, orders for these having been received from the Olds Motor Works and Howell Electric Motors Company, while business is also being done with Brighton and Grand Rapids concerns. New machines and stock are arriving daily.

The Lansing Company reports a growing business in road making products, including cement mixers and road scrapers.

LA FOLLETTE HEARING OPENS

A delegation of about 100 representatives of business enterprises in the states bordering the Great Lakes appeared this week before the merchant marine and fisheries committee of the national House of Representatives at the opening of the hearings on proposed changes in the LaFollette Seamen's Act. Detroit was represented by the following:

Shippers—Harvey B. Wallace, vice-president, Board of Commerce; R. J. MacLean, chairman, inland waterways committee, Board of Commerce; L. E. Williams, marine manager, United Fuel & Supply Company; J. G. Liddle, shipbuilder, Wyandotte; M. L. Miller, Detroit real estate operator and Put-in-Bay produce grower; Arthur T. Waterfall, vice-president and assistant general manager Dodge Brothers; Frederick Stockwell, Edson-Moore & Co.; Fred. Meyer, superintendent, Wabash Railway Company; Tom L. Munger, Board of Commerce; J. E. Maynard, Beecher, Peck & Lewis; Lewis W. Lindemann, St. Clair Flats Improvement Association, R. E. Johnson, traffic manager Burroughs Adding Machine Company; J. H. McBride, Penberthy Injector Company; also representatives of the Ford Motor Company and Paige-Detroit Motor Car Company.

Vessel owners and operators—A. A. Schantz, president, Detroit & Cleveland Navigation Company; C. L. Perkins, general superintendent, Detroit & Cleveland Navigation Company; Captain F. J. Simpson, Detroit & Cleveland Navigation Company; Captain A. E. Dustin, Ashley & Dustin lines; O. J. Dustin, Ashley & Dustin lines; C. F. Bielman, Jr., White Star lines.

EVERTON ENGRAVING CO. MOVES

The Everton Engraving Company, Detroit, has removed from the Marquette building, Congress street west and Wayne street, to the Kerr building, at Beaubien street and Fort street east, where it occupies the entire second floor. Its facilities at the new address have been increased.

STRAIGHT LINE METHODS

The Eyes of Business

Sound Methods of Cost Accounting Safeguard Your Profits

Business, without exact knowledge based on facts and figures, is blind business. Blind business is bad business. With material and labor costs changing over night, sales volume fluctuating, prices declining, profits must be safeguarded.

Sound Methods of Cost Accounting, applied by competent organization, are the watchful eyes of business, probing every department, establishing the actual sources of profits, detecting every loss. They furnish the executive *at all times* with comprehensive and dependable facts and figures—the rock basis of intelligent, progressive action.

Sound Cost Accounting is business insurance, as necessary as fire and liability, use and occupancy insurance. It guarantees the same security. The low expense of applying it is a premium to *insure* profits, as well as an investment to *increase* profits.

Marmon and Jordan Cut Prices

Former Reduces $600 to $900, Latter $1,015 to $1,400; Advance-Rumely Co. Scales Down Its Tractor List

BY MARC BRAUN

IMPORTANT price reductions have been announced during the last week by two of the best known makers of motor cars and one producer of tractors. The Jordan Motor Car Company, Cleveland, has slashed its list figures from $600 to $900, depending on the model, while the Nordyke & Marmon Company, Indianapolis, has taken time by the forelock and cut from $1,015 to $1,400 from the prices of its various models. The manufacturer reducing the price of its tractor is Advance-Rumely, of Laporte, Ind., and Battle Creek, Mich.

A statement by Edward S. Jordan, president of the Jordan company gives the reasons for the new price policy which took effect on May 1. The statement says:

"It has always been the desire and the ultimate purpose of the Jordan company to produce the best car we possibly could for the money.

"Last year at this period we began to approach for the first time since the inception of the company, a volume of production which meant a very marked decrease in our overhead.

"Previous to that time owing to war restrictions and the difficulty of getting materials, we had been unable to obtain a production sufficient to meet the normal demand for Jordan cars.

"Last June we made plans for a monthly production which would have made it possible for us to reduce the price of Jordan cars materially before the end of the year 1920.

"Business conditions began to change in July, by October sales conditions were such that our production began to fall off instead of increasing. Therefore it was impossible for us to realize our aim.

"During the past six months we have been successful in reducing our inventory to a point where we are now buying and taking delivery on all material necessary to production.

"Two months ago we did not anticipate that the spring demand would be sufficient to warrant a production which would make possible any change in price.

"The improvement in sales has been so marked during the last six weeks that by the first of May we were building more cars for sale at old prices than we had ever built before.

"We believe, therefore, that this is the opportune time for the Jordan company to place the car within the reach of a much larger number of people, to command the attention of dealers who desire a car in the new Jordan price class, and further extend our organization and production.

"The Jordan company, owing to the fact that we have liquidated our inventory, is in a strong financial position, and in spite of slow production during the winter months we have met all obligations in a satisfactory manner."

Following are the old and new Jordan prices:

	Old	New
5-Pass. Silhouette	$2,850	$2,250
Playboy	2,850	2,250
5-Pass. Sedan	3,950	3,300
Brougham	3,950	3,300
7-Pass. Silhouette	3,075	2,475
Custom Landaulet	4,200	3,300
7-Pass Sedan	4,200	3,700

A statement from the Nordyke & Marmon company says that the new prices are the 1922 figures and that the reductions are based on the revisions in prices the company expects it eventually will obtain in raw materials and lowered manufacturing costs.

"We have made this revision at the earliest opportunity—six months sooner than anticipated," says the statement. "We make one complete reduction, instead of several steps downward. Our new price is based on the anticipated lowered production costs of the next eighteen months."

The old and new Marmon prices are as follows:

	Old	New
4-Pass Touring	$5,000	$3,935
7-Pass Touring	5,000	3,935
4-Pass Roadster	5,000	3,935
Speedster	5,300	4,185
Coupe	6,150	4,875
Sedan	6,600	5,375
Limousine	6,600	5,400
Town Car	6,800	5,400

Persistent rumors that Dodge Brothers contemplated a price reduction have brought forth a statement from the corporation, signed by F. J. Haynes, president, that the reports are "absolutely false." Telegrams to this effect have been sent to Dodge distributors, with instructions to pass the word on to their dealers. Nevertheless, the rumors persist.

In the case of the three other Detroit concerns it has been learned that price reductions planned may be effective most any day, yet the officials deny any such plans have been formulated.

In announcing reductions of from $300 to $685 on its tractors, according to the model, the Advance-Rumely Company, says:

"The reduction of steel prices cannot affect our present costs because our materials are all in our yards bought at the old prices. It does, however, establish a lower replacement cost and justifies us in immediately taking our loss on the higher priced materials on hand and with this loss written off we are able to establish our costs on a lower basis.

"Our reductions are considerably greater than the reduction in steel prices, but we have in mind similar or even greater reductions made or yet to be made in other materials, besides reductions in wages already made in our shops.

"Moreover, we believe it sound business to get our prices down to a stable level for the remainder of this year, that our customers may have confidence in buying their seasonal requirements without the fear of further decline in our prices during the year."

NO RENT LAW FOR THE PRESENT

Governor Groesbeck has advised Prosecutor Paul W. Voorhies, of Wayne county, that he believes it would be inadvisable, "at least for the present," to put a rent law on the statute books of the state. The governor says any such legislation at this time would tend only to discourage building, and building is what is needed to take care of the rent situation.

GEAR MANUFACTURERS MEET

The following Detroit concerns were represented last week at the 1921 convention of the American Gear Manufacturers' Association, in Cincinnati: Detroit Gear & Machine Company, Gear Grinding Machine Company, John Lauer Machine Company, Timken-Detroit Axle Company, Western Gear Company, Cross Gear & Engine Company, and Michigan Gear & Engine Company.

Every Firestone Employe Now a Stockholder

THE TREND of American wage earners' thought and action toward new habits of thrift and investment is evidenced in the announcement of the Firestone Tire & Rubber Company, Akron, late last week, that every one of its several thousand employes had become stockholders in the company.

Within twelve hours after announcement by President H. S. Firestone of a new allotment of employes' stock, subscription records showed that every employe had become a stockholder, each subscriber taking at least two shares, while oversubscriptions on the allotment amounted to almost fifty per cent.

This places the Firestone company in a distinctive position among industrial concerns employing more than 10,000 persons, as it is the only organization of its rank on record having every man and woman on its payroll a shareholder in the company. It brings the total number of shares subscribed for by employes close to 45,000.

So quick was the response to the stock ownership privilege and so large the subscriptions that officials of the company are expected to consider alloting an additional amount of shares for purchase by employes.

In offering the stock to workers in the Firestone factories Mr. Firestone wrote to each employe:

"For most of us it is not easy to acquire the habit of saving. We need a special inducement and this common stock plan is an opportunity not only to create the habit of saving but to become a stockholder in the company."

In commenting upon the reception given the company's offer by the employes, Mr. Firestone said:

"Aside from the great personal gratification in the matter, there is, I believe, a far-reaching significance in this recent experience of our company. A year ago advice about thrift and savings was lost in the whirl of prosperity that carried extravagance and waste everywhere.

"It took the experience of the last eight or ten months to teach us that there is no short cut to permanent prosperity—that there is no substitute for work and thrift in the attainment of happiness and prosperity. How well that lesson has been learned is proved by the reception which our stock offer received.

"One of the main ideas behind this new stock allotment was to encourage the habit of thrift and saving among our organization and give all an opportunity to become stockholders. The company feels that its employes have not only shown their loyalty and faith in the future of the organization but have demonstrated to the country that there is a sound economic spirit abroad among the wage earners."

Two of the outstanding features of the Firestone plan have been to furnish employes with a six per cent savings account and at the same time give them the advantage of sharing in the prosperity and profits of the company through dividends and the increase in the market value of their stockholdings.

The company had made two previous offers of stock to employes, with special payment plans at a price below the market value. But not until the last stock purchase offer has the company been able to state that every one of the thousands of men and women on its payroll is part owner in the enterprise.

FIRE PREVENTION MEASURES

The fire prevention committee of the Detroit Board of Commerce is distributing to householders a special card bearing the inscription: "A Delayed Alarm Does the Harm," which will be affixed to a picture of a firm alarm box with general instructions for sending in fire alarms and fire prevention.

PONTIAC PLANTS OPERATING

The Wilson Foundry & Machine Company, Pontiac, will be on a 50 per cent production basis, according to officials, by May 15. The latest order is for the largest tire mold ever turned out in this plant. The plants of O. J. Beaudette Company and Michigan Drop Forge are increasing production.

ANSTEAD VISITS DETROIT

Frank B. Anstead, president of the Lexington Motor Car Company and the United States Automotive Corporation, Connersville, Ind., visited Detroit last week on the final lap of a 7,000-mile trip through the western part of the United States investigating business conditions. He says the country commercially is on "high ground" and the while business probably will continue variable for some time, he has no doubt of the outcome. Mr. Anstead was the Detroit guest of W. D. Block, of the W. D. Block Motor Company, Marmon and Lexington distributor.

SPARTA BUSINESS MEN ELECT

The annual banquet of the Sparta Business Men's Association a few days ago was attended by 130 persons. The election of officers resulted as follows: President, Erastus W. Smith; vice-president, J. H. Brace; secretary, William Rogers; treasurer, A. A. Johnson; trustees, Milo Bolender and S. C. Field.

MAKING 2,000 TIRES DAILY

A. F. Osterloh, vice-president and general sales manager of the Goodyear Tire & Rubber Company of California, announced this week that the company was now turning out 2,000 tires daily, as against 700 on March 18. This is the fourth production increase notice issued by California Goodyear within a month.

FRANKLIN GAINS 10 PER CENT

A statement from the Franklin factory, at Syracuse, N. Y., is to the effect that the company's business for the first twenty days of April was ten per cent larger than for the similar period in March.

ACME PRICES TO STAND

C. J. Heim, secretary and sales manager of the Acme Motor Truck Company, Cadillac, announces that there will be no material change in prices of the company's product. He calls attention to the fact that during the war the concern did not materially advance its prices and that in consequence recessions of any importance are ont of the question now.

NAPOLEON MOTORS' ORDERS

It is reported from Traverse City that the Napoleon Motors Company has received orders in sufficient quantity to justify the belief that the plant will be operating at capacity within thirty days. Napoleon is concentrating on steel truck bodies for road construction work.

KEYSTONE PLANT BURNS

Fire late last week destroyed the factory of the Keystone Tire & Rubber Company, at Erie, Pa. The loss is estimated at $500,000. The plant had not been operating for five months but a crew had just started work on the interior, preparatory to a resumption of activities in the near future. The company employs 1,400 men when on a normal schedule.

O. R. COOK'S NEW CONNECTION

Otis R. Cook, for ten years vice-president and general sales manager of the Kelly-Springfield Tire Company, on May 1 became vice-president, director and sales manager of the Howe Rubber Company, Brunswick, N. J., in which he has purchased a substantial interest. His headquarters will be in Cleveland.

WHITE AT ONE-THIRD CAPACITY

It is reported that the White Motor Company, Cleveland, is turning out about 100 trucks daily. This is approximately one-third of capacity.

PIERCE-ARROW SHIPMENTS

It is stated that the Pierce-Arrow Motor Car Company, Buffalo, N. Y., is producing and shipping at the rate of 300 passenger cars a month, or 3,600 cars a year, in 1920 the company made a total of 3,172 passenger cars and 2,076 trucks. Truck output now is still somewhat below the 1920 average, it is said.

DOW-METAL DEMAND BRISK

The Dow Chemical Company, Midland, announces that its Dow-Metal division is now machining all its Dow-Metal products in the company's newly equipped special machine plant. The company has been making metallic magnesium for about six years and has specialized on pistons for motors and airplanes for the last three years.

Dow Metal is composed almost entirely of magnesium and is made from a natural salt brine pumped from the mineral wells near Midland. It is one-third lighter than aluminum and one-fourth the weight of cast iron. All processes from the taking of the metal from the salt brine to turning out the piston finished ready to go into the cylinder of an engine are performed at the Dow plant. Orders sufficient to keep the Dow Metal division at capacity indefinitely are on hand.

KEYSTONE TIRE & RUBBER CO.

A net loss of $317,704 for the year ended December 31, 1920, is reported by the Keystone Tire & Rubber Company. After deduction of expenses, interest and taxes, this loss was shown, and the deficit after establishing a reserve for inventory depreciation was $384,624.

CITY PATTERN WORKS PURCHASE

The City Pattern Works, Detroit, has purchased the factory and foundry building at Harper avenue and Rivard street, now occupied by the Utility Compressor Company and the Detroit Torch Company. The plant has been leased to the former owners until August, when the new owners expect to remodel the buildings into the largest and finest equipped pattern institution in the country. Wood and metal patterns and foundry equipment will be manufactured.

OLD TIMERS' PLANS

The second meeting of directors of the Old Timers Club was held in New York a few days ago at the office of Vice-President Gregory Flynn. Others present were Alfred Reeves, general manager of the National Automobile Chamber of Commerce; A. G. Batcheller, chairman of the executive committee of the American Automobile Association; Richard Kennerdell, chairman of the contest board of the Association; C. G. Sinsabaugh, editor of Motor Life; Albert Champion, president of the Old Timers Club, and F. Ed Spooner, secretary. It was decided that the club would hold annual reunions at the time of the annual automobile shows in New York and Chicago, and though local sections have get-together meeting during local shows.

MARTIN-PARRY PROFITS

The annual statement of the Martin Parry Corporation, Indianapolis, automobile body builder, shows that for 1920 net profits after charges and taxes were $311,300. Assets on December 31 totaled $3,408,963 and the net surplus was $1,245,823. Sales during the year totaled $3,725,406. President F. M. Small in his report to the stockholders says: "The year 1920 has seen the realization of plans for the manufacture of a standardized engineered line of commercial bodies, built sectionally. As this method of manufacture was a radical departure in commercial body construction, considerable revamping of both our plants was necessary. The result has been greatly to reduce manufacturing and transportation costs and substantially to increase production capacity."

KNAUSS TO SELL AIRCRAFT

The Stout Engineering Laboratories, Inc., Detroit, will begin production in the Beaubien street plant within a short time. Stanley E. Knauss, formerly sales and advertising manager of the Continental Aircraft, Inc., has been made sales manager.

Rice Succeeds Collins; Hannum Sent to Oakland

Two important personnel changes affecting Michigan plants of the organization have been announced during the last week by the General Motors Corporation. The first was that George H. Hannum, who has been manager of the Saginaw Products division, had been made general manager of the Oakland Motor Car Company, Pontiac, succeeding Fred W. Warner, resigned. The second was that H. H. Rice, formerly treasurer of the corporation and lately vice-president, had been appointed president and general manager of the Cadillac Motor Car Company, succeeding Richard H. Collins, resigned.

Mr. Hannum, who is one of the outstanding figures in Saginaw business and civic life, being president of the Board of Commerce, a director of the Bank of Saginaw, vice-president of the Saginaw Shipbuilding Company and a director of the Saginaw Financing Corporation, left the Detroit Lubricator Company in 1912 to accept the shop superintendency of the Wilcox Engineering Company. This was one of the first industries taken over by the General Motors in Saginaw.

Mr. Warner, who has managed the Oakland for seven years, will remain as a vice-president and director of GMC. Previous to joining the corporation he was identified with the farm implement industry.

The resignation of Mr. Collins, who is casting his lot with his old chief, William C. Durant, in Durant Motors, was announced exclusively in this paper on April 16. It has since been reported from New York that he will become the head of the Michigan Durant corporation.

Mr. Rice has been connected with General Motors a number of years.

REPORTS ON EUROPEAN SITUATION

The Lansing Auto Dealers' Association at its most recent meeting heard an address by Elijah Poxson, European representative of the Dort Motor Car Company, who has recently returned from an overseas tour. Mr. Poxson reported prospects for export trade as dark. He said foreign exchange rates must be adjusted before export trade in automobiles can become profitable. In Germany, Austria and Hungary he found the people spending all their money for food and necessities, and declared they will be for a long time to come. There is little manufacturing, and with the plants closed many are unemployed. He attended the London automobile show, where he saw European manufacturing conditions reflected. Many of the large English automobile concerns are turning out only 250 to 300 cars a year, he reported.

DUPLEX TRUCK'S NEW SALES PLAN

Frank B. Willis, sales manager of the Duplex Truck Company, Lansing, has outlined a new sales policy for his organization, the main principle of which is vocational selling—selling trucks for the job after a comprehensive survey of the character and needs of the job to be done. In a sense it is selling transportation rather than merely a truck unit, it being assumed that after the analysis of the prospect's problem has been made, the truck sold will provide the transportation he needs at the lowest initial cost and upkeep cost. Much of the work will be done by a sales research department, the findings of which will be sent to the prospect and to the dealers from the factory. The company now has 44 types of bodies and 22 classes of equipment listed. The country has been divided into 14 zones, and vocations into 21 classes.

GOODYEAR PROMOTES MORGAN

The Goodyear Tire & Rubber Company has promoted Fred L. Morgan, manager of the Cleveland branch, to the position of manager of the automobile tire sales division.

COMMERCIAL HAULING

TRUCKS FARE WELL IN LEGISLATURE

Motor trucks fared well in the 1921 session of the Michigan legislature. Out of fourteen measures introduced, affecting the commercial hauling industry, most were defeated. Bills were passed requiring trucks exceeding one and one-half ton capacity to be equipped with mirrors; horse drawn vehicles were required to display lights at night, and the weight limit on trucks was revised downward slightly.

The legislation proposed covered everything from excessive licensing, with the idea of driving trucks off the highways altogether, to relief for certain sections of the state where seasons for operating are short, and there were several efforts to bring highway transport under the control of the public utilities commission. All of them died in committee or in the house where they originated. Here is a resume of the legislation:

Senate bill 88, by Senator Penney. Permitted increase of speed limit to thirty miles an hour from twenty-five miles and regulated glaring headlights. Passed Senate. House added provision for rear end signal device, which killed the measure.

House bill 341, by J. E. Warner. Limited weight of trucks to fourteen tons, using the manufacturers' rating as official. This replaced the former rating scale, based on tire sizes. Former limit, fifteen tons. Passed and signed by the governor.

Senate bill 279, by Senator Bryant, provided placing motor truck operation under the public utilities commission. Died in committee.

House bill 323, by Rep. Strauch. Placed trucks under control of public utilities commission, also provided five per cent tax on gross receipts of trucks operated for hire on state roads. Favorably reported out of committee on roads and bridges and placed on general orders. Recalled after public hearing and reported back with a clause added providing those affected by the law to be bonded. Second time from committee it was reported with recommendation and the House voted to table it, where it was when the session ended.

House bill 549, by Rep. Atwood, provided for a tax of one cent a gallon on gasoline. Died in committee.

House bill 105 and Senate bill 103, provided reducing license fees on automobiles when taken out after certain portions of the license year had elapsed. Defeated.

House bill 278, by Rep. Dafoe. This was the "home rule" act, and one of its provisions was to give the utilities commission control of trucking on state highways.

House bill 164, by Rep. Danz, and House bill 142, by Danz, both aimed to increase license fees approximately 200 per cent, with the idea of driving trucks off highways, on the ground that they were breaking down roads. Killed in Committee.

House bill 129, by Rep. Lennon, sought to attack a motor vehicle for damages. Killed in committee.

House bill 131, by Rep. Coleman, compelled drivers of horse-drawn vehicles on highways to equip vehicles with lights at night. Passed both houses and signed by the governor.

House bill 57, by Rep. DeWitt, provided for displaying of mirror on trucks of capacity exceeding one and one-half ton in small communities and over highways. Passed both houses and approved by governor.

House bill 25, by Rep. McDonald, sought to give Upper Peninsula automobile operators relief from licenses owing to shortness of operating season. Defeated.

Senate bill 305, sought to place motor buses under the public utilities commission. Defeated.

A LECTURE ON COSTS

E. A. Andrews, transportation engineer of the Packard Motor Company, truck division, delivered an illustrated lecture on the operating costs of 3½ and 5-ton stake body trucks and 5-ton dump trucks at the meeting of the Detroit Transportation Association in the new headquarters, 1038 Third avenue, recently. These costs were averages taken on actual truck operating experiences in Detroit hauling and are minimum costs:

INVESTMENT

	3½-ton Stake	5-ton Stake	5-ton Dump
Chassis	$4,450.00	$5,550.00	$5,550.00
Body (Estimated)	500.00	550.00	1,250.00
Cab (Weatherproof)	175.00	175.00	175.00
War Tax (Approximate)	155.00	195.00	265.00
Total	$5,280.00	$6,470.00	$6,970.00
Less Tire Value	354.00	452.00	452.00
Basis for sinking fund	$4,926.00	$6,057.00	$6,525.00

FIXED CHARGES PER DAY

Interest—Computed on total investment cost, at 6% on 5-yr. Book life.	.594	.721	.87
Insurance—Liability, Collisions, theft, fire, property damage	1.76	2.136	2.136
License	.122	.163	.163
Driver's Wages	6.00	6.00	6.00
Garage	.50	.50	.75
	$8.976	$9.530	$9.919

VARIABLE CHARGES PER MILE.

Fuel at .259	.0618	.0647	.074
Lubricants at .72	.0043	.005	.005
Maintenance—Tire repair and overhaul	.0343	.047	.047
Tires—10,000-mile life	.0356	.0453	.045
Sinking fund—300,000-mile life	.0092	.009	.009
Total variable charges per mile	$ .1709	$ .2960	$ .222

Total operating cost will be found by multiplying the cost per mile by the number of miles traveled plus the fixed charges per day.

During the discussion following the lecture two points were brought up. One was that the depreciation item should be larger on dump than on stake body trucks, and the other was the claim that the cost per mile increases when a truck is operating on hauls of more than 50 miles a day.

If a man is running a trucking business he must consider other charges besides operating costs, such as these:

Rent or office (if rented).
Rent of office (if owned), also interest on investment.
Telephone.
Light, heat and water.
Stationary and postage.
Advertising.
Claims for damages and losses and lost employment.
Compensation insurance, covering employes.
Idle time during which driver is paid.
Lay time. Time during which fixed charges continue.
Furniture and fixtures. Interest on, depreciation, taxes and insurance.
Interest on notes (other than those on truck) and bad accounts.
Expense of personal solicitation of business.
Expense of keeping books.
Allowance for supervision (Salary of owner of cartage business).

TUCKER RETURNS TO OMAHA

Charles A. Tucker, sales manager of the Olds Motor Works, Lansing, has resigned to return to Omaha to manage the Nebraska Oldsmobile Company, of which he is president.

HANCH GOES TO INDIANAPOLIS

One of the best known men in the automotive industry, Charles C. Hanch, has become associated with the Homer McKee Advertising Agency, Indianapolis. Up to recently Mr. Hanch was general manager of the Maxwell and Chalmers companies; previous to that he was for several ears treasurer of the Studebaker Corporation. For a period of nearly 20 years he was connected with the Nordyke & Marmon Company, of Indianapolis, as treasurer.

New Crop of Reports Out On Collins-Durant Plans

According to a New York dispatch to a Detroit newspaper, R. H. Collins, who recently resigned as president and general manager of the Cadillac Motor Car Company, will organize a motor car corporation to be known as the Collins Motor Car Company, with a plant in Detroit. The corporation, the reports say, will be capitalized at $10,000,000 under Michigan laws and will show a product by Janury 1, 1922. Mr. Collins is said to have told interviewers from New York papers that he intended forming such a company and that W. C. Durant, formerly head of the General Motors Corporation, would be a large stockholder. Another report is that Mr. Collins will organize a company in Cleveland.

Simultaneous with the Collins report rumors of a merger of the new Durant Motors, Studebaker and Pierce-Arrow Motor Car companies have set New York stockbrokers on edge. It was reported that a holding company would be formed, the stock of which would be exchanged for that of the three companies. No confirmation of this rumor has been made. It was reported some time ago that the above companies and the Continental Motors Corporation would be merged, but W. R. Angell, secretary of the Continental, denied that his company was concerned or interested in any such combine.

The relative values of the stock of the three companies are as follows: Durant Motors, $25 a share; Pierce-Arrow, $60 a share; Studebaker, $125 a share. Pierce-Arrow stock has been active on the exchange, where 57,600 shares changed hands, indicating to some brokers that a merger is in sight.

While Pierce-Arrow earnings have shown no marked improvement, those of Studebaker averaged $3.25 a share on common stock, nearly twice the dividend requirements, during the first three months of the year.

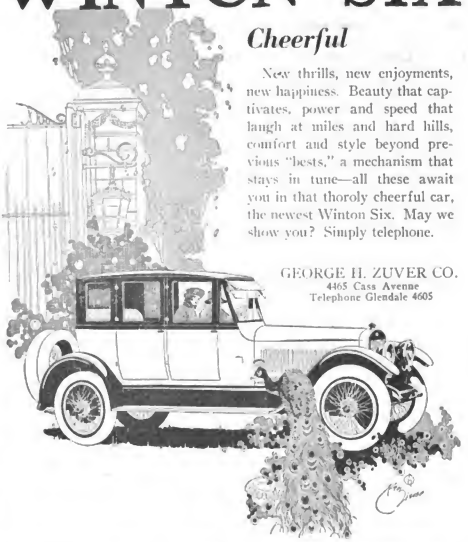
A month or so ago it was reported that Frederick S. Fish, chairman of the board of directors of the Studebaker Corporation; A. R. Erskine, president of the Corporation, and Mr. Durant has obtained control of the concern, but no confirmation of this report has been made. All these reports and rumors center about the expectation that Mr. Durant, having left the General Motors, will not be conient until he has organized another motor combine as great and powerful as the General Motors.

GOODRICH REDUCES PRICES

The B. F. Goodrich Rubber Company, Akron, in announcing a 20 per cent reduction in Goodrich tires, effective May 2, has made the following statement:

"We feel that our readjustment of prices is radical and that at one move it puts prices at the bottom. Undoubtedly there will be increases in the prices of many commodities before the summer is over, for the reason that the lack of buying is holding back production in many lines and this will naturally bring about a shortage of supplies.

"Putting business on a normal basis is not a job for one man or one concern. The public can do this better than any other force, and it will find both manufacturers and dealers more than ready to co-operate. Conditions in the automotive industry seem to be much better and the outlook much brighter, and, of course, this will be reflected in the tire industry.



"Fair wages, honest products, right prices and a square deal all around are what will give producer, distributor and public real confidence. Recognizing this, we put our prices at the point we have announced."

TRANSPORTATION NEWS

Rail :: :: *Water*

Washington—The railroads serving ports on Lake Erie have filed application with the Interstate Commerce Commission for permission to reduce the rate on hituminous coal from the fields in Pennsylvania, West Virginia, Kentucky, Tennessee and Ohio 25 cents a ton, in order to stimulate shipments by these routes, for trans-shipment by boat on Lakes Erie, Michigan and Superior. The proposed reduction does not affect the lower peninsula of Michigan.

Washington—Berry Bros., Detroit paint and varnish manufacturers, have lost their case against the Chicago & North Western Railway Company et al., before the Interstate Commerce Commission, which has decided that the rates applicable on wood alcohol, in tank-car loads, from Ashland, Wis., to Detroit, are not unreasonable. The complaint, No. 11445, submitted December 18, 1920, and decided April 11, 1921, has been dismissed.

Washington—In the case of the Climax Molybdenum Company vs. the director general of railroads, as agent, the Ann Arbor Railroad Company, et al., (Docket No. 10245, submitted June 6, 1919, and decided March 29, 1921), the Interstate Commerce Commission has decided that the rates assessed on complainant's shipments of molybdenum, in carloads, from Climax, Col., to destinations on and east of the Missouri river via Denver, are legally applicable and not unreasonable, unduly prejudicial or unlawful under Section 20 of the Interstate Commerce Act. The complaint has been dismissed.

Washington—The rates charged Earl C. Anthony, Inc., by the Michigan Central Railroad Company et al., on a mixed carload of freight and passenger automobile chassis from Detroit to San Francisco, were applicable and not unreasonable but were unjustly discriminatory and unduly prejudicial, according to a decision handed down by the Interstate Commerce Commission on March 26 and just made public. A non-discriminatory rate was prescribed for the future but reparation was denied. The case, No. 11322 on the Commission's docket, was submitted on January 3, 1921.

Washington—In the case of the traffic bureau of the Chamber of Commerce of LaCrosse, Wis., vs. the Ann Arbor Railroad et al., the Interstate Commerce Commission has decided that the class rates from eastern points to LaCrosse are unreasonable and unduly prejudicial and has prescribed reasonable and non-prejudicial rates. The case, which was No. 11325 on the Commission's docket, was submitted on November 18, 1920, and decided April 2, 1921.

Washington—Rates in green salted hides, in carloads, from Chicago, Ill., and Racine and Milwaukee, Wis., to Rockford, Mich., have been found unreasonable and unduly prejudicial by the Interstate Commerce Commission in the case of the Hirth-Krause Company, shoe manufacturer of Rockford, vs. the director general of railroads, as agent, the Chicago, Milwaukee & St. Paul Railway Company, et al. Reparation was awarded and the measure of reasonable maximum and non-prejudicial rates prescribed. The case, No. 11223 on the Commission's docket, was submitted on October 20, 1920, and decided March 3, 1921.

Washington—The interstate Commerce Commission has decided in the case of the Harlan County Coal Operators Association vs. the Louisville & Nashville Railroad Company et al., that the rate of $1.90 per net ton charged for the transportation of carloads of bituminous coal from mines in Groups 1, 3 and 4 on the L. & N., in Kentucky, to Toledo, for trans-shipment by lake, on and after May 6, 1920, and as increased rates pursuant to Increased Rates, 1920, 58 I. C. C., 220, were not unreasonable. Reparation was denied and the case dismissed. No. 11559, submitted February 24, 1921, and decided April 9, 1921.

Muskegon—Muskegon, Mason, Oceana, Manistee and Ottawa counties have joined forces in a drive to build the Lake Michigan shore connections necessary for a thorough road from Manistee to Chicago. These connections would make a direct line through to Petoskey. Former Lieutenant Governor John Q. Ross, of Muskegon, was named chairman of the permanent organization. Charles L. Churchill, of Ottawa county; H. W. Smith, of Manistee; Justus Stearns, of Mason, and William L. Loutit, of Ottawa, are the other members. This body will confer with the Pere Marquette officials at once.

D. & C. Navigation Co. Cuts Rates 15 Per Cent

A fifteen per cent reduction in all classes of freight rates, including automobiles and trucks, on all Detroit & Cleveland Navigation Company lines was announced last week by A. A. Schantz, president and general manager of the corporation. The Detroit & Cleveland is the first company on the Great Lakes to cut its freight rates. The new schedule went into effect Thursday, April 28.

"We are lowering our rates in line with the general movement of today to bring prices down," said Mr. Schantz. "Conditions will not return to normal until prices as a whole come down, and we are doing our part to bring them down. We believe, too, that in the long run it will bring greater prosperity to us. Business needs encouragement and stimulation. High freight rates block business. That is our thought in lowering our freight rates.

"If we can help the flow of freight business between Detroit and Cleveland and between Detroit and Buffalo, the three great industrial cities on Lake Erie, in just that degree are we helping to bring back normal conditions in these three cities.

"The reduced rates also offer to shippers economy and speed in shipping their merchandise between Detroit and Cleveland and Detroit and Buffalo, because the reduction more than offsets the cost of transporting the merchandise from factory and warehouse to D. & C. docks."

Steamers of the D. & C. Navigation Company are now operating daily between Detroit and Cleveland and will start operating daily between Detroit and Buffalo about the middle of May.

BLOOD WITH RAY BATTERY CO

Wallace Blood, vice-president of the Campbell, Blood & Trump Advertising agency, Detroit, has become director of sales of the Ray Battery Company, Ypsilanti. Mr. Blood will continue as vice-president of the agency, but his activities will be confined to advisory service.

M. U. R. DECLARES OPEN SHOP

The Michigan United Railway Company has declared for the open shop on all its lines, beginning June 1. Lines affected are, Jackson, Battle Creek, Kalamazoo, Grand Rapids and Owosso interurbans and Jackson, Lansing, Battle Creek and Kalamazoo city lines.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—Work has been started on the construction of a $40,000 garage for W. H. Perry, in Kalamazoo street, opposite General park. The building will be one-story, 49½ by 132 feet, and will accommodate 150 automobiles, with a show room in connection. It will be of brick and plate glass construction and is to be completed before the end of summer.

Flint—Activities in Flint are increasing steadily, Building Inspector E. C. Shannon has announced that from March 1 to April 10, 381 permits were issued, aggregating in outlay about $407,000. Of 53 permits for houses, 25 were for structures to cost $3,500 or more each and 28 for buildings to cost less than $3,500. The chief permit was for a storage house to cost $125,000, the next largest item being for a roller coaster for an amusement park, involving $30,000.

Detroit—Contracts awarded by architects during the week ended April 28 consisted mostly of residences, stores and garages, according to the list issued by the Builders and Traders' Exchange. Among the new projects coming from the offices of architects, flats, residences and stores predominate. Generally speaking, there is no great activity so far as industrial construction work is concerned.

Lansing—Wages of Lansing plumbers, effective May 1, have been reduced from $1 an hour to 80 cents, while the plumbing contractors have reduced their charges from $1.50 to $1.25 an hour.

Detroit—During the week of April 30 the total number of building permits issued was 630, as compared with 306 for the week of April 23 and 486 issued during the corresponding week in 1920. The cost involved was $1,486,675, as compared with $989,335 for the previous week and $2,268,866 a year ago. Of the 630 permits, 275 were for new construction and 155 for alterations or additions.

Grand Rapids—Building activities are beginning to approach those of pre-war times. During the first three months of the year there have been taken out 78 permits for new residences, to cost $270,300; 122 permits for residential construction, $58,765; eleven for commercial construction, $89,500; seven for industrial construction, $242,000; ten for industrial reconstruction, $23,565, and 166 for house garages, $45,875.

Cheboygan—The Producers' & Consumers' Company, Cheboygan and Detroit, is reported to be planning to enlarge its local plant.

Grand Rapids—Seventy-eight permits were issued during the week ended April 22 and they involved an expenditure of $125,669, the second high week thus far this year. Of the total, sixteen were for new buildings to cost $103,600. The list included a church to cost $35,000; a three-story factory building, 70x90 feet, to cost $18,000, and a number of residences and garages.

Niles—The French Paper Company will erect a one-story office building and a power plant. Other improvements will be made during the year.

Grand Rapids—The school board has accepted the bids of John McNabb & Son for the new North Junior High School, to cost $416,400, and of $138,823 for the Lafayette School.

Detroit—Confirmed bids on city building materials follow: Truscon Steel Company, Youngstown, O., 30,000 steel plates for trunk sewers, $33,125; Barber Asphalt Paving Company, 1,500 tons asphalt in packages, $24.50 a ton; Atlantic Refining Company, Philadelphia, 1,500 tons asphalt in packages, $24.45 a ton; 2,000 tons in tank cars, $18.97.

Grand Rapids—A three-story addition, 60 by 110 feet, will be erected by the Gunn Furniture Company.

Cheboygan—The Michigan Central Railroad has begun the construction of a siding for the Cheboygan Tile & Brick Company. As soon as this work is completed the company will start the erection of its new factory.

Grand Rapids—Chicago manufacturers of common brick are quoting $14.32, delivered on the cars in Grand Rapids. The old price was $19.05. The reduction is about 25 per cent. Face brick is lower, but the reduction varies according to kind and color made.

Grand Rapids—The Jennings Manufacturing Company, which makes extracts, perfumery and toilet preparations, has purchased a factory site.

New Sand and Gravel Rates Delayed 10 Days

Following a hearing on the protest against existing switching rates in Detroit on sand and gravel, held in Lansing this week before the Michigan Public Utilities Commission, the Commission decided to postpone the application of the reduced traffic rates until May 20. Reductions of 25 per cent in rates in the Lower Peninsula zones and 22 per cent in the Upper Peninsula were to become effective May 10.

While the Commission was considering the line haul tariffs, the Material Dealers' Credit Bureau, Detroit, filed a petition for readjustment of the switching rates, claiming they were levied by the ton, whereas other commodities carried a per-car rate, also that the existing rates were discriminatory in that ex-river sand and gravel producers were paying as high a switching rate to move cars short distances as pit producers were for long haule, and the difference in rates for pit producers located considerable distance from the market were so much greater in proportion than those charged pits closer to the market that they were grossly discriminatory.

The Commission called a hearing on the protest and the bureau's case was presented by Thomas B. Moore, of Beaumont, Smith & Harris. The railroads entered objections to the claims of the materials dealers, but the Commission, at adjournment, decided that some readjustment in rates should be made, both in line hauls and switching. The Commission will continue its investigations and announce its new schedules before the rates heretofore decided become effective.

W. E. Metzger Distributor Of New Wills Sainte Claire

William E. Metzger, vice-president of the Columbia Motors Company, Detroit, and one of the best known men in the automotive industry, will be the Detroit distributor for the new Wills Sainte Claire car manufactured by C. H. Wills & Company, Marysville, according to reliable reports. Official announcement of Mr. Metzger's plans will be made later. It is understood that Mr. Metzger will have his salesroom in the former Ford sales and service building, Woodward avenue and Grand Boulevard. The Wills Sainte Claire car embodies several basic patents held by C. H. Wills, has a V-type motor, eight cylinders, set at an angle of 60 degrees. It has a 121-inch wheelbase and weighs about 3,000 pounds. Molybdenum steel is used. Magnetically controlled headlights and a rear light which illumines the back of the car when driven backwards, are features.

It was the construction of the new car that made necessary the establishment of a new industrial center at Marysville, and a large community has grown up around the plants of the C. H. Wills & Company. Mr. Wills announced the car several months ago, and deliveries have been made to key distributors.

Boat Manufacturer Seeks Site for Michigan Plant

A Detroit business man who has obtained the manufacturing rights for five states for the construction of a motor-driven small boat having numerous unique features, is seeking a plant site in some small Michigan town. Floor space of at least 15,000 to 20,000 square feet will be needed, as the manufacturer will produce at least 1,000 boats the first year. The plant must be located on or near a body of water sufficiently large to test boats of the rowing and small launch type, and also on or near a railroad. The rights have been obtained for Michigan, Wisconsin, Ohio, Illinois and Indiana.

The product is not entirely new in the market, but the boat is said to be a distinct innovation among motor craft. The three-horsepower, single cylinder marine motor weighs only forty pounds, is nearly silent in operation and drives an ordinary rowboat type of craft nine miles an hour with a gasoline consumption of twenty to twenty-three miles a gallon.

The principal patented feature of the boat is the disappearing propeller, which is so connected with the motor that it can be raised or lowered for any depth of water by the simple operation of a lever. Another patented feature is the automatic propeller protection, consisting of a skeg, which is a section of the keelson. The propeller is shipped amidships, just abaft the skeg. If the boat strikes an obstacle below water the skeg comes into contact first and automatically raises the propeller up into the housing and throttles down the engine.

The location of the propeller, shaft and skeg provides the same balancing medium as does the centerboard of a yacht. The engine is located in a housing between the forward quarters and can be entirely concealed by the second athwartship seat. Each boat has four seats—stern and stern and two athwartship. These are easily removable to make room for fishing or hunting paraphernalia. Besides the small model, two other types are made, one 16½ feet long, four feet 11 inches beam and one foot, eight inches draft. The weight is 400 pounds.

The boat has been on the market long enough to build up a good demand. It was exhibited at the New York Motor Boat Show and a large number of them were sold.

Smaller communities desirous of attracting a year-around industry may get into touch with the manufacturer by communicating with this paper.

Mr. Mellon's Taxation Ideas

WELL, WELL, Mr. Mellon has "gone and done it" too. In his letter this week to Congressman J. W. Fordney, chairman of the House ways and means committee, the Secretary of the Treasury says he doesn't see how we are going to get along without a federal tax on automobiles. We weren't so very much surprised when Mr. Houston suggested it when he was holding down Mellon's job, because Houston's regular business was secretarying agriculture; but the suggestion from a man of Mellon's training shocks us a little. We supposed he, of all people, understood thoroughly the fact that automotive vehicles are just as truly units of transportation as are railroad cars and locomotives, and, as such, should not be called upon to bear any greater share of the burden of taxation than the latter. But it appears that he does not.

His recommendation, if it ever reaches the floor of the House in the shape of a bill, is going to cause the automotive industry a lot of bother, but it probably won't do much more harm than that. The men responsible for the industry's welfare will be put to the trouble of trotting down to Washington once more and producing all the figures again, after which the framers of the new tax bill will gently but firmly table the automobile levy and substitute something else.

Mr. Mellon wants the luxury taxes, which he characterizes as "nuisance taxes," repealed. Well, luxury taxes may be a "nuisance," but of all the levies we are called upon to pay, we can best pay these. The woman who insists on painting herself up to resemble nothing so much as a futurist landscape should be made to pay the Government for the privilege of doing so, even if the revenue stamp attached to the package of rouge costs a dollar and a half. Those of us who have the hardihood to sit for three hours in the theater and listen to some of the drivel that "gets by" in these latter days in the name of drama are gluttons enough for punishment to pay another dollar to the Government as a ticket tax. Those who guzzle some of the brands of patent medicine because they're cheaper than the bootlegger's stuff should be willing to pay the revenue bureau more than the two cents charged for the stamp on the bottle. And those of us who consider it an insult to our manly figures to drape them in anything less than a nineteen-dollar silk shirt or thrust our dainty "dogs" into anything less expensive than a seven-dollar pair of silk socks, should be good sports enough to "divvy" with the Government for the blessed privilege of humoring ourselves. Yes, there are a lot of things more unjust than the luxury taxes, even if the latter are a "nuisance," and now is a pretty good time to admit it, when we are trying to get back to the place where washboards take precedence over ouija boards.

Nobody will quarrel with Mr. Mellon's recommendation that the excess profits tax be done away with. The conviction that this form of impost has outlived its usefulness is too nearly unanimous. It is only to be hoped that the substitute proposed—an additional flat tax upon the earnings of corporations—will be so levied as not to work in effect the same evil charged to the excess profits tax—the driving of capital out of productive enterprise and into tax-free investments. The flat tax probably will be enacted, no matter what organized business says about it, for Congress understands politics, and it would never do to make the levies directly on the public pocketbook, when the corporations can be made to pay. The people at the moment do not remember that they foot the bill in the end. If it costs more to produce a commodity, whether the higher costs represent materials, labor or taxes, the selling price must go up just that much.

The Secretary touches a responsive chord when he calls for real economy in government. "The last Congress," he says, "made a creditable record in reducing appropriations," but the expenditures for the current fiscal year are running at the rate of $5,000,000,000. "The Government cannot continue spending at this shocking rate." After all, if the present administration wishes to get down to brass tacks it must realize that its job consists as much in seeking to close avenues of expenditure as in opening new avenues for the inflow of funds. The proposition is two-fold, and especially so in view of the fact that we have changed over from war conditions to peace conditions. When we were fighting for our lives it was a question of getting the materials, no matter what the cost. Today no such need exists. The cost becomes the paramount consideration.

Incidentally Mr. Mellon touches on another proposition which will meet with the approval of all sound economists, and that has to do with tax-exempt securities being floated with such lavish hand by state and municipal governments. The Secretary estimates that there is in existence more than $10,000,000,000 of such paper, constituting "an economic evil of the first magnitude," in that it not only contributes to the volume of public debt, but deprives productive enterprise of capital. The federal government, having set an example, he says, should take action to put a stop to the tax-exempt security issuing habit of local and state governments. It may well be doubted whether the federal authority can be made to extend this far, but frowning on the practice may be an influence in the right direction.

A Good Man Out of His Element

DR. FRANK CRANE as a power for good in the world is no inconsiderable factor. He lifts up thousands from inertia and complacency to a keener realization of man's duty to his brother. But when he starts talking economics and finance he gets sadly beyond his depth.

There is nothing in the discussion of economics which will ever command big headlines. Hundreds of years have demonstrated certain truths about finance which men pass on to succeeding generations through textbooks and lectures. But none of it is food for oratory, for it is the soberest kind of discussion. Instead of appealing to the imagination, finance appeals to reflection. It is a question merely of "What happened last time this was tried?" And the continued stability of the whole financial structure of this country depends on hewing close to those precepts which have been wrought out of years of experience.

Not long ago our venerable friend Dr. Crane espoused the

Digitized by Google

cause of currency issues secured by real estate and now he comes out as a supporter of Prof. Irving Fisher's adjustable gold dollar. Among his statements with reference to this subject he says: "Chaos in the world of business is the result of the rise and fall of prices. It is the ups and downs of prices that cause the fluctuation in wages and foment industrial trouble. Few thinkers have gone to the bottom of things and inquired for the fundamental cause of this fluctuation. One of these few, however, is Prof. Irving Fisher, of Yale University. His answer to the question is that the prices of commodities go up and down not because their values alter, but because the value of the gold dollar alters in which they must ultimately be paid."

Now let us consider for a moment the latter statement—that prices go up and down not because their values alter but because the value of the gold dollar alters. Apply this rule, if you will, to the action of the price of potatoes when the farmers bring in more potatoes than the public can consume. Is it the variation in the basic value of the gold dollar or is it oversupply that makes the values drop? We submit that the housewife is thinking very little about the value of a gold dollar when the crop is either short or abundant. If space permitted, one could furnish thousands of similar illustrations.

Going further, "Prof. Fisher's solution is to vary the weight of the gold dollar in accordance with the 'index number' or average price of standard commodities." What we should like to know is this: If index numbers are based on the gold dollar as a standard of measurement of values, what happens when we use the index numbers to vary the value of the dollar? In other words, if we measure length, height and width of an article by a yardstick and then change the yardstick according as the length, height and width may vary from time to time, what do we gain? We submit that there would result merely more confusion and uneasiness in the minds of everyone.

One of the greatest pests of the day are the people who continually keep the country "in a stew" over things that can't be helped. Let a man preach methods demonstrated by hundreds of years of experience and he gets an apathetic audience, but let another man propose turning something upside down, and the applause is quick. But we see signs of improvement, nevertheless. The time is not far off when the people will take counsel of the more conservative preachers amongst us. With all the defects, all the profiteers, all the labor union bosses, all the graft, all the high taxes and other scourges too numerous to mention, this United States of America is still by far the best place in the world to live in.

Governor Allen, of Kansas, has figured it out that organized labor officials in this country draw salaries of $60,000,000 a year "out of the slender pockets of union men." Imagine a group of capitalists spending $60,000,000 a year for propaganda—what a rumpus union labor would set up!

"Hitting the Dirt"

THE APRIL NUMBER of Printers' Ink Monthly features a story that ought to be an inspiration to every manufacturing or merchandising organization in these days of slack business. It is the story of a Dodge Brothers dealer drive in New York city, in which thirty-six salesmen covered the metropolis "with a fine tooth comb" in just nine weeks, working days, nights and Sundays, on foot and in motor cars, and in that time pushed the agency's record 2,000 above the previous year's mark, gathered a list of 100,000 real prospects to follow up on and increased the February, 1921, business over that of February, 1919, which, as everybody knows, was one of the banner months of a banner year for motor vehicle sales.

The city was divided into zones, each in charge of a trained salesman as director of operations therein, and with three assistants who worked for and reported to him. The assistants were young men, inexperienced in the automobile business, but they WORKED. They worked in daylight and after dark, seven days a week, and averaged twenty-eight successful calls a day. The zone directors WORKED two days on the dealers' floors, two days in their respective territories on foot and two days with a car. They made no first calls, but confined themselves to following up their assistants, trying to close sales. Live prospects were those who might buy a car in thirty days, while deferred prospects were those likely to buy in sixty days. All with whom it was impossible to close were listed on cards, and will receive another call from an experienced salesman on the day they themselves have specified.

Probably the most surprising thing about the drive is that sales were made where the salesmen and sales directors—and probably the purchasers themselves—least expected it. The Dodge dealers have proved to their own satisfaction that there is a good deal more business to be had than most people suppose, if only you go after it. Can any one estimate the stimulating effect of such knowledge? In addition to that, they have the name of every Dodge prospect in the metropolis, and know just when each prospect can be closed.

That's what comes of "hitting the dirt." "pounding the pavement"—whatever you choose to call it—in these dull times.

It must be terribly trying to be a union labor leader. They're raising the devil now with Gompers because while on his recent honeymoon he was so thoughtless as to stop at a "scab" hotel.

"Workers in Russia fix their own wages," reads a newspaper headline. That would be very nice indeed if only they could collect them.

Short Measure Stuff

NAIL AND FAREWELL.

Now is the legislature homeward bound,
And Lansing sees them go with gladsome cries,
To trade and barter or to till the ground
And pester all their friends with allbis;
The lobbyists must all return to work.
Gone are the fat expense accounts and clover,
No longer honest labor can they shirk.
By bragging how they're going to put it over.
Three cheers for peace, no politics awhile,
Emerge, ye yokels, from your deep depression;
We're free from squabbles, please dust off a smile,
And keep it on until the special session.

Nobody lost, none got it in the neck,
Except the guy who has to pay the check.

* * *

Says a headline in the Detroit Times:

Husband Finds Wife in Better Health After Paperhanger's Visit

Oh, how I love you, Dear Old Kaiso mine.

* * *

It beats all how hard the Tigers have to fight to lose some of their games.

* * *

ECO.

There's a tenor lives above me,
Conceited as can be:
His only song
The whole day long,
Is mi, mi, mi, mi, mi.
—R. M. T.

There's a baritone I know,
Gee, you ought to hear him blow
That he lives for Art—not Money;
But I think it's very funny
All his songs begin with do.
—L. R. G. in New York Evening Mail.

Their duets will slam your ear drums.
Knock them backward for a goal;
And when you cry out for mercy,
They'll insist you have no sol.
—A. F.

FINANCIAL

Financial Advertisers' Program About Complete

The program for the departmental meetings of the Financial Advertisers' Association, in connection with the Associated Advertising Clubs' convention, at Atlanta, June 12-16, is practically complete. The program committee of the Association has taken "Inside Stuff" as its keynote in outlining topics and selecting speakers. It has planned a discussion of the actual problems which face the men or women responsible for the expenditure of a bank's advertising appropriation. The speakers selected are men and women who have been and are in daily contact with those problems.

Only two of the speakers who will appear at the three sessions are people not actually on the firing line of bank advertising management. One of these is Thomas B. McAdam, president of the Merchants' National Bank, Richmond, Va., and first vice-president of the American Bankers' Association, and the other is Herbert S. Houston, publisher of World's Work.

Mr. McAdam will have for his topic, "The Salable Bank," and will show what the head of a financial institution can do to make his goods worth advertising and how he can obtain co-operation with the advertising men, directors, officials and employes. Mr. Houston is expected to conduct a sort of clinical discussion, with himself as the subject. He will discuss "Financial Advertising From the Reader's Angle," and tell the Association just how its work is impressing the people for whom it is published.

Among other speakers, with their subjects, are the following: A. E. Bryson, of Halsey, Stuart & Company, Chicago and Detroit, "Popularizing Bonds;" L. A. Mershon, secretary, committee on publicity, trust division, American Bankers' Association, "Selling Trust Department Service;" W. Frank McClure, Fort Dearborn National Bank, Chicago, "The Bank House Organ;" J. A. Abernathy, First National Bank, Fordyce, Kas., "Financial Advertising From the County Seat," and Minnie A. Bubbee, American Bank of Commerce & Trust Company, Little Rock, Ark., "Increasing the Per Capita Savings Balance."

GEDDES TO ADDRESS BANKERS

Sir Eric Geddes has been engaged by Secretary Charles H. Ayres to address the spring meeting of the Bankers Club of Detroit, May 9, at the D. A. C.

AN UNIQUE FINANCING PLAN

A study of the financing plan by which the Northern Assurance Company, Detroit, has purchased the American Life Insurance Company, Des Moines, Iowa, reveals something new and unique in methods of financing.

The Northern Assurance Company through its directors formed the Northern Company for the purpose of effecting the merger. It then used its paid-in capital of $240,000 and borrowed $360,000 additional to buy the American Life Insurance Company. The interesting part of the scheme is the method by which the Northern Company borrowed $360,000; which is as follows: The purchase contract between the "Northern" and "American" companies was assigned to a trustee as collateral, thus securing the loan of $360,000 by the purchase contract (which has since been reduced to other having a value of $600,000. The loan is further secured by the guaranty of the Northern Assurance Company, which has assumed a direct obligation to pay these bonds by consenting and agreeing to the trust indenture given by the Northern Company to the Detroit Trust Company, trustee. There is a further safeguard of a sinking fund consisting of five per cent of the entire premium income of the Northern Assurance Company, which has been approved by the Insurance Commission at Lansing; and the merger has been approved by the insurance commissioners of both Iowa and Michigan.

The originators of this financing are John Langley, of Langley, Hildner & Company, Grand Rapids and Ann Arbor; Baker Simonds & Company, and A. E. Kusterer, Grand Rapids.

A RECORD LIFE POLICY

The Pontiac Employees Mutual Benefit Association, an organization which includes 5,000 employes of twenty of the most important industrial institutions of the city, has concluded a contract with the Detroit Life Insurance Company for $1,500,000 life insurance on all the members of its organization. This is the largest contract ever placed in the United States through an association.

The Pontiac organization started business two years ago. It provides sick and health benefits for its members and has met its obligations regularly in addition to accumulating substantial surplus. Within 90 days, in the opinion of the secretary and manager, S. S. Skelton, the number of employes will be increased to 6,000, and the total amount of insurance will reach $3,000,000.

Business Meets New Conditions

American business has been clearing decks. Budgets have been revised. Every buying, selling and production unit has been overhauled and made ready for intensive service. Economy has been the test—economy of time and effort.

In any study of functions and readjusting of methods, the work done by your bank balance should not be overlooked. Has it been merely a checking account and a basis for commercial credit? Or has it brought to the aid of your organization other constructive services? Are you making use now of all the help it should provide?

Many business men who carry deposits with the Irving or with Irving correspondents have discovered broader service possibilities in their banking connections The Irving investigates markets as well as credits, expedites deliveries of merchandise as well as collections, supplements the information resources of its customers both in domestic and foreign fields. Every transaction it undertakes, either at home or over-seas, is handled with a clear understanding of business essentials as well as careful attention to banking requirements.

Michigan Bond Items

The special election held in Saginaw recently on the issuance of $950,000 of school bonds resulted in the indorsement of the project, 1,033 to 124.

Taxpayers of the Flint union school district have voted to increase the interest rate on $2,500,000 of school bonds from 5 to 6 per cent, the paper having failed thus far to find a taker. The proceeds of the issue will be devoted to the erection of a high school building, two grade buildings and additions to two others.

Authority to issue $3,231,000 of first mortgage gold bonds to defray cost of improvements and purchase of equipment has been asked of the Interstate Commerce Commission by the Pere Marquette Railway.

Announcement is made that the state administrative board has authorized the issuance of a $3,000,000 highway bond issue to be dated June 1 to provide for construction work this summer. It is reported that the bankers of the state have agreed to place the issue.

At a special election on May 24 the voters of Ironwood will pass on proposals to increase the rate of taxation from one and a half to two per cent of the assessed valuation, raise the bonding limit from four to five per cent and increase the rate of interest payable on bonding issues.

A special election will be held in Allegan, May 16, to decide the question of issuing $12,000 of bonds for the purpose of sinking another well for the water works and installing necessary pumping machinery.

An election scheduled for May 16 is to decide whether Algonac is to extend its water mains. The proposed bond issue calls for $12,000.

Permission to issue $2,000,000 of 6 per cent improvement and extension bonds, in lieu of similar 5 per cent bonds, and to retire $590,000 of its outstanding $2,500,000 of 5 per cent bonds has been asked of the Interstate Commerce Commission by the Ann Arbor Railroad Company.

The Detroit United Railway was to take up on May 1 $855,000 of Detroit & Northwestern Railway first mortgage 4½ per cent bonds.

INTERNATIONAL HARVESTER

The detailed statement of the International Harvester Company for 1920 shows that profits totalled $16,655,353, as compared with $12,608,726 in 1919 and $14,985,325 in 1918. This was before deducting dividends. The net profit and loss surplus, December 31, 1920, was $68,350,741, while in 1919 it was $71,645,388 and in 1918 $68,036,662. The company's total assets were $289,609,401, as against $266,668,416 in 1919 and $283,218,991 in 1918.

IN ARREARS ON U. S. TAXES

According to M. A. Sullivan, representative of the Bureau of Internal Revenue, who reached Detroit last week to check up on payments of federal capital stock tax by corporations, many concerns have failed to pay these taxes in two years. The tax is $1 per $1,000 on a fair valuation of the stock. A penalty of $1,000 may be imposed for failure to make a return.

WABASH RAILWAY

For the year ended December 31, last, the Wabash Railway reports income of $1,983,942, after deduction of taxes and charges, this being equal to $2.69 a share on the $64,184,000 of preferred stock A, comparing with $3.81 a share on $62,187,100 of similar stock a year ago.

THE COST OF ACCIDENTS

Many employers of labor believe the premium they pay for compensation insurance represents the entire cost of industrial accidents in their plant.

This is a serious mistake, for in addition to the compensation and medical costs paid by the insurance company under their policy, there is a substantial additional cost in the loss of services of experienced men, in the idle time of machines, and in additional spoilage caused by inexperienced men taking the place of those disabled by accident.

There is no insurance policy which covers this loss. It can be prevented only by eliminating the accidents which cause it.

Seventy-five per cent of industrial accidents are preventable and though its Safety Engineering Department, comprising a corps of experts in accident prevention work, the Michigan Mutual will actively aid you in removing this economic waste from YOUR business.

This added service costs no more—in fact it usually costs much *less*—than the mere financial protection against PART of your accident loss provided by compensation insurance in most companies.

Let us show you how to put your insurance on a THRIFT basis—how to make your premium an *investment* instead of an unproductive *expense*.

Write today—NOW. A postal will do.

Wanted: Experienced Bond Salesman, by an important investment house, territory Detroit. Answer Box N. C., Michigan Manufacturer and Financial Record, 611 Free Press Bldg., Detroit, Mich.

ROAD BONDS FOR SALE.

The undersigned will receive sealed bids at their office Ionia Michigan, up to one o'clock p. m., Eastern time, Tuesday, May 10, A. D. 1921, for the sale of approximately sixty-seven thousand dollars ($67,000.00) worth of serial bonds for Assessment District Road No. 8.

Said bonds are being issued under the provisions of Act 59, Public Acts of 1915 as amended and are the obligation of the townships of Portland and Danby in Ionia county and assessment district No. 8.

Said bonds will mature from 1 to 10 years, interest being payable semi-annually and bonds payable at maturity.

Each bidder is requested to name the rate of interest required (not exceeding 6 per cent) and premium he will pay, in his bid.

Denomination of the bonds will be made to suit the purchaser.

For information regarding the nature of bonds and copies of the act under which they are issued, address the undersigned.

A certified check in the sum of 2 per cent of the amount of the bonds, payable to the order of the Board of County Road Commissioners will be required with each bid.

The right is hereby reserved to reject any or all bids.

FRED W. GREEN,
FRED H. KNOX,
R. H. HALL,
Board of Ionia County Road Commissioners.

ROAD BONDS FOR SALE.

The undersigned will receive sealed bids at their office, Ionia, Michigan, up to one o'clock p. m., Eastern time, Tuesday, May 10, A. D. 1921, for the sale of approximately fourteen thousand dollars ($14,000.00) worth of serial bonds for Assessment District Road No. 5.

Said bonds are being issued under the provisions of Act 59, Public Acts of 1915 as amended and are the obligation of the township of Portland in Ionia county, and assessment district No. 5.

Said bonds will mature from 1 to 5 years, interest being payable semi-annually and bonds payable at maturity.

Each bidder is requested to name the rate of interest required (not exceeding 6 per cent) and premium he will pay, in his bid.

Denomination of the bonds will be made to suit the purchaser.

For information regarding the nature of bonds and copies of the act under which they are issued, address the undersigned.

A certified check in the sum of 2 per cent of the amount of the bonds, payable to the order of the Board of County Road Commissioners will be required with each bid.

The right is hereby reserved to reject any or all bids.

FRED W. GREEN,
FRED H. KNOX,
R. H. HALL,

Board of Ionia County Road Commissioners.

School Savings "Teller" Is Gaining a Wide Vogue

A notable increase in interest and sales during the last few months is reported by the American Banking Machine Corporation, Saginaw, which makes the "Automatic Receiving Teller," a device installed by banks in public schools to receive penny, nickel, dime and quarter deposits from children. The device has been given favorable mention by the Savings Bank Section of the American Bankers' Association.

When a pupil makes a deposit of a coin in the Automatic Receiving Teller, the machine discharges a stamp for the amount deposited, which the pupil pastes in a folder resembling the folders supplied by the Government for War Savings Stamps. When $1 worth of stamps have been placed in the booklet, the latter is taken to the bank under whose auspices the machines are installed, and credit given on a regular savings deposit book. One of the attractive features thus is that the teacher is relieved of the responsibility of looking after the deposits.

Among the cities in which banks are using the machines in the schools are Saginaw; Cambridge and Lawrence, Mass; New Orleans, La.; Highland Park, Mich.; New Haven and New London, Conn.; Oak Park, Ill., and Bloomfield, N. J.

The main office and plant of the American Banking Machine Corporation is at Saginaw, while branch offices are in New York and Chicago.

ALLIS-CHALMERS STATEMENT

The annual statement of the Allis-Chalmers Manufacturing Company, Milwaukee, for the year 1920, shows net profits of $3,564,248, as compared with $3,599,714 in 1919; $4,625,866 in 1918 and $4,010,490 in 1917. Total surplus after taking care of dividends was $1,647,207, as against $1,819,540 the year before and $3,006,444 in 1918. Total assets at the end of 1920 were $64,020,650. In 1919 the total was $61,000,417; in 1918, $63,791,930 and in 1917, $54,893,595. In his report to the stockholders, President Otto H. Falk says: "The value of unfilled orders on hand at the close of the year, including all customers' contracts unbilled and in various stages of completion, was $17,046,724. The total bookings for 1920 were $32,696,566.

HARRIMAN'S NEW LOCATION

Harriman & Company, members of the New York Stock Exchange, have moved their Detroit offices from the Dime Bank building to 123 Fort street west, ground floor of the Moffat building.

P. R. R. DIVIDEND CUT

The Pennsylvania Railroad Company has reduced its annual dividend rate from six to four per cent. This is the lowest rate paid in twenty-nine years. Cash dividends paid by the company from May, 1856, to February, 1921, inclusive, total 408 per cent, and amount to approximately $652,954,752. This is exclusive of twenty-two per cent dividends paid in scrip, the larger part of which were redeemable in stock. Cash dividends since 1847 have averaged 6.01 per cent on par value of the stock. The company has paid a return in every year since incorporation. The highest rate in any year was ten per cent, and the lowest two per cent.

GRAND RAPIDS' TAX RATE

There will be a decrease of twelve cents a thousand in the Grand Rapids city tax rate this year, compared with last year. It was announced that the rate will be $19.89, while in 1920 it was $20.01. The budget calls for a total of $4,158,878, of which $1,849,748 is for city expenses; $1,898,932, school fund; $209,094, mill tax; $121,977, sinking fund, and $79,126, library fund.

HOWELL BUSINESS CONDITIONS

Howell manufacturing plants are transacting a large business in the automotive trade lines. The Spencer-Smith Machine Company is on a 100 per cent basis, with men and space being added. All employes are doing piece work on an eight-hour day basis. The company is making 81 different kinds of automobile pistons. Sizeable orders are coming in from the Reo, Ford, Essex, Dort and Olds companies.

The Howell Electric Motor Company reports a steady gain and is now on a 50 per cent basis, with 150 men on full time. There is a strong demand for the company's polyphase motor and export trade is improving.

Operations will also soon be under way with the Howell Electric Washing Machine Company.

The Nipissing Mines Company has reduced its quarterly dividend rate from 5 per cent to 2 per cent. The former figure has been maintained since 1914.

The American-La France Fire Engine Company has declared an extra dividend of 15 per cent on common stock, payable in 7 per cent cumulative preferred, June 1, to stock of record May 17.

The B. F. Goodrich Rubber Company has decided to pass the payment of the common stock dividend of $1.50 a share, usually payable May 15.

The American Railway Express Company has declared dividends of $2 a share for the last four months of 1920 and $1.50 a share for the first quarter of 1921.

MICH.-COLORADO HEARING MAY 10

Judge Leland W. Carr, of the Ingham circuit court, has fixed May 10 as the date of hearing of the case of the Michigan-Colorado Copper Company against the Michigan Securities Commission to prevent the latter from carrying out an order to show cause why the company's license should not be revoked for selling stock alleged to have been unauthorized for sale. The trial court was set on application of an assistant attorney general. Judge Howard Wiest issued a temporary restraining order against the securities commission last July. Since that time the matter has lain dormant.

NEW UTAH COPPER DIRECTORS

The Utah Copper Company has increased the personnel of its board of directors from fifteen to seventeen by the election of Murray Guggenheim and J. V. Jenkins.

MOTOR PRODUCTS REPORT

President D. B. Lee in his annual report to stockholders of the Motor Products Corporation, says in part:

"The period of readjustment began with us much later than it did with many others, and its full effects were not really felt until November and December, and therefore our operations were on a very satisfactory basis throughout virtually all of the year 1920. Operations during the year 1921 will be greatly curtailed and therefore profits will be correspondingly smaller, but it is felt that the results during the year will show a satisfactory return to the stockholders.

"It was decided in December to pay a dividend of $1.25 a share on the stock on February 21, and at the regular meeting of the board in March a dividend of $1.25 was declared to stockholders of record April 20, 1921, the dividend to be paid on May 1. It is the hope of the board that a dividend of $1.25 a share may be continued quarterly.

"Final adjustment with the Government for taxes due for 1918 and 1919 has not as yet been made. The Government presented a claim for the two years of $439,762.04, but a claim in abatement was filed with the Treasury Department and it is the hope of not only the directors but our auditors as well that the sum is excessive and therefore cannot be sustained, and that it will be greatly reduced, although no positive assurance can be given as to this."

The statement is noteworthy in that there are no current liabilities except $464,785.55. Accounts payable and quick assets total almost $6,000,000, included in which is $2,800,000 U. S. certificates of indebtedness and $411,340.39 cash. The comparative balance sheet below also shows the extraordinarily secure position of the stockholders and the improvements over the condition of the corporation at the close of business on December 31, 1919, a year previous.

CLAYTON & LAMBERT

Stockholders of the Clayton & Lambert Manufacturing Company, Detroit, meeting in special session late last week, authorized the officers and directors to take the necessary steps to increase the capital stock from $1,000,000 to $1,500,000 to provide for the company's expanding business. It has been necessary to increase the capital twice during the last year. A larger factory recently has been completed at Knodell avenue and the Detroit Terminal Railroad.

THE OLDEST HOUSE IN MICHIGAN

THERE is a reason for the present widespread interest in FOREIGN GOVERNMENT BONDS—many investors are realizing that it is an exceptional opportunity to buy safety together with high income and good possibility of profit. We suggest that you investigate their suitability to your requirements.

G. E. CAPITAL INCREASE

Stockholders of the General Electric Company, meeting May 10, will vote, it is reported, on a proposal to increase the capital stock from $175,000,000 to $185,000,000.

WEATHERPROOF BODY RECEIVERSHIP

Judge Arthur J. Tuttle, of the United States District Court at Detroit, has appointed the Security Trust Company, Detroit, receiver for the Detroit Weatherproof Body Company, Pontiac. The action was taken on application of the Michigan Steel & Metal Company, in which petition the body company joined. The petition set up that the body concern was indebted to the petitioner in the sum of $600,000, and that while its assets exceeded that amount considerably, they could not be realized on except at a loss.

Public Utilities

Grand Rapids—On May 1 a reduced wage scale for employes of the Grand Rapids Railway Company went into effect, the reduction being 10 per cent. The new scale is as follows: Motormen, conductors and motor inspectors, 46 cents an hour for the first three months; 48 cents for the next nine months, and for the second year and thereafter, 50 cents an hour. Five cents an hour will be added for operators of one-man cars. The schedule will be in effect for six months. The old pay schedule called for 56, 58 and 60 cents pay an hour.

Ann Arbor—Appraisal of the properties of the Detroit United Railway has been made by Prof. Henry T. Adams, of the Engineering Department of the University of Michigan. It places the value at $61,203,987. The physical value of all properties is scheduled at $56,757,875, of which $33,296,144 is credited to the Detroit properties. The value of the D. U. R. franchise in Detroit is set at $81,051 and the outside franchise values at $4,446,112. The appraisal was based on a total mileage of 718.69 miles, of which 307.76 miles are in Detroit.

Owosso—Seth J. Pulvar and C. D. Bell, Owosso, and Walter M. Bush, Corunna, have purchased the stock of the Owosso Gas Company from the Dean family, Ann Arbor.

Ravenna—The Ravenna-Conklin Light & Power Company has been organized here to provide electric power and light for this village and Conklin. A dam in Crockery creek will be constructed and a power house erected.

Owosso—Stockholders of the Union Telephone Company, meeting here a few days ago, re-elected the board of directors. W. J. Melchers was named to succeed the late E. O. Dewey.

Detroit—The Detroit City Gas Company has filed with the city controller a statement showing a deficit of $101,965.01 for the month of March and a shortage of $338,372.24 for the first quarter of the year. The statements are being filed in pursuance of the agreement reached when the recent rate increase was allowed.

New Publications

"C-H IRON-CLAD SOLENOIDS"

"C-H Iron-Clad Solenoids" is the title of a new four-page, 8½ by 11 leaflet being distributed by the Cutler-Hammer Manufacturing Company, Milwaukee, Wis., and describing electric solenoids for operating brakes, clutches, valves and similar devices where a straight line motion is desired.

These solenoids, it is stated, are weather proof and the usual hammer blow and noise accompanying the operation are largely eliminated by the use of a floating plug, which the plunger engages at the end of its stroke. The plug also provides a high pull and a fixed position for the plunger when sealed. An equaliser bushing prevents excessive side pull on the plunger. The solenoids are furnished in four sizes, the maximum gross pull of the largest size being 400 pounds.

FOUNDRY PRACTICE HANDBOOK

The Farrell-Cheek Steel Foundry Company, Sandusky, Ohio, has just issued one of the most complete handbooks on foundry practice that has come to our attention. It not only describes but illustrates profusely each operation required in making of a casting, the same casting or pattern being used throughout.

The booklet is printed in four colors.

U. of D. Takes Lead In Aero Education

(*Continued from Page 8*)

airways and is forty miles wide and all cities and communities within the belt are considered on the air route. The same applies to airways. Detroit is between the Wilson and Chanute and Bell airways, but touched by neither, and is on the Detroit-Montreal air route. The airways and their terminals are as follows:

Transcontinental-Wilson Airway, New York to San Francisco; Wright Brothers Airway, Washington to San Diego; Langley Airway, Philadelphia to Santa Barbara; Chanute and Bell Airway, Boston to Seattle, Wash., and Portland, Ore.; Rodgers Airway, Newport News and Norfolk, Va., to Los Angeles.

Costal-Atlantic Airway, Bangor, Me., to Key West, Fla.; Gulf Airway, Key West to the mouth of the Rio Grande; Pacific Airway, San Diego to Puget Sound.

The air routes so far established are from Chicago to New Orleans; New York to New Orleans; Louisville-Charleston-Washington; Charlotte-Raleigh-Norfolk; St. Louis-Southwestern; Galveston to Dallas; Winnipeg to Louisiana; Key West to Havana.

If one point of a pair of compasses were set at Detroit and the distance from Detroit to New York (six hours' flying time) were used as the radius and a complete circle drawn on a map of the United States, the circle would entirely include or touch nineteen states and, roughly speaking, more than seventy-five of the best known commercial and industrial cities in

7% and Dynamic Detroit

Detroit investors have outgrown the 6% idea. 7% is now demanded—and with it the same safety as in the days of 6%. To meet this demand we offer our 6% First Mortgage Bonds on a basis to net 7%. You cannot buy a safer bond. Our booklet, "Dynamic Detroit," explains in detail the issues we offer on a 7% basis. Send for it. It shows how you can obtain the most liberal interest rate ever offered by a local Mortgage Corporation of our magnitude.

the country. In other words, no city in the United States is so advantageously located for aeronautical development as Detroit. The same circle described on any other part of the map would not show anywhere nearly the same number of cities of equal importance.

Detroit as the Center

Probably Dayton, more than any other one city, can be said to be the present aeronautical center of the United States because of the location there of McCook field, the Government's major aviation and aeronautical post. It is understood, however, that this station is to be moved elsewhere, the location to be decided this summer.

If some city is due to be the future aeronautical center, as Detroit was destined to be the automotive center, then Detroit has as good a chance as any other city, and many advantages other cities cannot show.

Detroit has been accused of being the least progressive in the most progressive science in the world. What interest there has been in aeronautics has been of a social and sporting nature. Dean Dunn of the University of Detroit points out that the city has no aerial mail service, which, for a city of a million people, is "incomprehensible." Cleveland has such service, with the result that mail is from ten to twenty hours later in Detroit than in Cleveland. Dean Dunn says:

"The speed with which mail is carried and the celerity with which it is delivered often means a great deal to competitive industrial and commercial organizations. The success of a big business deal may rest upon a few ticks of the clock. In dealing with foreign countries the speed of the mail service cannot be underestimated in importance. Detroit, and Michigan for that matter, with its great industrial organizations doing business in millions, should have air mail service of the best.

"The location of present landing fields—the Packard field and the proposed Russel field out Grand River—constitutes a drawback to aerial navigation. Both are too far from the center of the city. The time saving made by air travel is lost by the travel time necessary after the ship has landed. The ideal location for a municipal aviation field is Memorial Park, East Jefferson avenue, opposite Belle Isle. Undoubtedly the future commercial planes and airships will be amphibian. This field is on the bank of the Detroit river, and a body of water is the best and safest landing place.

"Aerial transportation to be really valuable must be unlimited by seasons. That means that field facilities must be suitable for all seasons. In the winter months the ice on the river, assuming it freezes hard enough, provides an ideal take-off and landing place.

Civic Interest Lacking

"A third element lacking in Detroit is civic interest in flying from the standpoint of its value in the development of the city. Less pardonable is the failure of the industrial and commercial interests to see wherein aeronautics holds much in store for them. The use of aircraft means the manufacture of aircraft and equipment. Why should Detroit look to other cities and even other countries for such equipment. I sometimes think Detroit is automobile-blind. It is an automotive city, but the disadvantage of being a one-industry town must be patent to all after this depressing period. Just as automotive manufacture has contributed its experience and brains to aeronautical science, so will this science, as it progresses, contribute to automotive development.

"There are any number of principles embodied in the construction of aircraft that can be applied to the improvement of motor vehicles. Take just one factor—weight. The effort has been to make aircraft as light as possible without the sacrifice of strength. This is essential in a machine traveling the air, but it is likewise important in the construction of land vehicles.

"While it may be necessary to mix the bitter

with the sweet, I prefer to talk about what Detroit has that can make her a great aeronautical center. Looking over her industrial plants we find facilities for making wheels, carburetors, magnetoes, wire, metal products, propellers, motors, instruments and other equipment for air machines. Further, Detroit knows how to produce in quantity. The Packard company made engines and aircraft. The Fisher Body Corporation made aircraft. The Lincoln Motor made engines. The Flotorp Company, Grand Rapids, makes propellers. William B. Stout is making aircraft.

"All this is recognized and is very well, some will say, but why organize for an industry still undeveloped? That is where the nut should be cracked. Before you can establish an industry you must create a demand for product, and this creation presumes expressing an interest and indicating a confidence in the practicability of a product.

"What more proof do we need than the accomplishments of the war, the air mail service now in operation, the freight and passenger-carrying enterprises established in various parts of this country, and the strides made by Europe? Europe is ahead of us just now, but Europe has neither the facilities nor the finances to keep ahead of us once we get started. I believe that aeronautics have made faster progress in the last five years than the automotive business has in twenty-five years. Industrially and commercially aeronautics will keep on traveling at that rate."

Bearing out Mr. Dunn's contention is the report from England that a new type of air-water-land-submarine vehicle has been successfully tested. It is called the "Tessaurian." This remarkable machine flies in the air, travels on land and sails on and under the water. Its double planes telescope for under-water travel. Its motive power is gasoline and electricity. It has a keel like a boat, which is that draw up into the body, a periscope, air chambers and machine gun pit. This machine, it is claimed, can be made large enough to carry torpedoes. It is a war machine, of course, but what machine has been developed in the automotive world that can equal it?

Uniform U. S. Laws Needed

"To give aeronautics an impetus we need uniform federal laws," said Mr. Dunn. "Existings laws, particularly those passed by states, should be federalized. When the proper regulation has been accomplished then both the commercial fliers and air transportation companies will know how to proceed with their work. Bills are pending now; in fact the University of Detroit has been entrusted with the responsibility of preparing and presenting such legislative measures as seem to be called for, and we are at work upon them now."

In the daily papers last week there was an account of a $50,000,000 airship corporation being organized in Washington to construct and operate rigid type airships for transcontinental and trans-oceanic passenger travel. The article reported that the first ships for this company were being built in Europe. The inference to be drawn is that these ships could not be built in the United States or if they could be built here, the cost would be greater than in Europe. Europe has not beaten Detroit in the construction of automobiles and there is little likelihood that Europe ever will. The first ship ordered by the corporation is to be 752 feet long, 96 feet in diameter, have a gas capacity of 3,355,000 cubic feet of gas, 2,000 horse-power engines, speed of 80 to 100 miles an hour, 50-ton lifting capacity, 52-passenger capacity and 10,000-mile cruising radius.

The company's announcement of its plans includes the statement that inasmuch as airships will be of prime importance in future wars and countries must continue to develop them, therefore the best way to develop aircraft is to put them to peace-time uses. In other words, why not derive a peace-time benefit from war-time preparations.

Four Chief Problems Confronting America

(*Continued from Page 10*)

of fair and considerate and broad-gauged dealing.

We are all beneficiaries of one another's prosperity, and it hardly needs arguing to prove that it is in the best interest of the employer, even from the merely selfish point of view, not to pay the lowest wages to which labor can be squeezed down, but rather the highest wages compatible with the successful conduct of his business and with keeping his product at reasonable cost.

By the same token it is in the interest of the worker to be an efficient producer and not to slacken on the job. As the distinguished economist, Mr. Hartley Withers, in his book, "The Case of Capitalism," has well said: "The wage earner is most likely to earn good wages when there are as many capitalists as possible putting new capital into industry and competing for the services of the wage earner as a worker and for his custom as a consumer. If labor prefers to frighten and threaten the capitalist, the latter will be scarce and shy and his capital will be scarce and dear."

In the same book the author proves interestingly, in contradiction to the widely prevalent belief among employes that an undue share of the fruit of their labor is appropriated by the employer, that, as a matter of fact, labor gets the whole value of its actual product and, indeed, more. He adds: "If it wants to get also the share of the capitalist and the adventurer it can do so by saving capital for itself and risking it in industry, thus becoming its own employer and provider. A few shillings per head from the working class would quickly raise the necessary capital to make a trial of democratic management in any industry."

The labor unions in this country claim a membership of 4,500,000. If every member laid aside $1 each week, the available sum at the end of one year would amount to $234,000,000. That is a pretty tidy fund to start business with, in various lines. Personally, I should be glad to see the experiment tried and should welcome its success. The more workingmen come into direct contact with, and acquire direct knowledge of, the realities, the complexities, cares and risks of business conduct, the better it will be for all concerned.

I will refer in only a few words to the gratifying and reassuring fact that, notwithstanding insistent urgings on the part of agitators, American workmen do not carry class consciousness into politics. A conspicuous demonstration of this truth was given in the last presidential election when, although the leading spokesmen of organized labor took active and vigorous part in opposing the Republican candidate and party, every industrial state in the Union gave very large Republican majorities, which of course would have been impossible if there had been such a thing as a compact labor vote.

The American workman votes as a citizen, not as a member of a separate class, a fact too often forgotten by politicians. Perhaps it is too often forgotten also by employers. If we want the workman to continue to vote from the broad point of view of a citizen, we must be regardful of his self-respect and strengthen his faith in, and adherence to, our social and governmental system, and treat him as a fellow-citizen always, and not merely during electoral campaigns.

The Situation in Europe

Our position as regards Europe reminds me very much of a story told during the war: A small patrol had been sent forward, and after a few minutes those left behind heard a voice calling back, "Sergeant, I have made a prisoner!" The sergeant shouted, "Well, bring of him in!" and the voice came back, "But he won't let go!"

Europe "won't let go." Even if President Wilson had not committed the fatal mistake of walking personally into Europe's parlor in Paris, even if the peace treaty had not been so framed with deliberate cunning as to make complete disentanglement for us a matter of

(*No. 7 of a Series of Examples*)

Is a Corporation Liable, If its Officers, Though Innocently Deceived, Transfer Stock Upon a Forged Power of Attorney?

Yes. The rule has been stated as follows: ". . . A corporation whose officers, although innocently deceived by a forged power of attorney, permit shares of stock to be transferred on the books without authority from the shareholder, may be compelled to replace them or pay him the value of them. Upon the stock so issued by wrong or mistake the corporation is liable to a bona fide holder thereof.

Our Transfer Department realizes the necessity of constant vigilance in the transfer of stock, with the purpose of assisting in the correction of an innocent mistake or irregularity to expedite the transfer or to prevent the transfer if any question of apparent fraud is involved.

We will be glad to discuss with you the character and details of the service we render our customers in this department.

THE NATIONAL PARK BANK OF NEW YORK

214 Broadway

A BANK that shares with its friends the information and experience gained from 65 years of close contact with the commercial, industrial and financial life of the nation.

Established 1856

Safe Deposit Vaults

practical impossibility, we still could not wash our hands of Europe.

As one who from the very first has stood with the "irreconcilables" on the subject of that ill-designed and insincere contrivance, the miscalled and misshapen League of Nations, and who considers the Versailles treaty as unique among instruments of its kind for faultiness and harmful consequences, I am yet bound to submit to the compelling logic of existing facts. The European situation at present is a major element in our own affairs.

Whatever stimulates Europe's consuming capacity, whatever tends to re-establish order, normal conditions of trade and productivity, is of interest and advantage to us. Whatever is calculated to retard Europe's recovery is of distinct detriment to us and reacts upon our own prosperity.

Whether we like it or not, we must take part in world economics. We must join in efforts to bring about genuine settlement and appeasement of the world, lamentably and culpably delayed hitherto. Not seeking any exclusive advantage for ourselves, and therefore unhindred by selfishness, deriving our compensation out of the results flowing from the enhanced well-being of all nations, we are peculiarly qualified to illumine the murky gloom of post-bellum and post-treaty Europe with the clear rays of well-meant, judicious counsel.

We cannot avoid taking within our purview that sinister legacy of the Versailles treaty, the reparation question.

There is no limit to the amount which justice and the moral sentiment of the world would exact from Germany by way of reparation for the devil's visitation which she unbosomed upon the earth. But there is a limit, of course, as the Allies have recognized, to the amount which it is possible to collect from Germany in gold marks or their equivalent; and still more, as has not perhaps been sufficiently recognized, there exists a very distinct limitation as to the kind of economic values in which the Allied nations would be willing and could afford to accept payment.

What, then, is the answer to the problem? Is Germany to escape adequate atonement? Is France to be left to carry the staggering economic burden resulting from a war wickedly and wantonly forced upon her, in addition to the appalling suffering, sorrows and sacrifices which she has borne with such sublime heroism in defense of her soil and of liberty, justice and humanity? That is unthinkable and revolting to every instinct of right.

The Answer

It is difficult to make a categorical answer, fully covering the question, but it seems to me that part of the answer is:

Germany must go, or must be made to go, to the limit of her capacity and of hearable conditions to make reparation in a way acceptable to the Allies. A considerable amount of economic values can be obtained from her in ways which her creditors can afford to take. A very large additional amount can be secured through the enforced or voluntary imposition of export or import duties, and similar devices, but it must be borne in mind that that method involves one of two consequences: Either the foreign buyers of German goods bear part of that burden through enhanced prices (and I feel that the Allies, especially France, have a morally warranted right to expect from the rest of the world that it will, within reason, acquiesce in that) or there will result a gradual shrinking of German trade, which means that the security of the Allied creditors becomes decreased in value and productivity.

Another part of the answer should be, I believe, recognition on our part that we cannot afford to refrain from playing a practically helpful part in the settlement. We cannot afford to refrain, because we cannot be callously heedless to the call of justice and of sentiment toward France and also because our material interest is directly involved. Our export trade requires the restoration of normal conditions in Europe, and that consummation is impossible of attainment so long as the reparation question remains an open sore between France and Germany. The repercussions of that condition are bound to be felt throughout continental Europe, and more especially and acutely throughout Europe east of the Rhine.

The conclusion seems to me unescapable that we must enter into the situation both with counsel and with that financial co-operation which only we are in a position to give and which we can give with perfect safety.

More or less related to that subject is the matter of the indebtedness of the Allied nations to our government, arising out of the war and amounting to $10,000,000,000.

I am not one of those who approach the matter of that debt with a feeling of apologetic diffidence. It is justly due us. It is not a justified contention that our loans should naturally be considered and treated as a contribution to the common expense of the war. The circumstances and motives of our entrance into the war are essentially different from those which affected most of the Allied nations when they unsheathed the sword. They were compelled to fight either in self-defense or to protect momentous national interests which would have been vitally jeopardized in case of a German victory.

America, on the other hand, went into the war wholly of her own free will. Neither any fear of the intention or actions toward us of a Germany emerging from the war unwhipped, nor any hope of or desire for gain actuated our decision to throw the American sword into the scale on the side of the Allies.

America was uninfluenced by any material or political consideration. She fought because

Digitized by Google

her dignity had been flouted, her flag defied and her government treated with contumely, but above all—consciously, deliberately, with a full realization of the cost involved in lives and treasure—because her many-rooted people had become finally (even though tardily) convinced that the cause of the Allies was that of right and liberty struggling against the brutal might of a lawbreaking, treaty-defying international bully, and because they felt that in such a cause her place was not in the camp of safe and profitable neutrality, but on the battlefields by the side of the champions of freedom and justice. As Prof. Pani L. White, of Yale University has well expressed it: "Our declaration of war marked the triumph of justice over expediency."

Furthermore, there is this essential point of differentiation between us and the Allies, that each of them took material compensation from the vanquished, to the extent that there were assets to distribute (not to mention advantage of a less tangible but none the less real nature) while America asked nothing and received nothing of the material spoils of war nor obtained any other benefits. We are carrying the immense burden of our war expenditures without compensating tangible return. Indeed, in certain respects, the status resulting from the post-helium settlement may be said to be rather unsubservient to our interests than otherwise.

These are perfectly valid considerations and their assertion is entirely compatible with the warmest admiration for the heroism of the Allied nations, with the sincerest friendship for them and with the altruistic motives which actuated us in entering the war.

But it remains equally true, on the other hand, that we are unquestionably called upon to take fully into account the circumstances under, and the purposes for which these loans were contracted, the existing abnormal state of the exchanges and the difficulties of the economic problems which confront our Allied friends.

I do not mean to put Germany's debt to the Allies and especially to France on the same footing as the Allied debts to us. There enters into the claim of France against Germany a moral element which far supasses any merely legal right. The conscience of the world will not be satisfied until Germany will have made to France at least that degree of material reparation, inadequate though it must be at best, which by her utmost practicable efforts she is able to produce.

Yet, to an extent, all these problems of debts arising from the war are inter-related. Situated as we are, it is our duty, as it is our self-interest, to deal with them on broad, far-sighted and liberally constructive lines.

The debts of the Allied nations to us are no ordinary commercial debts, and they cannot be treated as if they were. To the extent that we use them, or part of them, to aid effectively in hastening the re-establishment of economic equilibrium and political settlement in Europe, they will have proved a good investment, both actually and morally. And we shall be all the more justified in insisting that in the treatment and settlement of various questions which are now pending or will come up for discussion, as to matters arising from the world-adjustment following the war, our rights shall be respected and the spirit of large-minded fairness shall be dominant.

NASH OUTPUT GROWING

The April production schedule of Nash Motors was 3,211 automobiles, as against 2,081 for March, according to a statement issued by Charles H. Voorhis, vice-president and sales manager.

MORE COPPER FOR GERMANY

Another 2,000,000 pounds of copper have been sold to Germany by the Calumet & Hecla Mining Company. This makes 4,000,000 pounds purchased by Germany within the last month.

METALLURGISTS—

Rotary Continuous Heat-Treating Furnaces Used in Quantity Production of Pressed Steel Parts.

The following advantages are secured by the Continuous Method of Heat-Treatment:

Bringing material up gradually to the final temperature.

Utilizing heat in spent gases to pre-heat material.

Exposing each piece to heat in same manner, to same temperature, for same length of time.

Uniformity not only of the individual piece but of the sections thereof as compared with the corresponding sections of other pieces.

Do these advantages appeal to you?

Write nearest branch for Bulletin 237-B and learn whether the continuous method is adaptable to your product and manufacturing conditions.

A Letter From a Banker

To the Financial Editor:

We are confronted with a condition that is far from satisfactory and are taking the liberty of writing you for some good advice, knowing that you are familiar with banking conditions both from the standpoint of city and country.

For the last ten or twelve years this bank has had as its active Detroit correspondent a certain bank, sending and receiving the daily cash letters, etc., but notice of late that they have discontinued this and are apparently handling all our items through the Federal Reserve Bank. We are not members of the system and the other bank of this village is, therefore it is securing about 80 per cent of the items. We are writing the Detroit bank for an explanation and would like your advice as to whether or not it is advisable for us to become members of the Federal Reserve System, stay with our Detroit bank or make a new Detroit connection. H.

The situation in which your bank finds itself is one which many other banks of recent years have encountered. It brings to mind first this thought which is often overlooked: State banks in a sense are "orphans" so far as any connection with the currency issuing powers of the Government are concerned, and we often wonder if many people think much about the position state banks would be in if national banks and Federal Reserve Banks ever refused currency to state banks. Manifestly all states would have to go back to that condition of affairs preceding the national bank act, when each issued its own currency and when there were as many different values of currency as there were issuing banks. But of course no one entertains any such reversal of progress.

When the national banking act was created state bank notes were taken out of existence and since then many states have passed laws prohibiting state bank currency. When the Federal Reserve Act was adopted there became two sources of currency issue, namely the national bank statute providing for national bank notes, and the Federal Reserve currency. But the biggest change the Federal Reserve Act achieved was to provide that state banks through membership in the System could obtain currency from the issuing source, i. e., the Government. Since state banks are not permitted to issue currency hearing the name of the issuing bank, they were enabled by joining the system to obtain government money to all practical purposes in much the same way as national banks.

It was found in 1883 and 1907 that the currency issuing machinery of the national banks was not elastic enough to provide for the needs of the country, and without going into details, in the main, the Federal Reserve System was erected to overcome this glaring weakness and to provide a storehouse in which the banks of the country could deposit their "reserves" and know that such fund would always be available. So no doubt realize that if you now keep, say, $30,000 on deposit with your correspondent which you look upon as your "reserve," that less than five per cent of that sum is held in money in the correspondent's vault and probably not more than ten per cent of it is kept in form of bank deposits, so, that, all told, there is really only $1,500 in money and $3,000 in other banks behind your $30,000.

Now contrast this with the actual reserve behind $30,000 deposited in the Federal Reserve Bank in this case there Is not less than 35 per cent of gold behind your reserve and there is the power and the machinery to loan the remaining 65 per cent to you in currency if the emergency requires it. In fact there is much similarity between the state bank that stays out of the System and the farmer who does not plant his own potatoes. There may be a long period of years when he can purchase the surplus potatoes of his neighbor, but should there be a serious shortage he would be up against it. Thus non-member banks very probably will get along for a considerable time, but a crisis is bound to come eventually which will put them at a serious disadvantage.

We have constantly held to the opinion that every eligible state bank would profit in the long run by membership. The par collection matter is somewhat like the prohibition question. There is a vigorous minority in favor, another equally vigorous and outraged minority against, but the large bulk are apathetic. And neither question will be permanently settled until the large bulk take action one way or another.

Looking at it another way, we feel that loss of exchange profits is a small price for the security which membership affords state banks, and if there were space we could go into the pros and cons and find some very interesting light on this whole subject of membership. But the big distinguishing advantage to our mind is that membership gives the small country bank the same degree of protection, the same degree of currency and rediscount privileges and the same prestige that it gives the big city bank. And there is one price to all.

You may, furthermore, we believe, have every confidence in your present correspondent. P. S. H.

UTAH COPPER EARNS $3.03

Utah Copper Company reports earnings of $4,924,498 for 1920 after deduction of charges and ordinary taxes, this being equal to $3.03 a share on the $16,244,900 of capital stock, par value, $10, as compared with $5.08 a share in 1919.

"THE RAMP TEST." In order to test the Duplex Compensating Suspension, this spectacular test was devised, a ramp of 12½% grade was erected and a tractor was sent down against the bumping post, striking it with an impact of 4½ tons. Only the bumping post was damaged.

Tons-per-man-per-hour

MANUFACTURING in a highly competitive market is a continuous fight to prevent unproductive costs from swallowing up profits. The mere handling and re-handling of raw materials, parts and finished products may be a hidden leak which is actually draining either sales or profits from your company.

The unit in measuring material-handling is tons-per-man-per-hour.

It is the job and responsibility of a Baker material-handling engineer to investigate the possibilities and processes in your plant and report frankly and thoroughly what savings in tons-per-man-per-hour can be effected by the new Series C Baker Electric Tractors and Trucks to show what handlings can be eliminated by the right equipment and how your material-handling can best be organized and standardized. If the Baker method won't fit your particular plant, he will frankly tell you so. The request for a visit does not place you under any later obligation.

The New Series C with its exclusive new Duplex Compensating Suspension — results in seven specific improvements —which set wholly new standards in adaptability, ease of operation, economy of operation and lasting value.

New bulletins now ready—yours on request.

A Symposium on World Trade

A Digest of the Discussions at Eighth Convention of National Foreign Trade Council, in Cleveland

IT SEEMS TO BE the general opinion in financial and industrial circles that when the German reparations have been definitely agreed upon by the nations concerned the whole world will settle down seriously to commerce and industry with some idea of what its tasks are and how best to proceed with their accomplishment. Germany has sought by all her well known wiles and subleties to evade the payment of as large a portion of the claims against her as possible, but France has clung tenaciously to what she conceives to be her rights. It is as important to the United States that these reparations be decided upon as expeditiously as possible as it is to the nations directly concerned. Therefore it is not surprising that President Harding has decided to take an active part in the reparation deliberations, and this action promises a speedy settlement of the differences and the removal of this obstructional problem from the pathway of world progress.

When these reparations have been agreed upon, the nations engaged in world trade prior to the war will proceed energetically to recover lost ground. Even though the sporadic quarrels in Europe and the refusal of Germany to meet her obligations have kept the atmosphere surcharged with uncertainty, Germany, France, England, Belgium, Japan, Spain, Portugal and other nations with goods to sell have been working diligently and untiringly to establish their trade connections against the day that the aftermaths of war are disposed of and actual or imaginary restrictions cancelled.

Convention at an Opportune Time

Since long before she entered the war the United States has had the trade lanes of the world pretty much to herself and the ever-existent problems of foreign trade have mattered little one way or the other. The take-it-or-leave-it rules, which obtained in domestic commerce, likewise held sway in foreign trade. Hereafter, the United States will face competition with a capital C. Germany will be struggling to pay her debts; England will be strengthening her position as mistress of the seas; France will be rebuilding her shattered domains and her overworked credit, and the rest of the world will be seeking a better seat in the orchestra pit of world recognition.

All these facts were recognized when the manufacturers, exporters, financiers and business men of this country when the eighth annual convention of the National Foreign Trade Council was convened in Cleveland, May 4, 5, 6, and 7. The convention could not have been called at a more opportune time, nor could a more difficult task have been set before any national body than that of mapping out a foreign trade program pertinent to the situation and this important period in world's history.

By F. W. HERSEY

No man in this country, nor from other nations, was too big to take his part in this meeting, and the best commercial, industrial and financial minds were among the 2,000 delegates. From the greatest financier in the United States down to the humblest wage worker, this convention was of the utmost importance to every American. The weaknesses in our foreign trade policy and machinery have been recognized and they are causing no small concern. Also, manufacturers who in the past have not considered export in their scheme of things are thinking of it today as the one possible chance for advancement in business progress where all other opportunities seem to have been used up.

The convention had before it the problems of taxation, shipping, Government aid, markets, credits, financing, shipping laws, education in foreign trade, trade balance and economy. Out of the mass of material produced in the four days of speaking and conferences the convention was duly bound to build a program to meet the new conditions.

The Findings

The first and important finding of the convention was that the unstable financial condition of the world was the cause of the business depression in the United States, and that the desired relief must come from an improvement in overseas trade, which, from $928,000,000 in June, 1920, had dropped to $384,000,000 in March, 1921.

The United States must, it was declared, continue to import raw materials and merchandise to an extent just removed from a degree that would be detrimental to domestic industry; in other words, imports must reach a maximum, but not cross the dead line at which our own industrial genius would be menaced. This must be done to make it possible to promote the liquidation of the debts of competing nations, on the one hand, and keep home labor employed on the other.

To accomplish this it will be necessary to provide facilities for long term credits and to draw upon surplus American investment funds to make these credits possible. Europe cannot buy in gold or merchandise but it needs raw materials.

The convention urged the creation of financial institutions under the Edge Law to promote a free exchange of imports and exports and provide the long-term credits. The purchase of debentures issued by such institutions against approved foreign securities was urged, so that eventually every community would serve its own vital interests by furthering foreign commerce.

It was declared that the reduction of loans and the accumulation of banking reserves permitted, and the lower prices of many commodities justified extension of credits, which, it was believed, would thaw frozen credits and end the present stagnation. The danger of a financial panic was over, the convention decided, and was aided in reaching this decision by W. P. G. Harding, governor of the Federal Reserve Board, who covered the general financial situation completely and clearly.

The special committee reporting the findings of the convention at the closing session, Saturday, urged against hasty or ill-advised expansion of industrial facilities for the reason that the final liquidation would take months and must continue to be a gradual process borne with patience and studied carefully. It was asserted that the cost of production of many manufactured products was too high to permit of successful competition in foreign markets, and, inasmuch as the cost of living had receded, there should be economies in production to the end that the balance of values of all commodities might be stabilized. A reduction in the cost of railroad transportation, both in domestic and foreign commerce, was regarded as essential before any marked decrease in production costs could be achieved.

While Congress has declared for private ownership of the merchant marine, the convention considered it unwise and impracticable to dispose of any considerable proportion of the present government-owned fleet to private owners at fair prices. Those boats not chartered on bare boat basis or under charter to private operators should be laid up pending renewal of world commerce, thereby providing a naval auxiliary. The convention opposed the allocation of ships to be loaded at ports or for trade routes irrespective of tonnage of cargo offering or of the losses to the Government resulting from this policy.

Training for Foreign Service

It was asserted that the present shipping laws requiring larger crews subjected American vessels to a disadvantage estimated at five per cent on the capital invested, and the compulsory advance of half the wages in any foreign port of call added further costs through excessive delays. The convention urged American producers and exporters to require the employment of American ships as far as they could exercise preference or control, and to object to discrimination against American ships. Combined passenger and freight service between the United States and its possessions, and other ports, was declared to be imperative.

The multi-conformity of state and federal laws and excessive taxation were considered evils which placed American insurance at a disadvantage with the foreign insurance market in which they must compete. As regards taxation, the stand taken was that there must be economy in government expenditures so that the multiplication of taxation would not continue to oppress business.

Because of the many violations of awards through commercial arbitration and the viola-

Digitized by Google

tion of contracts, the convention went on record as favoring the establishment of international machinery for the enforcement of awards and contracts. Along the same line the convention took due note of the complaints against the present foreign service organization and declared that reorganization of this service under unified supervision was highly desirable. Better trained men and higher salaries were considered essential, and to the end that such men might be attracted to this service as a career the Government was urged to establish a national training academy for foreign trade officials and attaches.

Congress was requested to act with celerity on increases in the appropriations for the Bureau of Foreign and Domestic Commerce and the Bureau of Standards. The enactment into law of the China Trade Act, which will permit the formation of American companies in trade in China on a plane of tax equity with competitors, was urged.

Regarding the ship situation Senator Walter E. Edge, New Jersey, author of the Edge Law, said that the United States would do well to save thirty-five per cent of the billions of dollars spent on ships. A large proportion of them were valueless even as barges. Another shot was fired at the United States Shipping Board's policy by James A. Farrell, head of the United States Steel Corporation and chairman of the convention, when he said that the Government lost $800,000,000 in selling the merchant marine when the Armistice was signed. He said that the idle tonnage would not be absorbed under three years. Of the 60,000,000 tons of world shipping, 7,000,000 tons is now laid up and 5,000,000 tons are under construction, he explained. The policy of the shipping board in attempting to establish trade routes from every Atlantic, Pacific and Gulf port to every port in the world was too expensive and impracticable.

Other Matters Discussed

Edward N. Hurley, formerly the head of the United States Shipping Board, was on the program. He said that Congress would render the country a great service it if caused to be made a survey of jobbers and dealers through out the United States. He declared the costs to distribution to be entirely too high and advocated the federal incorporation of American firms in business in foreign countries.

William C. Redfield, former Secretary of Commerce, regretted the slow progress made in financing the United States Foreign Trade Financing Corporation, which, he said, should be operating now in view of the fact that $20,000,000 worth of orders from foreign countries could be closed immediately.

In connection with the convention the announcement from Washington that applications for loans totaling $11,035,000 for financing exports have been approved by the War Finance Corporation, will be of interest. Of this amount $2,306,798 has been advanced and $8,500,000 has been asked to finance the export of milk products, this being the heaviest loan sought. Cotton was the next heaviest, $2,505,000, and the rest was for tobacco exports. The countries to which these exports are to be sent are England, France, Italy, Portugal, Japan, Germany, Czecho-Slovakia, Denmark and several South American countries.

Of considerable interest was the statement of Dr. Francis M. Boteiho, Japanese writer, to the effect that foreign trade development was the surest safeguard against war with Japan.

Practically every problem in foreign trade was given a thorough airing by men competent to speak with authority on such subjects.

Some time ago the Detroit Board of Commerce was asked and did take a definite stand in favor of a reduction or elimination of income taxes on American concerns doing business in foreign countries. This action is nation-wide. One angle of this question was brought in the convention by Daniel R. Williams, American Chamber of Commerce, Manila, P. I., who said that in the Philippines as well as everywhere else outside of the United States, the burden of income taxes was creating an unequal battle between the United States and competing countries in foreign trade, with the odds against American business. In support of his contention, and as an illustration of the inequality of taxation, the following figures are given:

Income	Philippine Income Tax	United States Income Tax	Difference Against Americans
$ 10,000	235	$ 80	$ 155
25,000	810	540	1,270
50,000	2,535	9,190	6,655
100,000	8,985	21,180	12,195
200,000	18,235	82,180	63,945
300,000	31,735	184,180	152,445
400,000	46,235	282,180	235,945
500,000	60,735	382,180	321,445
600,000	77,735	372,180	297,445

Exporters' Problems Classified

Foreign trade problems of American exporters, as classified by Frank H. Taylor, president of the S. H. Dental Manufacturing company, are six in number: Language, travel, exchange, extended credits, balance of trade, and war. Mr. Taylor touched briefly upon each problem, but by incorporating under each head the high lights in the addresses of other speakers bearing upon each of the problems, the current opintons of export students as expressed in the convention may be the more easily digested.

Mr. Taylor divided American exporters in two merchandising classes. First: Bulk merchandise, such as foodstuffs, coal, copper, steel, cotton, raw materials generally, goods manufactured under specifications for contract or otherwise, representing a class of exports in direct competition with foreign products where the controlling influence in their sale, in the absence of banking affiliations, is price Second: A class of products which spring from some characteristic genius in the American people and which sell on their individual merits, with the element of price competition more or less secondary. In this class are such products as agricultural machinery and tools, locomotives and certain types of motor cars, machine tools and labor-saving devices, textiles and sewing machines, typewriters and calculating machines, printing and composing machines, padlocks and pens, boots and shoes. Mr. Taylor put stress upon the exporters' problems as applied to this second group. The first problem he discussed was that of language. His thought was: "We cannot know people unless we can talk to them and talk to them precisely." He quoted an extract from a letter from an American in Italy who spoke Italian fluently, and who was endeavoring to master French. In reply to a request that he represent a concern in France as well as Italy, he said that he could not do so successfully, as it was necessary for a trade representative in France or Belgium to speak French like a native, and although he had been studying the language a year, he did not feel competent to handle it.

Prof. J. Anton DeHaas, professor of foreign trade in the Graduate School of Business Administration, New York University, amplified Mr. Taylor's thought in his address on "Fundamentals in Foreign Trade Education." Summarized, Prof. DeHaas' argument was that through education the American mind must gain the international consciousness and understanding that comes unconsciously to the European because of his closeness to the boundaries of many foreign nations, if it is to be engaged in foreign trade problems.

J. WALTER DRAKE

Chairman of the board of the Hupp Motor Car Corporation, Detroit, and one of the speakers at the Eighth Annual Convention of the National Foreign Trade Council.

Present Instruction "Useless"

On the subject of languages the professor described present methods of teaching languages in the schools as so inadequate as to be a waste of time. The average European understands at least one language other than his own, and the majority of cases, several languages. In Holland the student studies four languages. In American schools, the speaker pointed out, the student may take a language for two years, but there is no requirement that at least one language must be studied from the grammar to the high school. If we are to build up foreign trade machinery, he said, we must begin with the proper foundation. This must consist of one or more languages, history and geography.

In the two latter studies, Prof. DeHaas declared, the instruction given in the lower schools was of little benefit as a background for future training in foreign trade activities. The geography method employed is dry and uninteresting and the history as too much concerned with wars and politics and too little concerned with economics.

What is needed, he said, is a course of international understanding gained by the young American mind in the lower grades through the proper teaching of geography, history and languages, Prof. DeHaas stated, built to the advanced training in foreign trade. This training, he pointed out, must include a knowledge of administration and execution, production, product and production, payment and shipping, the market and the customer. The two factors he put emphasis on were market knowledge and a sympathetic understanding of the customer, and neither could be delegated, he asserted.

Replying to the claim that Europe afforded better courses and schools in foreign trade, the professor declared that there were more schools and more courses in the United States than in Europe, but that they dealt too much in details and not enough in those studies that develop insight. The training, as he described it, must be of such a character as to develop international consciousness as felt by those who live constantly in an international atmosphere.

Moving the thought of the importance of an understanding of language in foreign trade further along, the deepest significance of international understanding through education comes out in the short address of Col. Fred Cardway, vice president and general manager of the Packard Motors Export Corporation, on "Psychology in International Merchandising." To understand psychology one must know something of language, of history and geography. Col. Cardway said:

"Psychological truths are independent of time, place or race. Every step in a sales negotiation is a mental process—the mental attitude and mental expression of the salesman; the mental attitude and mental expression of the customer; the arousing of atten-

Digitized by Google

tion; awakening of curiosity or interest; creating desire; satisfying the reason and moving the will—all these are purely mental processes, and in their understanding is found the bases for successful, international marketing.

"Having gained full knowledge of the mental characteristics evolved from a given set of national influences, the salesman is then in the proper frame of mind to approach his prospects. His next aim should be to arouse curiosity. For curiosity whets one's appetite and when the salesman has directed the attention of the buyer towards an image of some thing new—a new idea, a new device, or a new pattern, a real step will have been taken towards clinching the transaction. The novel always incites a man's inquisitiveness."

Dr. Guillermo A. Sherwell, of the Inter-American High Commission, said that our foreign trade was being carried on in a relatively more haphazard way than European foreign trade; we had less system, less knowledge and perhaps less desire to establish system and acquire knowledge. Dr. Sherwell said:

"If I were asked what is the main fault with the American foreign trader, I should say that it consists of our shortness of vision. We cannot see beyond a short space of time. We are impatient; we want immediate results; we cannot wait; our bankers want money today rather than the business of the future; and our buyers and sellers want large profits right away rather than a sound, permanent market.

"Besides this fault, I think there is another almost as detrimental, consisting of our sacred respect, almost verging on adoration, for the kind of god, fetish or shibboleth: 'Our Rules.' I want our merchants to be warned against this god. I want them to abandon and to forget it and to put on their altars an opposite god, which is the only god of foreign trade: 'Your rules.'

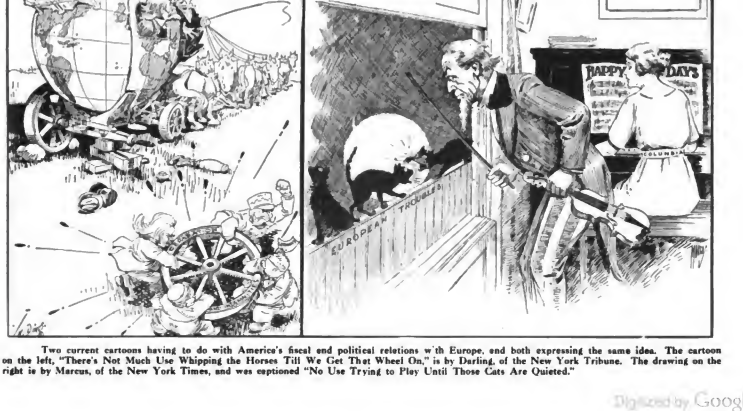
"We have had great success in recent years and we think it was due to ourselves, forgetting that it was due mainly to the very abnormal conditions through which the world has been passing. Now that our foreign trade is shrinking, we raise this question: 'Why is it diminishing?' And there are two main reasons: Because we do not know and do not want to know, and because we are still pleasing ourselves and not our customers."

Mr. Taylor's second problem was that of travel. It was his argument that more traveling abroad should be done by the heads of American industries. He regarded the present period of depression as a most opportune time for such travel. Much of the knowledge considered by Dr. DeHaas as essential to foreign trade could be picked up by industrial leaders if they spent some time in those countries where they are selling or expect to sell goods. Mr. Taylor made the statement that it was a pity that more of our better men did not mingle with foreign business men, industrial leaders and financiers.

J. Walter Drake Speaks

Among his problems Mr. Taylor did not consider that of government service in foreign trade, which, however, was the title of an address by J. Walter Drake, chairman of the board of directors of the Hupp Motor Car Corporation, Detroit. Mr. Drake outlined the function of the Government in world commerce in this way:

"Foreign trade is the nation's enterprise. The Government must not only establish the foundation for it but also must foster, encourage and participate in its conduct."



Foreign trade, he said, was the weakest point in American industrial development. This is the result of the contentment of industrial leaders in finding and developing domestic commerce, confident that this country is great enough to consume all that can be manufactured, when, as a matter of fact, there are many lines in which production power far surpasses consumption possibilities. As a result of this viewpoint the United States has not developed a foreign trade policy. Reverting to the Government's function, Mr. Drake said:

"Business can no more continue without government participation than could a private business abolish the sales organization when the season's output has been sold and trust to finding a new market each year for its product without sales service and effort. Diplomacy and foreign trade intelligence of the Government run through every line in the chart of the foreign trade structure. When these activities of the Government fail to function or break down, the business languishes.

"In the first place, there must be a single department of the Government in charge of all foreign trade service. Secondly, such a department should be organized and equipped in every respect equal or superior to the private business with which it co-ordinates, in scope, personnel and efficiency. There should be provided the means of obtaining and retaining the services of trained men who will meet the requirements of this highly specialized work. Finally, adequate funds must be provided by the Government to maintain the establishment on a plane equal in every respect to those of competing nations. If we are to accept the idea of government service in foreign trade, and indeed we shall not be long engaged in that trade if we have not such service, then as business men determined to prevent the frustration of our plans we should insist that the Government should have a real service under one head. The chief executive of the nation has given us his assurance that we are to have business in government. Certainly, here is one place to apply that principle. Abolish the two-headed control of foreign service.

"In order to utilize the necessary elements already existing, to preserve the best of their organizations, and to eliminate the great amount of duplicated effort, there should be one department under a general board in charge of foreign trade service. Under this board's direction the department should be built up out of the reorganization and consolidation of every form of activity of the Government in this connection. Of necessity, this board must have in its active membership the chief officials of the two departments of the Government concerned with foreign trade, State and Commerce. The board in charge of this department must so organise and arrange

Profits From Purchases

They Are Indirect But Nonetheless Tangible; Some Factors in the Process of Earning Them

By ELWOOD SAMPSON

Chairman, Public Relations Committee, National Association of Purchasing Agents, Detroit

THE PROGRESS of each individual firm through a period of depression may be described as follows:

Deflation is the period when the managing executive is giving his entire attention to conserving resources by cutting down expenses and eliminating every possible expenditure. Bottom is reached and the turn for the better is accomplished when he no longer must concentrate every mental faculty on reduction of outgo, but can give intense consideration to the various ways and means which have in them possibilities for profit. When this point has been reached the future outlook is basically one of improvement. For that business concern has then changed from operating on a purely negative basis to a positive one.

Profit, like labor, may be divided into the two classes—direct and indirect. Direct profit is the direct reward from successful sales effort. Indirect profit is the reward which comes fom any department other than sales in carrying out any special measures that indirectly increase the profit account of the business. By "special measures" I mean to exclude the standard requirements of a properly organized department.

Further, this same analogy between labor and profit is carried out in the problems affecting both. Direct labor is conceded to be an unavoidable necessity in the manufacture of any product. Direct profit is also a self-evident necessity, if a firm is to stay in business. Therefore the points at issue affecting either are generally clear cut and very few in number.

On the other hand, indirect labor and indirect profits are indirect in any showing made and are full of ramifications wherein great savings and great losses are equally possible. Consequently it is in this division of a manufacturing plant that managing ability or lack of it is so readily apparent in the great profit or loss resulting therefrom.

Indirect Profits in Purchasing

In this article we shall confine ourselves to the possibility of indirect profits which can be realized in the purchasing division.

Especially note that the emphasis is placed upon the words "profits from purchases" and not "saving from purchases." The latter is the term applied to the results obtained from a regularly organized purchasing department carrying out the standardized departmental functions of obtaining the right material within the time required, and at the best possible price. This is thoroughly understood by every business man and needs no consideration here.

The most evident possibility of purchasing profit is in foretelling the trend of prices. Although this is so recognized by almost every business man, still the development in this direction, with a few exceptions, is still in an infantile state.

The general method at present of judging the market trend is to talk the situation over with this one and that one who ought to be in a position to be fully informed concerning his particular commodity; read the various trade papers; note what various competitors are doing, and then act accordingly.

In this method judgment is based mostly upon surface indications. The danger of this is that surface signs apparently all point one way. Also, they have a most unhappy faculty of completely reversing themselves over night. Today everything looks rosy. Tomorrow is just the opposite.

A brief consideration of the immediate past will illustrate plainly how true this is. Sixteen months ago the demand on the surface appeared insatiable. Prices were all going one way, upward, at a continually increasing speed. Prosperity in the sense of large paper profits appeared to be insured for years to come.

Only a year later exactly the opposite was true in every respect. Business was in a greater state of stagnation than ever before in the history of the country. Prices were all going one way, downward, with no stopping point in sight. The whole country on the surface appeared at a standstill. There was no response to all the propaganda efforts to cause people to "buy now." Every surface sign indicated that nothing but general ruin was ahead.

The great majority of business firms, basing their buying judgment upon the surface signs outlined above, overbought a year ago to an immense degree and have held off completely this year from ordering or contracting, except for immediate and imperative needs.

On the other hand, here and there in Detroit and throughout the country have been buyers who have operated upon a carefully worked-out, scientific plan of forecasting the market. For such final judgment is based upon a consideration of the underlying fundamental factors and not merely on surface indications. These men were not buying heavy a year ago, for fundamental signs all pointed to a heavy decline during the latter part of 1920.

To illustrate how this is done, I am taking a tried and proved plan (not an academic one) and reducing it down to a classified outline of the factors to be considered:

I. General economic conditions whose effect is the same on all business:

1. The ratio of the total demand of all commodities to total supply.

(a) The irreducible minimum necessary to sustain life.

(b) The fluctuation due to the general buying attitude of the consumer.

2. The world production of gold versus the total world production of all other commodities.

II. Specific conditions which affect individually the various commodities:

1. Seasonal variations, or the tendency of the various commodity prices to maintain the same relative increase or decrease through the various seasons of the year. Several classes of this seasonal variations are the following:

(a) Staple articles of food whose seasonal price is based upon the time of harvest and is influenced by the length of time in which pronounced deterioration can be prevented.

(b) Perishable food products whose price is affected by the period of greatest plenty, and the cost of prevention from perishing.

(c) Manufacturing products subject to seasonal conditions affecting production, such as operating rolling mills in extreme hot weather.

(d) Products affected by seasonal demand, such as ice in summer and coal in winter.

2. Annual variation:

(a) Due to the amount produced each year as compared with previous years.

(b) Due to the amount carried over from the previous year as compared with previous carry-overs.

3. Ratio of total purchases to total consumption.

Substitution as an Element

III. Relative conditions affecting commodity prices. (By this is meant those conditions which cause a substitution of one commodity for another):

1. The common properties which various commodities have that permit commodity substitutions to be made.

2. The relative level of prices of the various competitive commodities.

3. Inventions and new manufacturing processes which permit specific commodities to be made cheaper and better than other commodities in the same competitive class.

IV. Government policies:

1. Taxation.

2. Currency inflation.

3. Tariff.

4. Regulation of business.

V. Trade association policies:

1. Combination to maintain arbitrary prices, or

2. The opposite policy of not permitting any such combination and through educational work improving the general productive ability of the membership.

VI. Financial and credit conditions:

1. The general policy toward business of the Federal Reserve Bank:

(a) As a corollary thereto the general policy of the individual banks toward commercial loans.

2. The rate of bank interest charged on commercial loans.

3. The general ratio of (1) cash assets to (2) stock inventories to (3) fixed assets.

VII. Transportation conditions:

1. The rapidity with which commodities can be transported long distances and correspondingly permit or prevent competition from firms at distant points.

2. The general level of freight rates, which correspondingly tends to permit or prevent shipments from distant points.

3. The specific commodity freight rates which give certain commodities or certain localities competitive advantages over others.

4. Artificial freight basing points.

VIII. Labor conditions in their effect upon commodity prices:

> DURING the next few years some of the tidiest profits in American industry will be *saved* out of operations. Heretofore, much of our profit has been *made*. But *saving* profit is a different thing altogether.—*James H. Collins, in the Saturday Evening Post.*

Digitized by Google

1. The general scale of pay.
2. The local scale of pay.
3. General labor efficiency.

The briefest consideration of the above will show how great is the difference foretelling price trends by following such a plan instead of by shrewd guess work.

It's Hardly Simple

The application of this plan is not a simple one in any sense of the word. The various factors are not distinct from each other and do not parallel each other. In fact they form a veritable network in their criss-crossing. The attempt to point out how to give the relative value to each of the factors outlined and how to apply them in a practical manner is impossible in this article. That would take several volumes. Also, there is no general plan which can be worked out to fit all business. So the most important thing is to work out a specific detailed plan of foretelling the price trends of the important commodities used by each particular company.

To accomplish this it goes without saying that proper training and experience and more than ordinary ability is essential.

A second important potential possibility for producing buying profit is that of "buying good will."

While "buying good will" is somewhat analogous to "selling good will," there are certain important differences. There are the well understood points (1) of financial strength; (2) of paying bills promptly, and (3) of creating a friendly regard. More than this is the rarely attempted policy of making sources of supply feel that the buyer has their best interests and real welfare at heart at all times. The following instance will illustrate the application of this:

A year or so ago the writer had 2,000,000 pounds of metal to purchase on a keenly competitive basis. The best price quoted to us was one half cent a pound less than the best price quoted by the same firm on the same quantity to the other party. I was curious to know the reason why and asked the president of the mutual source of supply why this difference in the price.

"Because of the difference in your buying policies," he replied. "You have our interests at heart and continually work with us in every way. If something goes wrong you immediately get in touch with us and have the trouble looked into promptly. On the other hand the other firm takes a 'high and mighty' attitude. They were just as apt as not to let a hundred thousand pounds of material accumulate for weeks and then reject it upon some technical imperfection. This makes it very costly for us to have to work over such a lot of material. We never have these costly experiences on our orders with you. Also, you constantly work with us to help take care of your requirements with the least changes in production, and to help us to keep our costs down. Because of this buying policy of yours we are able to produce your material for half a cent a pound less than we can produce the same lot for the other firm. You are, therefore, entitled to this differential in price."

As every business man knows, there are certain firms which everyone particularly likes to do business with, because they continually work for their customers' welfare. They co-operate in every way possible. As a result they gain and hold a place which cannot be taken away from them.

What It Does Not Mean

In the same manner "buying good will" can be cultivated with just as sure a reward as "selling good will." In cultivating "buying good will" I do not mean displaying a goodfellow generosity of spirit in giving a certain preferred few all the business in their line at any price which may be asked. This policy is bad for both buyer and seller. It is bad for any firm to feel that they have such a hold upon their customers that they can sell them at any price whatsoever. For this causes a gradual letting down in efficiency through lack of competition. This in turn hurts their respective customers in obtaining new business. Accordingly, a certain feeling of competition should nearly always be created and be felt continually by a buyer's source of supply.

But after the order has been placed there should be just as constant an effort on the part of the buyer to help his sources of supply as there is on the part of the latter to help its customer.

The cost is comparatively low to a source of supply when production can be carried on without interferences and without frequent re-running of large quantities of material. The cost is rapidly increased when this plan cannot be followed because of lack of co-operation on the part of the buyer.

One of the large motor companies has almost a nation-wide "buying ill-will" because of its high handed buying policy. Many firms have been caused immense losses purely through arbitrary and unjustifiable actions on the part of their purchasing department. The result is that many high grade firms, even in a time like this, refuse to do business with this particular motor car company. Also, during the period from October, 1919, to August, 1920, when the seller's market was at its height and the buying competition was at its worst, this one particular motor car company was almost uniformly charged more than any other company. It seemed that word had been passed through all the industrial sections of the country: "Now is the time to get back our losses." There was almost a gentleman's agreement to charge this company ten per cent more than any one else paid. Accordingly the "buying ill-will" which they had developed cost them some millions of dollars more than they had gained by their arbitrary stand in the past.

A third important potential possibility of producing buying profit is through the closest possible team-work between the engineering and purchasing departments.

With reference to equipment or requirements of a highly specialized nature, it is the general practice to turn the matter over to the engineering department, allowing it to make final decisions. To have the purchasing department merely to send a confirming order. In such a plan the technical ability of the engineer is fully utilized, but the marketing ability of the purchasing agent is completely lost sight of. The natural training of an engineer is such as to make him naturally work within very close limits and to very rigid specifications. His sense of value is not developed enough to cause him to give the cost feature of close specifications very fine consideration. On the other hand, if both engineer and buyer are held equally responsible and each required to give the matter his fullest consideration, some immense savings in price would be accomplished without any sacrifice of quality whatever.

An Example

Some astonishing results were accomplished in this direction by a large Detroit firm recently. The director of purchases said he believed he could make an appreciable saving in the cost of some of their materials if the chief engineer was instructed to work with him and give him as wide a range of limits as possible without injuring the quality. Instructions were issued to this effect and the two of them went to various sources of supply to work out first hand with them every saving in cost possible without allowing the quality of their product to suffer in any respect. It was found that upon one of their items of regular production they could eliminate a certain requirement, which was customery in engineering practice but which was unnecessary in this particular instance. This change means a saving of $30,000 a year on a normal production basis. Another item was changed at a saving of $10,000, another at $5,000 and another at $3,000, thus making a saving of some $48,000 a year upon only four kinds of material, purely through close teamwork between the engineer and buyer.

A fourth important potentiality of producing buying profit is in "selling" the purchase orders and contracts instead of "placing" them.

Of all of the various phases of purchasing in its highest professional sense this is by far the most difficult to do. It requires a man of exceptionally high caliber who has a wide all-

A Word About Mr. Sampson

ELWOOD SAMPSON, author of this article, has had several years' experience in professional buying, having been successively identified with the Rands Manufacturing Company, Keller Pneumatic Tool Company, Motor Products Corporation and Detroit Auto Specialty Corporation. No one in the buying profession, perhaps, has any more complete understanding of the factors entering into price trends.

Our readers will remember that in his March article in these columns Mr. Sampson stated that certain raw materials, especially copper, tin, lead, zinc, cotton and rubber, had reached bottom and that the next change in price in any of these would be an upward one. Subsequent events have proved how accurate was his forecast.

Writing in the February, 1920, issue of the Detroit Purchasing Agent, Mr. Sampson said:

"An analysis of all the statistics gathered and basic factors affecting the business situation shows clearly two distinct conditions ahead of us. The next big far-reaching change will be a period of deflation which will bring the business of the country back to a healthy, normal basis. This will scarcely make itself felt, however, before the latter part of 1920. The immediate future is a general advance in commodity prices and increase in volume of business. In fact the present outlook is for the greatest volume of business in dollars and cents that this country has known, for the first six months of 1920."

How true this proved to be, every business man knows.

A careful reading and study of this article will suggest to the wide-awake business executive the possibilities for "saving profits," as yet untouched, perhaps, in other departments of his organization.—The Editor.

Digitized by Google

around business knowledge, including particularly a thorough understanding of finances and of costs. This rare type of individual can utilize his knowledge to get his particular orders and business placed at a differential under that quoted to competitors. He will not do this by any "breaking down" of prices through taking advantage of the buyers' market. Instead he will do it by first gaining the complete confidence of certain sources of supply; second, by both working together and making a careful and detailed analysis of the various elements of cost involved in filling the buyer's orders, and third the mutual elimination of certain elements of cost unnecessary to carry on that particular business between the two firms. This particularly includes the ability on the part of the buyer to "sell" his firm's business to his sources of supply through being able to present the special advantages which his orders have over that of his buying competitors.

The various possibilities for buying profits presented in this article do not cover the whole range of possibilities by any means, but they are the very important ones which are potentially the most important factors for success in the long period of keen competition ahead of us.

This is now a buyers' market and undoubtedly will be for some years to come. "Buyers' market" means great possibilities of "profit from purchases," just as the "sellers' market" means great possibilities for "profit from sales." Many of the manufacturers may feel that this is outside of the possibilities within their own organization. In most cases I believe they will be mistaken because purchasing agents as a class have a knack of always measuring up to whatever is required of them. When it was a sellers' market and there was a great shortage of material they went out and got what was necessary to keep running, somehow, somewhere. The nature of their work is such that develops ability and initiative. Therefore if they are required to produce buying profits by realizing the fullest possibilities which lie within their province, the great number of them will do so.

On the other hand there are some who do not have the training and the wide knowledge and experience necessary to achieve success in this direction. The matter then becomes one for the general management to decide whether it wants to forego the realization of the possibilities of the situation.

In conclusion let me emphasize this as strongly as possible: All industrial history teaches us that the new methods successfully put into practice by the ablest leaders of today become the established practices of the rank and file of tomorrow. Therefore those firms who survive in the years of the keen world competition ahead of us will do so because they utilize the great opportunities for profitable buying.

Truck on Rails Solves Foundry Hauling Problem

Albion Malleable Iron Company's New Motorized Equipment for Removing Foundry Waste.

STUDY of the internal hauling problem of the Albion Malleable Iron Company, Albion, by a transportation engineer resulted not only in greatly increasing the efficiency with which the work is done, but also in saving the company $4,200 a year. This particular phase of the transportation end of the business consisted of hauling from fifty to sixty tons of foundry refuse and hot clinkers every day from the furnaces to the dump, a distance of about 1,500 feet.

Two two-horse teams, with the drivers and four shovelers, were required to handle this refuse each day. Quite frequently it was necessary for the crew to work several hours' overtime. The repair bills for equipment were very high and veterinary services for the horses were also extremely expensive, due to the fact that almost every day one or two horses would be injured by having fetlocks very badly cut by hot or sharp slag. Often the horses would be thrown and seriously injured. To do this work with an ordinary rubber-tired motor truck meant the destruction of a set of tires every day.

In loading the wagons the crane would pick up a large tray of refuse, and in attempting to dump it into the body usually succeeded in spilling about half of the contents on the foundry floor, necessitating rehandling at an additional delay and expense.

A Packard transportation engineer was called in to make a survey and analysis. The analysis showed that the investment in horses, wagons, harness, barns, etc., totaled approximately $3,900 and that the cost of operating this equipment was $22.80 a day, including the teamsters' and shovelers' wages.

As a result of the survey and analysis it was recommended that the company grade a roadway from the west entrance of the foundry out across the lowlands for a distance of 1,500 feet, purchase steel rails and ties and lay a miniature track the entire distance.

To operate on this track it was recommended that the company purchase a size "EF" Packard truck, equipped with a five-yard gravity side dump body. It was also specified that the rubber tires be removed and that in place of them there be flanged webbed cast rims, riveted to the wheels to follow the guage of the track.

After studying the recommendations the company officials decided to follow them out. The cost of 3,200 feet of fifty-pound steel rails and a sufficient numer of eight-foot oak ties to lay the track was approximately $3,500, not including the cost of labor. Considerable grading was done at one point and the material placed on the lowlands to form a roadbed or fill for the track.

By this time the truck was ready for delivery and was placed in operation. Its initial trip was an occasion that aroused the interest of practically the entire organization. An assemblage of officials and department heads watched the truck back into the foundry, receive a seven-ton load from the crane, make the run to the dump and back again in less than fifteen minutes, ready for the second load. The entire accumulation of approximately sixty tons was taken out and dumped in about two hours' time. The driver was then taken off the truck and put on other work for the remainder of the day.

After watching the operation of this unit and keeping cost records for about a month it was discovered that the fixed charges per day were $7.71, including interest on the truck. The variable charges were $1.05 because the unit would cover only about five miles a day. The total cost was therefore $8.76 a day, as against $22.80 for the operation of the horse equipment, a net saving of $14.04 a day, or approximately $4,200 a year.

The efficiency and dependability of this unit in this particular class of work has so impressed the officials of the company that they

New Rate Adjustment Sought

All Michigan Freight Charges to Be Involved In Proceedings Instituted By Traffic League

By ERNEST L. EWING
Counsel, Michigan Traffic League, Grand Rapids

THE LOWER PENINSULA of Michigan is a large and important part of what is known as Central Freight Association territory in connection with freight rate matters. In 1914 the Interstate Commerce Commission granted the eastern railroads, including the Central Freight Association lines, an increase of five per cent in all freight rates and commented upon the class rates in C. F. A. territory as being on a very low basis or scale. In 1917, in what is known as the "C. F. A Class Scale Case," initiated by the railroads, a new and substantially higher scale of rates, known as the "Disque Scale," was authorized by the federal commission for application throughout C. F. A. territory, with the exception of that part of the lower peninsula of Michigan lying north of the main line of the Michigan Central railroad from Chicago to Detroit. The new and higher scale of rates also carried the fifteen per cent advance when it became effective

The reason for excluding such a large part of the Lower Peninsula from the benefits of the new scale of rates was the contention of the Michigan railroads that, although it was generally a higher scale of rates than had prevailed for many years, it was not high enough for Michigan. The representatives of the Pennsylvania Lines, New York Central Lines, Pere Marquette, Grand Trunk and other Michigan railroads contended before the federal Interstate Commerce Commission that the Lower Peninsula of Michigan north of the Michigan Central main line was so sparsely populated and produced and consumed such a small volume of traffic as to make a much higher scale or adjustment of rates necessary if the carriers were to earn anything in excess of operating costs. The representatives of the Michigan railroads strongly urged that Michigan conditions affecting railroad revenues were comparable only with those prevailing in the sparsely populated sections of the New England territory.

Michigan freight payers located north of the Michigan Central main line were not strongly represented in that proceeding and therefore very little was offered in contradiction of the railroad statements of unfavorable conditions and necessity of higher rates in Michigan than in any other part of the territory then receiving consideration. Of the cities and towns in Ohio, Indiana and other parts of C. F. A. territory thirty-seven were organized for the purposes of the C. F. A. class scale case, under the leadership of their principal traffic representatives, and were very active throughout the case, but it was not their object to protect and advance Michigan interests; they were consistently looking out for Toledo, Fort Wayne, South Bend, Indianapolis, Chicago, Milwaukee, Green Bay and other manufacturing and jobbing cities and towns that compete, in Michigan, with Michigan manufacturers and jobbers.

It was the contention of the Michigan railroads that traffic conditions not only justified a higher scale of rates in Michigan, but that conditions became more unfavorable and the necessity of higher scales of rates became more urgent as the distance from the Michigan-Indiana-Ohio state line increased, and that rates, to, from and between points in the Lower Peninsula should be based upon progressively higher scales for each of several zones or cross-sections of Michigan. The Interstate Commerce Commission had very little evidence in rebuttal of what the railroads claimed. That was due to the failure of Michigan freight payers to appear in the case or to support any effort on their behalf. The Commission finally approved the railroads' plan of rate making whereby the Lower Peninsula was divided into four zones, each having a progressively higher scale of intrastate rates as the distance from the southern boundary of the state increased.

The basic scale, known as the "Disque Scale," was prescribed for all of the C. F. A territory outside of Michigan and including that part of Michigan on and south of the Michigan Central main line; that part of C. F. A. territory was established as "Zone A." The portion of Michigan lying north of the Michigan Central and south of a line drawn from Muskegon to Bay City was established as "Zone B," and its scale of rates was made substantially higher than the basic, or "Zone A," scale. The northern half of the Lower Peninsula was divided into two additional zones, "C" and "D," each having progressively and substantially higher rate scales.

Intra-state Proceedings Follow

Following that decision by the Interstate Commerce Commission, the Michigan railroads appeared before the Michigan Railroad Commission to demand the same adjustment of Michigan intra-state rates. Michigan freight payers again failed to participate in that proceeding with sufficient strength and preparedness successfully to combat the carriers' representations and the activities of those who appeared on behalf of Toledo and other Ohio and Indiana shippers. The result of that proceeding was the establishment of two additional and overlapping zones for intra-state rates, the intra-state zones being known as "Zones E and F." Zone "E" includes the lower half of the state and zone "F" the northern half of the Lower Peninsula. The dividing line runs from Muskegon to Bay City but the "Thumb" district is included in the lower zones.

The Michigan rate adjustments so established were entirely unsatisfactory to all the Michigan freight payers or their traffic representatives who gave the matter any attention as it developed, but they were relatively few as compared with the number actually affected. The Michigan Traffic League was then a newly organized body of a membership composed of Michigan shippers, principally shippers located in the southern portion of the state, and was not then sufficiently representative of the entire territory successfully to oppose the carriers and the outside interests.

The zone adjustments became effective in the latter part of 1917 and the early part of 1918. Federal control of railroads became effective January 1, 1918. As soon as the United States Railroad Administration organized its rate committee the Michigan Traffic League initiated proceedings before the Detroit District Freight Traffic Committee, which was the committee having jurisdiction, and endeavored to accomplish a substantial modification of the Michigan rates. That effort produced no results during the period of federal control, and with the passing of the Railroad Administration all possibility of relief from that source ended.

On June 25, 1918, the Michigan rate scales were increased 25 per cent and that increased the rate "spreads" between the several zones. A point in Zone "B" having a rate four cents higher than a competing point in Zone "A" found its rate disadvantage increased one cent by the 25 per cent advance. Not only were the scale or base rates increased but the differentials as between the zones were increased. On August 26, 1920, all rates were increased 40 per cent and all rate "spreads" or "differentials" were again widened. The increase in the rate "spreads" was important as between competing points in Michigan but was vastly more important in that it greatly increased the advantages over Michigan shippers which the original zone adjustments gave to competing shippers in other and adjoining states.

As Michigan rates now stand, they are not only excessive as compared with rates in all other parts of the United States but they are most unjustly discriminatory as against Michigan and in favor of Ohio, Indiana, Illinois and Wisconsin shippers. Detroit wholesalers cannot compete with Chicago, Milwaukee and the twin cities, St. Paul and Minneapolis, in the Upper Peninsula. That is equally true with respect of Grand Rapids and other Michigan jobbing points.

The effect upon Michigan manufacturers is most serious in connection with their inbound shipments of materials. They not only ship their products to competitive markets under very unfavorable conditions and rates but they pay a great deal more for their materials because of the unfavorable inbound rates.

As between points in the Lower Peninsula of Michigan, the disadvantage of the zone system of mileage scale rates are greatly aggravated by the carriers' use of inflated mileages. The mileage scale rates are not applied by the direct and shortest routes. The railroads endeavor to get the longest haul possible. To illustrate that the rates from Lansing to Muskegon are cited. Those rates are based on a distance of 122 miles. The distance from Lansing to Muskegon, via Grand Rapids, is approximately 96 miles. A stronger illustration is afforded by the rate adjustment as between Cheboygan and Allegan. Those rates are based on the distance via Michigan Central from Cheboygan through Bay City, Jackson and Battle Creek, half-circling the Lower Peninsula, whereas the distance via the direct route, Cheboygan to Mackinaw City, Michigan Central; Mackinaw City to Grand Rapids, Pennsylvania, and Grand Rapids to Allegan, New York Central, is about 100 miles shorter. The Michigan Traffic League has checked several hundred instances of inflated mileage in Michigan.

Prior to the 40 per cent advance of August 26, 1920, the Michigan Traffic League filed a complaint with the Michigan Public Utilities Commission wherein it sought a readjustment and substantial modification of the intra-state rates; the establishment of joint through rates between Upper and Lower Peninsula points in lieu of the combinations of local rates to and from Mackinaw City which now exist; Lower Peninsula shippers from Upper Peninsula markets and give that portion of Michigan over to competing shippers in other states; the elimination of zones "E" and "F" and the correction of inflated mileages. The railroads answered that complaint to deny its charges

Digitized by Google

and to say that any order by the Michigan commission reducing existing rates would be taken to the Interstate Commerce Commission for review under the provisions of the Transportation Act, 1920. It became apparent to the League that a majority of the Michigan shippers were equally interested in the obtaining of some modification of interstate rates and that a more comprehensive procedure was advisable. The complaint before the Michigan commission was therefore withdrawn, after a joint conference between the members of the League and representatives of the Michigan railroads, before the Michigan commission, had failed to produce any helpful results.

It is now the purpose of the Michigan Traffic League to file a complaint against interstate rates to and from Michigan points with the Interstate Commerce Commission, and a complaint against intra-state rates between Michigan points with the Michigan Public Utilities Commission, at a very early date, and to petition the two commissions for a joint hearing under the provisions of the Interstate Commerce and Transportation Acts. That is expected greatly to simplify the proceedings, and it will deprive the railroads of any grounds upon which to threaten an appeal from the Michigan commission to the federal commission.

The Michigan Traffic League has greatly strengthened its organization. Its membership is largely representative of Michigan freight payers. The traffic committee of the Michigan Manufacturers' Association is principally composed of members of the Michigan Traffic League. The directors of the Michigan Manufacturers Association have adopted a resolution wherein they recommend the activities of the League in this matter as being entitled to very careful consideration by all members of the manufacturers' association. A similar procedure before the Interstate Commerce Commission against all C. F. A. class rates which is proposed by an organization having its headquarters at South Bend, Ind., is not endorsed by the Michigan Manufacturers Association.

There is much to indicate that the Michigan Traffic League will be successful in this effort. The League is composed of pratical, experienced, traffic men who are thoroughly familiar with Michigan transportation affairs and conditions, and with the manufacturing and jobbing conditions in Michigan. A majority of the League members are experts in rate matters and in Commission procedure. The organization of the Michigan League is similar to that of the National Industrial Traffic League and members of the state league are prominent in the activities of the national organization.

The members of the Michigan league, individually and collectively, have endeavored to avoid the necessity for evidence before the federal and state commissions by almost four years' effort to prevail upon the Michigan railroads properly to modify and otherwise adjust the Michigan rates, and they have been forced to the conclusion that no substantial modification of Michigan freight rate conditions will ever be obtained without Commission procedure. The officers of the League are frank to say that they want Michigan rates reduced as well as equitably related to the rates enjoyed by competing territories. It will be their contention that the Upper Peninsula of Michigan must be given the full benefit of the "Zone A" scale of rates and that joint through rates between the Upper and Lower Peninsulas must be established on a basis that will not permit shippers in other states to shut Michigan shippers out of the Upper Peninsula markets.

It is expected to handle this matter to a conclusion before the two commissions within the next six months. The League members and committees are now actively canvassing the state for such further support and cooperation as remains necessary to their plan of action. Every shipper, every association of shippers and every commercial organization in Michigan is invited and urged to assist the League. The members of the League are doing all of the work involved in the preparation of the case and that will greatly reduce the cost of the effort.

The writer has been selected as counsel for the League. Parties desirous of communicating with the League should address E. C. Nettels, in care of the Postum Cereal Company, Battle Creek, the League's secretary and treasurer, or the writer, at Grand Rapids.

RAUCH HEADS CONSOLIDATION

At the organization meeting of the Consolidated Paper Company, Monroe, a corporation which is the result of the merger of the Boehne & Rauch Paper Company and the Monroe Binder Board Company, Edward C. Rauch was elected president; L. W. Leathers, Eugene C. Betz, J. C. Bullis, F. E. Williamson and H. L. Rauch, vice-presidents; W. C. Tullis, secretary, and L. W. Newcomer, treasurer. These, with others to be chosen later, will constitute the board of directors. The corporation is capitalized at $7,500,000, of which $5,000,000 is common and $2,500,000 preferred.

DWIGHT SUCCEEDS HANNUM

John H. Dwight, who since January, 1920, has been assistant general manager of the Saginaw Products division of the General Motors Corporation, has been appointed general manager, succeeding George H. Hannum, whose selection as general manager of the Oakland division recently was announced. Prior to joining GMC Mr. Dwight has been identified with the Belle City Malleable Iron Company and Racine Steel Castings Company as vice-president and general manager and with the Mitchell Motors Company as plant manager. As general manager of the Saginaw Products division he will have supervision of the Jacox steering gear plant, the crank shaft plant, the motor plant, the grey iron foundry and the malleable iron foundry, all at Saginaw.

The Editor's Job

[From the Dodge Idea]

THE editor's job is not the easiest in the world.

He has one definite objective—to plan and publish a magazine that will please the majority of readers. To do this involves a tremendous amount of work of a nature that is often beyond the conception of the reader.

In the first place, it involves the reading of hundreds of manuscripts submitted. This, in itself, is work. A manuscript may be found which bears every promise of being readable, instructive and worth while, but it may fall flat in the closing paragraphs. Again, a well-written manuscript may seem to meet every editorial requirement, but a careful reading may bring to light some highly undesirable feature that means rejection. Some statistical data may be slurred in the writing; some biased and unreliable views may be expressed that effectually kill the article in question.

The editor must judge every article by a multiple standard. He must judge calmly and with as large a measure of impartial intelligence as he is able to command. He must, in a large measure, guess the type of matter 32,000 intelligent factory executives want to read. He must conceive their respective and collective likes and dislikes and be on an eternal search for live and constructive matter.

He must have a conscious realization of the responsibility on his shoulders as a builder of public opinion. He creates and moulds opinion and policies of far-reaching effect by the very nature of the editorials he writes and the text matter he publishes.

He must build up faith in his magazine, for unless the readers have absolute faith in the editorial and text matter in the magazine, their faith in the advertisements will he exactly on a par with their faith in the reading material.

BUICK POWER PLANT COMPLETED

Within a few days the new $4,000,000 power plant of the Buick division, General Motors Corporation, Flint, will be turned over to the officials by the contractors. It has taken fifteen months to build this plant, which is said to be the largest one in the state and the most complete unit of the kind. It will develop 8,000 k. w., and has automatic machinery for handling coal, cooling and handling ashes and cooling water used in the boilers.

THE SITUATION IN CLEVELAND

According to reports from Cleveland, most of the automotive manufacturing concerns there have been increasing their production, which, however, is not in most cases up to the peak output of 1920. The Peerless Truck & Motor Corporation is said to be turning out twenty-five to thirty cars a day and finding the general demand maintained. The company is not making more than what distributors' orders call for. With the F. B. Stearns Company business is declared to be satisfactory. The Grant Motor Car Corporation has been producing thirty cars a day and is expected to reach forty shortly. The Lang and Rubay body making concerns are said to have a fair amount of orders booked. The report is that the business of the Standard Parts Company is improving. The White Motor Company is still operating at the rate of fifteen trucks a day, which is less than 50 per cent of capacity. At the Winton factory the conservative policy which has always been followed is prevailing, the manufacturing program being practically the schedule of dealers' and distributors' orders. At the Cleveland and Chandler motor car plants activities have been speeded up.

STEWART-WARNER SALES UP

Sales of the Stewart-Warner Speedometer Corporation for April aggregated as much as those for the first quarter of the year, it is reported.

Congress the 1921 Wonderland

It's a Strange Thing, This New Atmosphere of Welcome for the Business Man in Washington

By TOM L. MUNGER

One of the multitudinous impressions that crowd upon one who visits Washington and transacts business with any of the governmental departments there is one that stands out more clearly than all the rest. This is especially true if one has had occasion to make similar visits during the administration that passed out of existence this year. The outstanding impression nowadays is that one has suddenly entered a world wherein the ordinary values of life have been turned topsy-turvy; wherein one encounters very casually those unnatural phenomena revealed to Alice in Wonderland.

For example: The WELCOME sign has been hung out for the business man. It is true there had been much talk about this, but business men were almost persuaded it couldn't be. Their experiences with the former administration had led unmistakably to this conclusion, and moreover, one of the country's most eminent divines had told them flatly they had no business interfering with the processes of government—processes that presumably were beyond their feeble powers of comprehension.

At the White House

Today the WELCOME sign for the business man is displayed more prominently upon the doorstep of the White House than anywhere else in Washington. Strange as it may seem to those who have not followed closely the course of events at the national capital, the business man who has legitimate business with the President of the United States may see him with very little formality. The attitude of the nation's chief executive in this respect, of course, has borne a profound influence upon every department of the Government, and in no instance has this influence been more profound than in Congress.

Whereas in the past the labor leader has been welcomed and his word has only too often been incorporated into law, today the business man is welcomed and Congress is busily engaged in the work of incorporating some of his words into law.

Of course the personnel of the present Congress is comparatively little changed intrinsically from that of the preceding one or the one before that, at least so far as general character and ability are concerned. The only vital change has come in the virtual elimination of the former attitude of suspicion of the business man and the apparently great decrease in the popularity of the labor leader. In fact, in some quarters there is evident a tendency to suspect the motives and the fairness of the latter.

Congress still has a large quota of lawyer congressmen; those snowy-haired old fellows (and some young ones, too), who remind one forcibly of that passage in the immortal Alice which goes:

"In my youth," said his father, "I took to the law,
And argued each case with my wife;
And the muscular strength which it gave to my jaw
Has lasted the rest of my life."

Then, too, there is the usual number of Dormouse congressmen; the Yea-and-Nay Sayers, who never take an active part in any discussion, but sit heavily through it all, apparently almost wholly somnolent, rousing themselves sluggishly at the end to cast their votes, only to return at once to their former state. Naturally the rightness or wrongness of the votes cast by these individuals depends entirely upon the second-hand information they receive, and today they vote right oftener perhaps than ever before, because nowadays the listener in Congress sometimes gets an earful of something besides oratory.

And again, there is the edifying spectacle of Judge So-and-So, the elderly and dignified congressman from a Southern state, who takes an active part in a committee hearing, serving as spokesman for the labor opponents of a measure which is damned as "iniquitous and subversive of the rights of labor."

"You are old, Father William," the young man said,
And your hair has become very white;
And yet you incessantly stand on your head—
Do you think, at your age, it is right?"

A pathetic sight, truly, this conservative gentleman, who, having been forced once upon a time to "stand on his head" to obtain an administration view of legislative requirements, is still too conservative to get right-side-up with the times on such short notice.

But it must not be inferred that all members of the present Congress are either long-winded or somnolent and at odds with the new conditions. Indeed, for the most part, quite the opposite is the case. Gone are the black string tie, the Prince Albert of honorable tradition and the wide-brimmed black felt hat. Congressmen cut their hair short nowadays and their attire is more often like that of the tired young business man when striving to do a little business before going out to tire himself some more on the golf links. They "make it snappy" these days in the halls of Congress.

The opportunity for making the observations upon which were based the foregoing reflections was given by the occasion of a hearing before the House committee on merchant marine and fisheries on the bill introduced by Rep. Frank D. Scott, of Alpena, Mich., to revise the LaFollette Seaman's Law. This measure, which grew out of the Seaman's Act Conference held on April 8 and 9 under the auspices of the Detroit Board of Commerce, is intended to relieve Great Lakes shipping of the burdens that are slowly forcing it out of existence.

The LaFollette Hearing

With regard to this bill and the hearing thereon, it is needless to say more than that 60 representatives of the Detroit Board of Commerce, Lake Carriers' Association, merchants and vessel owners and operators, and of commercial organizations, shippers and vessel men in the Great Lakes states, appeared before the committee on April 2, 3, 4, 5, 6, 7 and 9.

It was made very clear to the committee that industrial and commercial interests on the Great Lakes have been greatly injured by the curtailment of vessel service that has resulted from the operation of the LaFollette law and that a revision is vitally necessary. The vessel men also made clear the justice of their demand for a revision. Several labor leaders, including Furuseth, international president of the seamen's union, were present and indulged in some perfervid oratory, which did not seem to impress a majority of the committee very much.

At the conclusion of the hearing it was generally conceded that, while since 1915 annual attempts to have the LaFollette law revised have failed, it looks this year as if a favorable revision would be obtained. But the end is yet to come, and it may safely be asserted that if any let-up of pressure in favor of the revision is permitted, the failure of still another attempt at revision will be recorded.

Folks Do Say, Though, That Until Their Mother-in-Law Came to Live With Them Their Family Life Was Perfect

---

$35,000 LUMBER FIRE

A large dry shed of the L. Stephenson Lumber Company, Wells, was destroyed by fire a few days ago, causing a loss estimated at $25,000, while the station and general office of the Escanaba & Lake Superior Railway Company was damaged to the extent of possibly $10,000. The shed contained a large quantity of dry pine and other lumber. A gale was blowing at the time of the fire and for a time the town was in danger of destruction.

ROMEO ELECTION

The Romeo Business Men's Association has elected the following officers: President, B. Roy Brooks; vice-president, Harry Gray; secretary, Charles T. Bradley; treasurer, J. N. Rowley.

MICHIGAN REPRESENTATIVES NAMED

Among the directors elected at the recent third annual convention of the Mississippi Valley Association, John V. Carr, Detroit, and J. G. Graham, Jackson, were chosen to represent Michigan. United States Senator William B. McKinley, Champaign, Ill., was elected president.

CHICAGO REO'S NEW MARK

The Reo branch in Chicago announces that April was the biggest month of business in its history, 186 passenger cars and speed wagons being sold, which is twelve more than the total for last October, which then constituted the high mark. April sales were 20 per cent better than those of March. The May outlook is good.

COOK-WILLOUGHBY PARTNERSHIP

R. R. Cook and D. J. Willoughby, well known in automotive circles, have organized a company to be known as Cook & Willoughby, Inc., to distribute the Houdaille hydraulic shock absorber in Michigan and have located the salesroom and service station at 4465 Second avenue, at Prentis avenue. The Houdaille shock absorber is a French invention, the American manufacturing rights for which are held by the Houdaille Company, Buffalo. It is a shock absorber for motor cars used extensively in Europe. At one time Mr. Cook was foreign sales manager for the Cadillac Motor Car Company, at another time was connected with the Lalley Light Corporation. Mr. Willoughby has been associated with the Dodge and Studebaker organizations and also the Lalley Light Corporation.

OLDS SHY OF MATERIALS

The Olds Motor Works, Lansing, is meeting with more difficulty in obtaining material for manufacturing than it is in selling cars. While the company has orders for 10,000 vehicles on its books, it finds it hard to get a balanced stock of materials, the shortage being nearly as acute in some lines as during the war. The company is heavily booked on the new fours and eights, and with a full supply of material is assured of a big production throughout the summer.

Guy H. Peasley has been made sales manager of the Olds, succeeding Charles A. Tucker, who resigned to return to the Nebraska Oldsmobile Company, Omaha, of which concern he is president and general manager. Mr. Peasley joined the Olds organization in 1911 as a stenographer and bill clerk. For four and a half years he was head of the distribution department and last year was made assistant sales manager.

Thomas O'Brien, former head of the sales promotion department, has been named assistant sales manager.

KELSEY SOON IN PRODUCTION

The Kelsey Motor Company, Newark, N. J., incorporated last year, has already produced its first cars and is developing an enlarged production schedule, which, it is expected, will be attained by the end of May. The company was formed to manufacture and market an automobile with an improved type of transmission which C. W. Kelsey, vice-president and general manager of the organization, developed at his own expense during the last seven or eight years. The Kelsey Motor Company is capitalized for 200,000 shares of $ per cent cumulative preferred stock at a par value of $101, and 400,000 shares of common stock of no par value. Something less than one-third of the common stock has been set aside and placed in trust for the benefit of the original organizers. This stock they cannot get possession of until the company has earned two years' dividends on the preferred. The remainder of the common has been and is being sold in conjunction with the preferred.

NEW DETROIT GEAR CONCERN

Announcement is made that the Stevenson Gear Company, a new corporation organized in Detroit with capital of $3,600,000, will start work this month on a $1,500,000 factory which will employ 500 men. The concern will manufacture gears on special machinery invented by G. E. Stevenson, Indianapolis, secretary of the Stevenson Gear Company of Indiana, a $10,000,000 corporation. Richard T. Wingo is president of the Detroit company; Frank C. Sibley, secretary, and G. W. A. Linton, vice-president of the American State Bank, treasurer. These with Mr. Stevenson and E. D. Johns, the latter treasurer of the Indiana corporation, are directors.

DURANT DENIES RUMORS

W. C. Durant has issued a statement in New York denying that he is contemplating a merger of the Studebaker Corporation and the Pierce-Arrow Motor Car Company into Durant Motors. In a short time, he says, he will outline formally the plans of his new organization.

SOME RESULTS OF JORDAN'S CUT

A statement issued by the Jordan Motor Car Company, Cleveland, is to the effect that following the price reduction announced May 1, applications for dealer franchises were received from 436 firms and individuals. Within two days after the announcement dealers delivered 239 automobiles. The May production will not exceed 600 cars.

STUDEBAKER EARNS $2,110,577

Net profits of the Studebaker Corporation for the three months ended March 31 were $2,110,577 after deduction of charges and federal taxes, comparing with $4,472,092 for the similar period of last year. Sales aggregated $18,478,270, as against $23,301,242. Shipments were 11,620 cars, compared with 13,414. Quarterly dividends of $1.75 have been declared on the preferred and common stocks, both payable June 1 to shareholders of record May 10.

ADDING THREE TRUCK MODELS

The Gotfredson-Joyce Corporation, Ltd., Walkerville, Ont., which has been making a two-ton truck, called the G & J, has placed on the market a 3½-ton model. This model has a four-cylinder Hinkley engine, worm-drive Timken-Detroit axle, Brown-Lipe sliding gear, Timken roller bearings and nickel steel gears throughout, Spicer propeller shafts and other standard fittings. The price of the chassis is $5,175, or $1,375 more than the price of the 2-ton chassis. The concern expects to place on the market shortly a 5-ton model as well as a 1-ton light truck. The officers and directors of the Gotfredson-Joyce Corporation are: Benjamin Gotfredson, president; Robert B. Gotfredson, vice-president, and Frank H. Joyce, secretary and treasurer. Benjamin Gotfredson and Mr. Joyce are both officers of the American Auto Trimming Company, with plants located in Walkerville, Detroit and Cleveland.

A GMC APPOINTMENT

The General Motors Corporation announces the appointment of E. F. Johnson as general manager of the inter-company parts division, with headquarters in Detroit. Mr. Johnson assumes supervision over Saginaw Malleable Iron, Central Foundry, Michigan Crankshaft, Central Gear, Saginaw Products, Canadian Products, Northway Motor, Central Forge, Central Axle and Muncie Products.

MULLINS BODY REPORT

For the three months ended March 31 the Mullins Body Corporation reports profits of $73,155 on $320,050 of sales. After deduction of taxes, interest, etc., the surplus left was $22,473, which, added to former surplus, brings the total up to $2,168,458. It is reported that this concern shortly will remove from Warren, O., to Detroit.

More Car and Tire Price Cuts Announced

By MARC BRAUN

PRICE REDUCTIONS by automobile and tire manufacturers continue, especially among the latter.

As was announced last week, Jordan, Marmon and Goodrich inaugurated the current movement. Since then the Chevrolet Motor Company, Flint, and the Oakland Motor Car Company, Pontiac, in the automobile field, and the Lee Tire & Rubber Company, United States Rubber Company, Goodyear Tire & Rubber Company and Pennsylvania Rubber Company of America, among the rubber goods makers, have followed suit.

Chevrolet and Oakland being General Motors units, reports are already going the rounds that all the other GMC motor vehicle subsidiaries—Buick, Cadillac, Sheridan, Olds and General Motors Truck—will fall into line sooner or later.

Officials of some of these concerns only a few weeks ago declared that price reductions with them were not being contemplated—that in fact "it couldn't be done" at this time. However, the writer has found that the meaning of "it can't be done" sometimes is "it can be done." In our issue of April 16 there appeared excerpts from a number of letters from motor car makers on the price situation which gave the impression that price cutting at this stage of the selling season couldn't be done. Indeed some of the makers characterized recessions as "suicide." But some of them have done it since—not killed themselves, but cut their prices. No wonder, then, that the writer received a neat, short note from a sales manager of one of these concerns, in which he wrote: "'It can't be done' isn't good English. It can always be done; it's just a question of when."

The Chevrolet Motor Company reduced the prices of its "Four Ninety" model 21 1-3 per cent—from $160 to $180, according to model—but no reduction has been announced on its higher priced cars, the F-B model. New and old prices are as follows:

	New	Old
4-90 Five-passenger Touring	$ 645	$ 820
4-90 Roadster	635	795
4-90 Coupe	1,156	1,325
4-90 Sedan	1,195	1,375
Delivery Wagon	645	820
Model T truck chassis	1,225	1,325
Model G truck chassis	720	920

With the announcement of the new prices, the recent bonus or rebate offer of the Chevrolet Motor Company becomes void. This offer was that if 50,000 cars were sold by the company in the United States and Canada between January 1 and July 31, 1921, the purchasers were to receive a rebate of $70 on open cars and $100 on closed vehicles.

The Oakland Motor Car Company made a reduction of $250 on its open and closed models, as follows:

	New	Old
Five-passenger Touring	$1,145	$1,395
Three-passenger Roadster	1,145	1,395
Coupe	1,815	2,065
Sedan	1,815	2,065

In addition to the reports that other General Motors Corporation units will reduce their prices, the names of four other Michigan companies have been mentioned in the same connection.

Commenting upon the recent tire reduction by the B. F. Goodrich Rubber Company, the Wall Street Journal says: "Straight 20 per cent reduction in tire prices by the Goodrich company was the largest single price cut ever made by any of the big rubber companies. Following the 15 per cent reduction last November, it places Goodrich schedules on a basis where they represent a decrease of approximately 32 per cent within six months. Current prices are about on a plane with 1914 prices and more than 40 per cent lower than peak prices during the war. The following tabulation of three popular-sized Goodrich fabric and cord tires shows prices as they are at present, as they were during the peak days in 1920 and what they were in 1914 previous to the war:

	Present Prices	March 1920	August 1914
Fabric—			
30 by 3½	$16.00	$23.20	$13.15
32 by 3½	20.25	28.05	20.35
32 by 4	26.90	36.80	27.50
Cord—			
32 by 4	43.85	58.70	42.85
33 by 4½	48.40	62.10	50.95
35 by 5	61.90	79.25	61.65

At the time this is written the exact extent of neither the Goodyear nor the United States tire cut had been made public. In the case of Goodyear, however, it was officially stated that a cut of 20 per cent was unwarranted and could not be made. The Pennsylvania Rubber Company of America announced a reduction of 20 per cent on cord and fabric tires, effective at once. The Lee Tire & Rubber Company made a cut of 20 per cent on cord and fabric tires and 15 per cent on puncture-proof tires.

At the time the Jordan company reduced its prices reports were already current that the Ford Motor Company was planning similar action. In reply to an inquiry in this connec-

INQUIRIES SOLICITED

The Machine Specialty Company

ANN ARBOR MICHIGAN

tion a Ford official said: "We do not know the origin of the rumor to which you refer, that there is to be a reduction in the prices of our cars, but in any event it has no foundation, as we are not devoting any thought to this subject at the present time. In any event it has never been our policy to make an announcement with respect to any price change prior to the time when it is to be put into effect."

Another of the higher officials of the company said: "It has never been the policy of the Ford company to govern its price policy according to what other automobile manufacturers are doing or may do. The Ford company follows its own policy, based on its business. When our business is found by us to warrant a price reduction there will be no waiting or watching what anybody else may be intending to do. And in the same way, if we think that we ought to advance our prices we shall do so whenever we think it necessary."

Asked about the price situation, an official of the Packard Motor Car Company said: "We are quite satisfied with the way business is coming to us. There are people who are under the impression that because prices are cut business will at once greatly increase, but there are also a good many people who are willing to buy the standard products made by concerns of high standing, of long established reputation and known to give a man his money's worth.

Motor Industry's Progress Shown in April Summary

A month's sustained and unbroken progress in the return march of the automotive industry is reflected in the May analysis of conditions made public this week by the Motor & Accessory Manufacturers Association.

"The gratifying betterment of fundamental factors noted in last month's survey is increasingly manifest in the first-hand reports and authoritative financial data consolidated in the summary for the month of April, says M. L. Heminway, general manager of the Association.

"Payments for the last month have been better than for the three months prior," says the report. "More firms are paying their current accounts in full on the date, and an increasing number are paying a larger proportion of their notes as they fall due, quite a number paying in full.

"Releases on old orders show a decided improvement. Many of the car and truck manufacturers are placing orders for new materials. Quite a number of vehicle manufacturers are operating their plants at full time or nearly so."

"Altogether," says the report, in recapitulation, "there is a decidedly better feeling among our members. Collections are better and money required from banks seems to be somewhat easier. Many plants are resuming operations on a larger scale than heretofore, and the condition of extreme depression has certainly changed for the better."

Makers of automotive accessories and the smaller replacement parts report an unusually large volume of business from dealers and jobbers.

"OLD TIMERS" OF THE WORLD

The Old Timers Club of the automotive industry may become international in scope. J. Ernest Miller, head of John Miller & Son, Ltd., Montreal, Canada, has written to the officials of the club suggesting that provision be made for a Canadian branch, as there are many "old timers" in the automotive industries in Canada who would like to join an organization of this character. P. Ed Spooner, secretary of the club, has also received similar requests from "old timers" in England and France. None of the founders expected such a rapid growth of the club. One of the strongest supporters of the organization is W. C. Durant.

MOTORS METAL PLANT FIRE

Fire caused damage estimated at $50,000 at the plant of the Motors Metal Manufacturing Company, Detroit, last Saturday afternoon. The origin was not discovered.

IN PRODUCTION MAY 16

Announcement is made that the Howell Foundry Company, Howell, will go into production for all kinds of grey iron casting work about May 16. The company is established in a new building specially constructed for foundry operation, with about 9,000 square feet capacity. Officers are: President, Charles A. Kanter; vice-president and general manager, F. T. Schreiber; secretary-treasurer, F. T. Schreiner. Detroit offices are located at 315 Murphy building.

BENTON HARBOR C. OF C. ELECTS

W. H. Hearn has been re-elected president of the Benton Harbor Chamber of Commerce. Directors are H. U. Rapp, J. N. Klock, W. O. Trail, P. J. Mamer, D. B. Peters and Will Godfrey.

EXPORT BUSINESS PICKING UP

The Lansing Company, Lansing, reports a revival of export trade, this concern being one of the largest exporters of manufactured goods in the state. The company has just shipped 200 tubular spreaderarrows to Peru. These are of steel construction and will be used in railroad work. Some of the southern republics have begun to take contractors' supplies in large quantities. European trade is reported to be showing little change.

STATE FOUNDRYMEN'S OFFICERS

J. Bigar Lee, Grand Haven, has been elected president of the Michigan Foundrymen's Association, a new organization formed in Grand Rapids. The other officers are: W. O. Adams, Ann Arbor, vice-president; Glenn L. Orr, Lansing, secretary; E. B. Turner, Manistee, treasurer. The board of directors includes the officers and C. E. Claridge, Kalamaoo; H. J. Hartman, Grand Rapids; A. K. Hazebett, Big Rapids; W. W. Sherman, Muskegon, and E. L. Pearce, Manistee. The association will meet in Muskegon, June 14, when the organization will be completed in all departments. It is planned to have special committees on labor, welfare, technical matters and to co-operate with the engineering department of the University of Michigan.

CANADA'S TRADE WITH THE U. S.

Canada's total trade with the United States for the twelve months ended March 31, 1921, was $1,399,000,000, an increase of $133,000,000 over the total for the year ended March, 1920, and representing more than one-half of Canada's trade with the world.

Canada's exports to the United States were $543,000,000, an increase of $78,000,000 over the aggregate for the year ended March, 1920. Canada's imports from the United States were $857,000,000, an increase of $55,000,000. Thus, Canada's adverse balance of trade with the United States has been reduced from $336,000,000 in the year ended March, 1920, to $315,000,000 in the year ended with March, 1921. This would indicate the establishment of a trend toward a gradual readjustment of the balance of trade between the two countries.

E. J. WELCH JOINS HUDSON

E. J. Welch, who has been assistant advertising manager of the Goodyear Tire & Rubber Company, Akron, O., has resigned to become a member of the advertising staff of the Hudson Motor Car Company, Detroit.

Ruggles Motor Truck Co. Organized in Saginaw

It was reported in this publication on April 23 that the plant of the Saginaw Shipbuilding Company, Saginaw, had been sold to Frank W. Ruggles, head of the Ruggles Motor Truck Company, Ltd., London, Ont., and founder of the Republic Motor Truck Company, Alma.

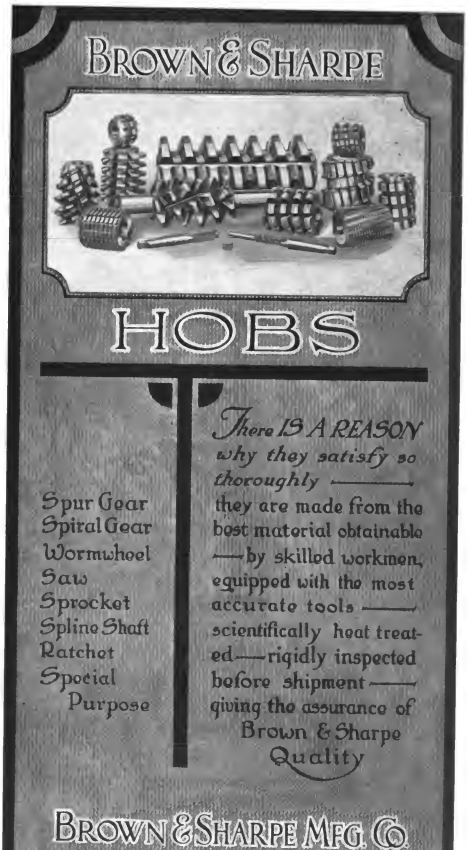
Details of the transaction, now perfected, show that Mr. Ruggles has interested a number of Saginaw business men in the organization of the Ruggles Motor Truck Company, incorporated under the laws of Delaware, and capitalized at $2,000,000. This concern has purchased the Carrollton plant of the Saginaw Shipbuilding Company and is expected to have it in readiness for production some time in July.

In the new company Mr. Ruggles will be general manager as well as president. Julius B. Kirby, secretary of the Saginaw Board of Commerce, has resigned to become a vice-president of the company. William J. Wickes, president of the Wickes Boiler Company, is also vice-president in the new concern. E. L. Smith is secretary; Walter C. Hill, treasurer; Charles T. Kerry, assistant treasurer, and John F. O'Keefe, counsel. These officers and Benton Hanchett, Henry T. Robinson, Otto L. Dittmar, all of Saginaw; John J. Thorne, Bay City, and Harry H. Price, Columbus, O., make up the board of directors.

CONDITIONS IN PONTIAC

Despite reports to the contrary men are being added to the working forces and production is being steadily increased in Pontiac factories. The Michigan Drop Forge Company reports that production is actually beyond normal. The plant is being operated twenty hours a day, with more than 100 men on the payroll, while the largest number employed in 1920 was 140. The normal number is 95. At the Wilson Foundry & Machine plant it is expected that production will be 50 per cent of capacity within another week. Business is increasing steadily. A few days ago an order for tire molds was received from the Fisk Rubber Company, Chicopee Falls, Mass., which will require probably 90 days for completion and which amounts to more than $200,000. The company, which makes principally parts for the Willys-Overland Company, Toledo, also reports increased orders from the Overland.

MILBURN LAYS OFF 400



The Milburn Wagon Company, Toledo, last week laid off temporarily about 400 of its men in the body department, due, it is said, to orders from the Olds Motor Works, Lansing, to suspend shipments of bodies until further notice. These shipments had been going forward at the rate of thirty to thirty-five a day. The Milburn Company is keeping its force of 300 men in the electric vehicle department and expects that it will be able to take back the body workers within a few weeks.

PACKARD FIVE-YEAR EARNINGS

During the first latest fiscal years of the Packard Motor Car Company, Detroit—1916 to 1920—total net sales aggregated $240,561,082, an average of $48,1112,216 a year. The net earnings after depreciation, but not before taxes and interest, aggregated $46,336,947, an average of $9,267,189 a year. The net earnings after deduction of federal taxes, interest and depreciation, totaled $28,934,308, or at the rate of $5,786,861 a year.

MASON TIRE REDUCTION

The Mason Tire & Rubber Company has reduced the price of its heavy duty cord tires twenty per cent and its other types proportionately.

ORGANIZATION PROCEEDS WELL

Organization of the Michigan Highway Transportation Association, headquarters in Lansing, is proceeding and Secretary H. H. Hardy reports general interest in the undertaking. Eligible men are being advised of the association, organized in Grand Rapids last month, and are urged to affiliate.

Plans for an energetic membership drive will be formulated at a special meeting of the board of directors to be held in Lansing May 23. It is probable that the state will be sectionalized for membership purposes at that time.

The Michigan Manufacturer and Financial Record is official publication of the state association and clears all news of the organization and its members.

17 GRAND RAPIDS ROUTES

Seventeen motor truck routes are now operating in all directions out of Grand Rapids, most of them within a forty-mile radius. Charges approximate those of other carriers, plus a small amount for store door delivery.

WILL SUPPLY TRUCK BODIES

The Lansing Bus Company has been organized by Lansing capital to specialize in bodies for all makes of truck chasses. This includes a complete line of bus furniture, panel, sedan and other types. The company has located in the Fireproof Storage & Transfer building with offices and assembling warehouse space. The business will be managed by Fred L. Waite, who is financially interested in the new company and has had a long experience in the automotive field.

ROAD BUILDING ENCOURAGED

So far this year the State Highway Department has been able to let contracts for road building at a twenty per cent reduction over costs at any time since 1917. So keen has been the competition among contractors that as many as fourteen bids have been received on one job. Since March 26 contracts have been awarded for 87.4 miles of trunk lines to cost $2,081,744.24, and since July, 1919, contracts for 793.04 miles have been let, the cost being $12,979,719.49. The Oakland county road commission will spend more than $1,000,000 on road construction this year, and much of that money on main thoroughfares.

N. Y. C. STORE DOOR DELIVERY

Officials of the New York Central railroad are examining the possibilities of store-door delivery of freight over their lines. Several experiments have been made with results that have been pronounced most satisfactory. Container cars, each capable of holding about one-fourth of a carload, into which can be loaded four smaller compartments for freight, which in turn are filled, packed and sealed by the shipper, comprise the special equipment. One of these cars has made successful trips between Cleveland and Chicago; another is being employed on the Boston & Albany railway this week. A third car, intended for handling express and provided with nine of the portable containers, has made several trips on the Twentieth Century and other fast trains between New York and Chicago.

Besides expediting movement and delivery of freight and express shipments, the new system is of economical importance to both shipper and the railway company. The expense involved in demurrage, breakage and losses through theft are eliminated practically. Furthermore the cost of packing is cut to the minimum because heavy boxes and crates are practically abolished. Goods are packed in the steel boxes without fiber or pasteboard containers in many instances.

They leave the shipper's warehouse securely locked, and when unloaded at their destination may be unpacked and the goods lifted directly to the shelves without the necessity of knocking down heavy crates.

Officials of the New York Central railway have announced that they are satisfied with the results shown by the preliminary experiments and that the system will be expanded as rapidly as possible.

NORFOLK, VA., COMPETITION

Motor bus operation in and around Norfolk, Va., has grown so large that the local street railways company finds it impossible to set aside revenue for development. The refusal of the city government to permit a fare increase and the imminence of an expiring franchise have created a transportation problem which, reports say, either will demand an increase in bus operation or elimination of the service. Reports are that the motor buses take $1,200 daily away from the street railway.

CROTHERS MAKES A CHANGE

R. A. Crothers, for some time identified with the Fireproof Storage & Transfer Coupany, has severed his connection. Mr. Crothers was one of the organizers of the Rector Transfer Company, one of the first Michigan enterprises to use motor trucks. His new affiliation has not been announced.

TRAVERSE CITY SERVICE

Reports from all over Michigan indicate the rapid development of the motor bus operation industry. Every section of the state is now using these vehicles as a complement to other classes of service and as the public is becoming familiar with their advantages, they are finding many new sources of revenue.

A new line has just been established to operate out of Traverse City. Here the chief source of revenue is freights. Motor trucks make three weekly trips with wholesale groceries and other merchandise out of Traverse City, stopping at Beulah, Benzonia, Salle, Bear Lake and Onekama. On the return trips they pick up dairy products and other farm commodities. Plans are already under way to extend the service through Frankfort, Elberta and Arcadia and to set up a regular package freight business for use of the general public.

Originators of the plan are the National Grocer Company and Northern Creamery & Cold Storage Company, Traverse City.

IN PORTAGE LAKE DISTRICT

Resumption of bus service in the Portage Lake district of Michigan with the coming of spring has tended to stimulate activities greatly. Much purchasing was withheld awaiting opening of the bus season, because of the advantages in delivery by their means. Efforts will be made to extend the season for operation as long as possible.

Port Huron—The Gratiot turnpike from Military street to the Macomb county line is now under construction, grading culverts and bridges completed and surfacing under way. The River road and Hart road from St. Clair to Muttonville afford a perfect highway to Detroit. Roads under construction include Town line, Lambs, Shea, Avoca, Beard Hill, Capac, Yale, Church, Mill Creek, North Street, St. Clair, Macomb Line, Telephone Line, Marsh and Shore.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Saginaw—April was a big month in local building. A total of 335 permits were issued, involving $879,382, or $300,000 in excess of the April, 1920, mark. The large increase was due principally to the Saginaw General Hospital permit, which figures on the list for $515,000, and to the Modart Corset Company's factory which is to cost $130,000.

Detroit—The Board of Commerce has invited the builders and building materials dealers of Detroit and elsewhere in the state to meet in a round table conference on present costs of materials and building and possible reductions in those costs to stimulate homebuilding. It is realized that if the present depression in building continues Detroit's home shortage will become more acute when industrial operations are back to normal.

Adrian—During the last month twenty-seven permits were taken out, as compared with thirty-five in April, 1920. The outlay involved last year was $46,875, while this year the total was $31,391. Of the eight permits for new buildings, three were for automobile service stations, three for private garages and two for dwellings.

Lansing—Page & Harryman, shoe dealers, will add two floors and basement to the rear of their present structure, the addition to cost about $15,000. Work will begin June 1 and

Detroit—Among the contracts awarded during the week ended May 5, as given out by the Detroit Builders & Traders' Exchange, were the following: A six-story and basement bank and office building for the United Savings Bank, in Griswold street; a bank building to house the Strathmore State Bank, in Grand River avenue; a brick and steel warehouse for the Contractors Equipment Company, to be erected on Martin and Herbert avenues; and an infirmary, a ladder house, a nurses home and a number of residences.

Among the more important items on the list of projects were a brick, stone and terra cotta branch bank building for the Wayne County & Home Savings Bank; a brick and steel theater to be erected on the West Side; an eight-family, two-story and basement apartment building; a stucco residence in Grosse Pointe; three stores and flat building, brick and steel construction; a two-story and basement, residence and garage, stone trim, to be erected in Longfellow avenue; a brick veneer, duplex apartment; a shingle residence to be erected in Bloomfield Hills, and some smaller construction.

The week ended May 7 was another "Million-dollar" week as far as expenditure for building work was concerned. The official record shows that 315 permits were issued, the cost involved being $1,087,330, as compared with $1,486,765 for the previous week and $1,284,905 for the corresponding week in 1920. There were 244 permits for new buildings and 141 permits for alterations and additions.

Lansing—In order to rush work on the new Prudden store and office building, the Rickman Construction Company has started night work, with twenty-five men on the night force and forty on the day. It is expected that all debris will be cleared away and the excavations completed within a few days, so that actual building may be begun. The footings and sidewalk walls have been put in. Steel for the reinforcement work has arrived and other deliveries are assured.

Detroit—The common council has for the third time rejected bids on the construction of the Belle Isle bridge and will readvertise. This action was taken because the Arundel Corporation, Philadelphia, declined to pare $217,000 off its bid so as to come within the maximum specified.

Royal Oak—Within a few days ground will be broken for the building to be occupied by the First State Bank of Royal Oak, at Washington avenue and Fourth street. The structure is expected to cost $210,000. The stucco structure now on the site is being moved, as well as another frame building.

Detroit—The Canadian parliament has passed the transit bill authorizing the construction, maintenance and operation of a railway and general traffic bridge over the Detroit river between Detroit and the Canadian side. Thus the last legal obstacle in the way of construction has been removed and building may begin before the end of this year, according to Charles Evan Fowler, engineer in charge of the project. The bridge, details of which were announced first in this paper last fall, will be of the suspension type, 110 feet clearance, and will cost in the neighborhood of $28,000,000.

Transportation

Muskegon—This city and Grand Haven have asked the Government to build a breakwater and make other harbor improvements. A survey of the present harbor facilities and reasons why improvements are asked have been prepared and sent to the government engineers.

Muskegon—It is estimated that Muskegon business interests will save $100,000 annually through the recent decision of the Interstate Commerce Commission by which the present favorable parity rates existing between this city, Grand Rapids and other Michigan cities and applying on shipments to and from eastern territory, are maintained, says the Muskegon Chronicle.

FISH LUMBER'S MICHIGAN OFFICE

The Charles W. Fish Lumber Company, Elcho, Wis., has opened a Michigan sales office at 616-17 Murray building, Grand Rapids, in charge of Frank S. Barnard. The company, which manufacturers northern hardwoods, operates five band mills—at Antigo, Birnamwood, Crandon, Elcho and Hiles, Wis. These mills cut 100,000,000 feet annually of hardwoods, hemlock and pine.

Purchasing Agents' Association of Detroit, offers to men the responsible buying authority certain channels of information available no where else.

N. A. C. C. Names Delegates To Oppose New Taxation

Directors of the National Automobile Chamber of Commerce, meeting in Detroit late week, decided to send a delegation to Washington, May 16, to argue before the ways and means committee of the House against further taxation on automotive vehicles, as has been suggested by Secretary Mellon, of the Treasury Department.

"What we are asking for is fair play for a great American industry," said Alfred Reeves, general manager of the N. A. C. C. "We want taxation distributed on a basis of equality, because a tax on any single industry brands it as illegitimate. We are willing to have motor cars and trucks taxed additionally if every other vehicle that runs on the road is levied upon the same as we are."

The delegates for the automobile interests are C. C. Hanch, director of the N. A. C. C.; H. H. Rice, president, Cadillac Motor Car Company, Detroit, and J. Walter Drake, chairman of the board, Hupp Motor Car Corporation, Detroit. George M. Graham, vice-president, Pierce-Arrow Motor Car Company, Buffalo, will speak for the truck manufacturers.

Advertising managers of a number of automotive enterprises conferred at the Hotel Statler simultaneously with the meeting of the N. A. C. C. directors. The outcome of the meeting was a decision to form an advertising managers' division of the national chamber. The principal speakers at this meeting were H. R. Hyman, Cole Motor Car Company, Indianapolis, and H. C. Dart, Paige-Detroit Motor Car Company, Detroit. Those in attendance were:

J. G. Cashin, Paige; W. K. Towers, Reo; J. E. Baird, GMC; A. L. Davis, Atterhury; J. E. Helm, Acme; H. R. Hyman, Cole; H. C. Dart, Paige; W. S. Yeldell, Gardner; J. E. Pickins, Selden; N. E. McDarby, Moon; R. C. Spinning, Service; H. S. Daniels, Dort; A. J. Rogers, Marmon; C. V. Burnett, Malbohn; M. H. Newton, White; Roy A. Sears, Root & VanDervoort; A. L. Chambers, Elgin; C. M. Locking, Milburn; F. B. Willis, Duplex; E. E. Hess, Sayers & Scoville; F. Carle, Standard Steel car; Albert Stoob, Schacht; E. J. Shassberger, Olds; S. R. Swiss, Republic; George W. Cushing, Hudson; Gilbert U. Radoye, Haynes; J. P. Adams, Scripps-Booth; C. P. Drysdale, Lincoln; Cliff Knohle, Liberty; V. E. Burnett, Liberty; C. S. Bailey, Peerless; Robert T. Walsh, Barley; A. B. Batterson, Buick; W. J. Mattimore, Maxwell; F. W. Munro, Hupp; L. B. Dudley, Federal; A. F. Bowman, Garford; G. J. Dwyer, Willys-Overland, and R. E. Kellar, Apperson.

GODWIN NAMED TO BOARD

The board of directors of the Grand Rapids Savings Bank, Grand Rapids, has elected Arthur M. Godwin vice-president and director in place of Frank S. Coleman, resigned.

Motor Truck on Rails Solves Hauling Problem

(*Continued from Page 8*)

are considering extending the track through the foundry and out to their core sand and coal bins. This would enable them to run the truck through and eliminate three more teams and six or seven more men, now required to handle this work.

The entire investment, including track and truck, is approximately $10,500, which will be paid for in approximately two years and two months of operation. When the remainder of the track is laid the investment will amount to $13,000 and a saving of $39.93 a day, or about $9,000 a year, will have been made possible.

DETROIT, SATURDAY, MAY 14, 1921

The German War Settlement

THE ACCEPTANCE by the Germans of the ultimatum of the Allies respecting the indemnity which shall be paid by the former as the cost of the war puts the business of world reconstruction on a new plane. The German economists have all along been maintaining that the reorganization of business within the limits of the German Republic was only possible after the terms of settlement had been defined. They have now been defined and if the obstruction to business resumption was what the economists declared it to be, it has been removed.

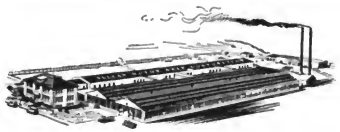
Just what the settlement means cannot be exactly determined at this time. The form which the payments shall take and the time of paying them have been pretty well set up. They involve a cash payment in gold to which the German exaction from the French in 1871 looks like a trifling bauble. This must please the French, who have not lost memory of Bismarck's rapacity when he had them on their knees more than forty years ago. At the same time the withdrawal of so much cash capital from Germany in one lump must have the effect of rendering German business very unproductive for a long time. This will in turn react upon the ability of Germany to become a consumer of foreign raw materials or fabricated product, a situation in which we, as Americans, are very much interested.

The Germans are required to support the debt which has been created as an indemnity by a substantial export tax, which has been set as high as twelve per cent. The financial and economic sides of this requirement are very interesting subjects of speculation. We in this country have been apprehensive of the tariff necessities which would equalize cheap German productivity with the products of goods made upon an American living standard. This would only be accomplished by a protective tariff, the proceeds of which would go into our own treasury. The necessity of a protective tariff for the purposes of protection is discounted to the extent of twelve per cent of the exportable value of German products by the requirements for the amortization of the war debt now created; while the condition that our treasury would be enriched by duties upon so much of these products as entered our country is changed by applying the twelve per cent to the interest and principal of the war debt. Now it is not conceivable that these items will be paid in money. They must be paid in goods. These goods constitute the basis of profitable trade. Most of this debt is due to France and England. They are, therefore, setting up new trade conditions of profit to themselves and their people. Inasmuch as we are not participants in the indemnity, thanks to the altruistic position taken by President Wilson, the Frenchmen and Mr. John Bull have, to the extent that the condition under discussion operates, put one over on us in a trade way. It is true that they, too, owe us money, the payment of the interest and principal of which are to be made in the same way. But the fact is that they get the goods first. We may get them at second-hand, and in an advanced state of fabrication. It was this situation, no doubt, that the Germans had in mind when they made a tentative proposal to the United States to take over and become responsible for a portion of the Allied debt to the United States. In that event we would be getting their available raw materials at first-hand. It is not impossible to imagine that a regular interest and principal payment to this country, say in potash salts, would be a mighty fine thing for us to be enjoying. It might be more valuable to us than either English or French gold or goods.

The Germans have had imposed on them an impressive industrial slavery, which, at the least, will bear upon them as a burden for a generation. Yet this is only the penalty for injustice, for which they are entitled to no sympathy.

Price Control by Manufacturers

REP. KELLY'S standard price bill—a measure designed on the one hand to protect manufacturers against price slashing by unscrupulous retailers, and on the other to put an end to some of the rampant profiteering of which some dealers have been and continue to be guilty—has been reinstated in the House of Representatives. Mr. Kelly will make an effort to put it through during the present session.



This bill, which has been indorsed by the National Association of Manufacturers, the American Fair Trade League and most of the state associations of manufacturers, retailers and wholesalers, permits independent manufacturers with registered trademarks to print on the packages containing their product the price at which it is to be sold. Retailers selling the goods at less than the quoted price would be subject to punishment. The measure thus acts to protect the manufacturer's good will, which now is put at the mercy of the buccaneer bargainers who cut standard prices and set up "misleaders" to deceive the public.

Moreover, it protects the purchaser. When in one establishment one may purchase a tube of tooth paste for twenty-five cents but in the store next door be forced to hand over thirty or thrity-two cents; when in one block one may buy a can of standard brand tomatoes for twenty-eight cents but in the next block be obliged to hand over thirty or thirty-five cents for identically the same article, it is a "dead open-and-shut case" of profiteering, other factors being equal. If the retail price were printed on the package the customer would have no one to blame but himself if he paid more than that.

Safeguards both for the public and the retailer are furnished One clause of the bill provides that if anyone believes the manufacturer's price too high he may appeal to the Federal Trade Commission, which, after investigation, may revoke the right to fix the price but may not substitute another. On the other hand, a merchant going out of business and who therefore may wish to conduct a sale is afforded opportunity to offer to sell the goods back to the manufacturer at the price he paid for them. If the maker does not wish to take them back the dealer may sell at any price he likes.

The bill deserves serious consideration.

Join Hands with these Master Axle Builders

THE Vulcan Motor Axle Corporation started new one year ago. Its officers and executives knew how to build axles and they planned a better axle. Of the money needed to get into production this group supplied one-third; the rest was subscribed by bankers and successful business men, their personal friends.

Their dream of making a better axle has been realized, and they stand now at the threshold of that period in their career which should mark their most profitable development. They are anxious that those who go through this period of profit with them should be of the same high standing as those already associated with them.

You can ally yourself with the future of these men and their business. You can become affiliated with them now when their opportunities for multiplying the values of their business over and over again are the greatest—when your opportunities are on a par with theirs.

Investigate this opportunity to become a partner with these master axle builders.

Wallace Injunction Decision Taken Under Advisement

By H. BOND BLISS

[Staff Correspondent, Michigan Manufacturer and Financial Record]

LANSING, May 11—Hearings on the injunction proceedings of A. W. Wallace & Company, Detroit, against the Michigan Securities Commission were held before Judge Leland W. Carr in the Ingham circuit court here, Tuesday, May 10. The company seeks to make an injunction permanent preventing the Commission from suspending the license of the brokers as the result of selling some "free stock" of the Michigan-Colorado Copper Company, while the Commission asks the court to dissolve the injunction so it may proceed against the Wallace company.

Morning and afternoon sessions completed the hearing. Most of the time was devoted to the evidence presented by A. W. Wallace and W. J. Peoples for the brokers and H. N. Duff, executive officer of the Commission, for the Commission. Attorneys Clark, Emmons, Bryant, Klein and Brown represented the Detroit firm, while Assistant Attorney General S. F. Master appeared for the Commission. At the close of the hearing late in the afternoon Judge Carr announced that he would take the case under advisement and would announce his decision within a few days.

The evidence and arguments presented by the witnesses and attorneys for A. W. Wallace & Company tended to show that the Commission had granted the Michigan-Colorado Copper Company permission to sell 975,000 shares of stock, put 1,500,000 shares in escrow with the Commission, while leaving 500,000 shares free stock with the Wallace company, to be used if necessary for promotion purposes. They claimed that the Commission by its action gave approval to the stock itself, authorized the sale of the amount named and understood that the free stock was to be disposed of if required, and that it had no authority to deny the sale of this stock held by Wallace unless at the time of the original hearing the Commission had cancelled or ordered this stock placed with the other in escrow. Wallace claimed that insufficient notice was given the firm of the impending action of the Commission in threatening to suspend the broker's license, and in order to protect the company hasty moves were necessary to obtain protection, which was granted by Judge Howard Wiest, of the Ingham circuit court, June 29, 1920.

The Commission by its witness and attorney declared that no authority had ever been granted for the sale of the free stock, that the permit for the disposal of the 975,000 shares did not include an additional half million, that no resolution was hurriedly passed by the Commission to suspend the Wallace license, that proper notice was given for a hearing and that the restraining order should thereby be removed so the Commission could proceed to take what action was deemed proper.

Technical details involving the entire transaction were covered comprehensively during the hearings, while the report of the original appearance before the Commission for permission to sell the stock was also recalled. In this was brought out the questions and answers regarding the copper company. At that time Augustus C. Carton, president and original promoter, appeared before the securities commission, of which Attorney General, now Governor Groesbeck, was a member and took an active part in the questioning. This report showed that the company was willing to place the 1,500,000 shares in escrow with the Commission and that it was understood 500,000 shares of free stock were to remain out to be used if necessary. In face of that statement, Attorney Emmons contended, the Commission did validate 975,000 shares for sale.

Mr. Wallace while on the stand related the full history of the case. He said about half of the free stock had been sold, although it was declared 375,000 shares of this stock had been disposed of, a total of about 679,000 shares in all having been sold of both the authorized and free stock. In regard to the copper mine, he said that while conditions at present are not bright, no one, not even an expert engineer, could or would say that there was not paying ore there if properly developed.

To uphold the contention of the Wallace company Attorney Emmons cited a number of other cases which, he claimed, showed that Wallace had a right to dispose of this free stock under the permission granted.

In closing his case Mr. Emmons read the notice sent to the A. W. Wallace & Company on June 18, 1920, asking that firm to explain its sale of the free stock and stating that a resolution was proposed to suspend its license. He said that such a letter was not a proper notice and was not a statement of charges. Wallace, he declared, had no intimation that his sale of the stock would be regarded as improper previous to this time, he had been given no warning and supposed that in view of the Commission's approval it was right to dispose of the stock in the promotion plan. The first word he received of the opinion of the Commission was this letter, setting forth that it regarded the sale of the 375,000 shares as illegal and calling upon him to turn the proceeds received over to the copper company. In other words Wallace was told, he said, that his license would be revoked unless he paid for property which did not belong to the copper company. He was not granted a fair and open hearing, he thought, but was informed that the transaction was illegal, and was suddenly called to answer the charges. Such a move, he contended, was illegal and indefensible. And so he sought and obtained the court order to prevent this step by the Commission to ruin his business, and now he asked that the order be made permanent.

Now as to the legality of the stock, Mr. Emmons said, the Commission validated certain stock out of the treasury but did not require the free stock held by older clients to be placed in escrow or suspended. Then how could the Commission later have authority to put stock of the same company held by the public in two sets, one legal and right to sell, the other ill legal and criminal to sell? How would a purchaser know which stock he was buying, legal or otherwise? The Commission must either validate a stock or not. But knowing that this free stock existed in the hands of another, the Commission still gave its approval to this security of the Michigan-Colorado company, being asked that the 500,000 shares be kept free so it could be used if necessary to help put the entire deal across. With that statement made at the hearing, the Commission left the stock free, stock owned by Mr. Carton and then the Wallace company. The Commission was asked to validate 975,000 shares, and if it did not want any more than this sold, it could have ordered the 2,000,000 shares placed in escrow.

Here Judge Carr interrupted with a query: "Then you considered when the Commission validated 975,000 shares, it also validated the 500,000 shares of free stock?"

"Yes," replied Emmons, "for how could the public tell which was which—which stock was authorized to be issued or which was already out." The Commission had either to cancel this stock, place it in escrow or permit its sale."

On such a condition A. W. Wallace & Company were entitled to a fair hearing before an impartial tribunal. This it was not to be granted. The tribunal had already decided, the company had no time to prepare its case, it was compelled before the hearing.

Attorney Master in outlining the case for the Commission said: "The Commission had not passed any resolution to suspend the license of A. W. Wallace & Company, nor had it said it would. Chairman Frank W. Merrick had introduced such a resolution and told Wallace it would be passed, but he was not the Commission. Wallace was informed action would be postponed and he would be given a hearing on June 29, 1920. Thus the claims of Wallace are unsubstantiated. Wallace is guilty of selling stock which had not been approved. If his contention is upheld, then while the Commission approved the sale of 975,000 shares only, Wallace could in reality sell much more than a million shares. Suppose the Commission would authorize the sale of only 25,000 shares of a stock. Then could most of the rest of stock held by outside parties be shipped into Michigan and disposed of? But we don't believe the law would permit any such action."

"But the stock in question did not belong to the applicant for permission," interjected the judge. "You believe, then, that no stock could be sold except by the express authority of the Commission?"

Attorney Emmons declared that the Commission must change its method, and must understand that when a company is approved, what stock not cancelled or placed in escrow can be sold.

With these final general statements by the attorneys, the case was closed and the judge promised an early decision on the matter. Should the Wallace contention be upheld, the present temporary injunction against the Commission will become permanent and A. W. Wallace & Company will be permitted to continue business as in the past. Should the injunction be dissolved, then the Commission will be able to take up consideration of the case, call Mr. Wallace for a further hearing on the matter, and if it believes evidence warrants, revoke or suspend the Wallace license as stock brokers.

COMING GROUP MEETINGS

Bankers in northwestern Michigan will meet May 17 at Traverse City to hold the spring group meeting of that district, while members of the southwestern Michigan Banker's Club will hold their spring meeting at Allegan, Thursday, May 26.

DIRECT WIRE CONNECTION

Phipps, Williams & Beeson, Saginaw, investment bankers and brokers, who recently became members of the Detroit Stock Exchange, have obtained direct wire service between their Saginaw office and the principal exchanges by a correspondent arrangement with Merrill, Lynch & Company.

Quotes by Allen G. Thurman & Co., May 3.

When Peter Grimm Returned

You know the story of Peter Grimm—

—how he lived, died and, as the story goes, returned in spirit form to his old home and his loved ones.

How he found upon his return that plans made for others during his life were going wrong.

Yet how helpless he was to set them right.

He could only watch and suffer.

Unlike Peter Grimm, you still have an opportunity to insure, to a great extent, the future happiness of those dear to you.

You can make many provisions in your will that will eliminate confusion, and perhaps heartaches, in the settling of your estate when that time comes—perhaps suddenly.

And you can safeguard the future even more surely by choosing wisely the executor of that will—

—choosing with the same care that you would use in any affair requiring good business judgment.

—choosing as you do now for the best interests of your business and your family.

The Union Trust Company is empowered by the state to act as executor of wills.

Its experience, resources and facilities are centered on such exacting work.

The cost to your estate is low and is limited by statute.

We will send you literature on wills and executors or we will tell you the facts personally at your request. Write or phone us.

Banks and Bankers

STATE EXAMINERS' BANQUET

State bank examiners from all sections of Michigan were in Lansing, Friday evening, May 6, for a banquet in honor of Frank W. Merrick, retiring state banking commissioner, and the new commissioner, Hugh McPherson. Tribute was paid Mr. Merrick for the manner in which he had conducted the office for six years and regret was expressed at his departure. However, Mr. McPherson was recognized as a banker of experience and the same harmony of relationship as has existed was pledged for continuance.

McCONNELL SPEAKS IN LANSING

R. M. McConnell, vice-president of the National Bank of Commerce, Detroit, in an address before the Lansing Buyers' Club last week blamed the retail merchant for the tight money situation and delay in return to normal conditions, because he had failed to cut prices to conform with the reductions made by the wholesalers and producers.

TWO PONTIAC BANKS MERGE

Through the merger of the Pontiac Commercial & Savings and the Oakland County Savings, Pontiac will have a million-dollar bank as well as one of the largest banks in the state outside of Detroit. The merger is to be completed May 31, and Cramer Smith, president of the Pontiac Commercial & Savings Bank, will be president of the new institution On January 1, 20, the Pontiac Savings Bank, capital, $500,000, and the First Commercial Bank, capital, $200,000, were merged into the First Commercial & Savings Bank. The absorption of the Oakland County Savings Bank brings the third bank into the union. The Pontiac Commercial has deposits of $9,261,-877.74; the Oakland Bank, $2,051,257.55. For the time being two banks will be operated, but eventually a new bank building will be constructed and the three united under one roof.

GORMAN TAKES NEW POST

Frank E. Gorman, state treasurer, has assumed his new duties as cashier of the Capital National Bank, Lansing, succeeding Robert Y. Speir, who was promoted to be manager on the death of Fred C. Wherrett.

STATE BANK OF MERRILL

The State Bank of Merrill reports total deposits, April 28, of $592,902. R. T. Maynard, cashier of the Commercial National Bank, Saginaw, is president and John R. Duffy is cashier.

BANK OF DETROIT LISTS STOCK

The $1,000,000 capital stock of the Bank of Detroit was listed on the Detroit Stock Exchange, May 9. The dividend record is as follows: December 31, 1917, 1½ per cent; 1918, 8 per cent; 1919, 10 per cent; 1920, 10 per cent; present rate 10 per cent.

McCLISH SUCCEEDS CHAPPLE

V. L. McClish is the new manager of the east side branch of the National Union Branch, Jackson, having succeeded L. D. Chapple, who

Digitized by Google

resigned to manage the Jackson office of Webb, Lee & Company. Mr. McClish was for four years with the Central National Bank, Battle Creek; one year with the City National Bank, Lansing, and has been in the main office of the National Union about three years.

PRIVATE BANK CLOSES

The Farmers & Merchants Bank, Jones, Cass county, a private bank operated by Jones & Stanard is closed. Walter C. Jones was president.

NEW EATON RAPIDS QUARTERS

The Michigan State Bank, Eaton Rapids, has purchased the Vaughan block, at Main and Hamlin streets, and will make changes and improvements and occupy part of the premises. The bank was organized in 1884 and its resources are $700,000.

CHARCOAL IRON REPORT

Following is the annual report of Frank W. Blair, president of the Charcoal Iron Company of America, as submitted to stockholders at their meeting in Detroit last week:

"As indicated in our report for the year 1920, the net profits for the first nine months of that year amounted to $1,202,828.59. For the last quarter of 1920 the business situation throughout the entire country became so thoroughly demoralized in all lines as to cause us a loss of $157,264.94 for that period. The first quarter of 1921 has shown very little if any improvement in the market for iron, chemicals or lumber, and the statement hereto attached accordingly reflects the dull business situation by showing a lose of $86,845.66, which is a considerable reduction from the loss sustained in the previous quarter, and brought about largely through reductions in overhead expense.

PRODUCTION

"The total production and the quarterly average for the year 1920, as well as for the production for the first quarter of 1921, are shown in the following table:

Product	Total 1920	Quarterly Average 1920	First Quarter 1921
Pig iron, tons	92,456	23,564	14,474
Alcohol, gals.	1,129,518	382,379	234,022
Acetate, lbs.	16,784,836	4,196,209	1,346,226
Lumber, ft.	12,378,754	3,069,688	.....
Ore, tons	348,007	87,001	54,167

SHIPMENTS

The record of shipments of products for the year 1920 and first quarter of 1921 is set forth below:

Product	Total 1920	Quarterly Average 1920	First Quarter 1921
Pig iron, tons	75,459	18,864	4,661
Alcohol, gals.	576,534	144,133	57,573
Acetate, lbs.	7,948,626	1,987,156	2,306,512
Lumber, ft.	5,849,656	1,467,414	974,365
Ore, tons	337,035	84,256	31,159

"These figures point most accurately to the extent to which the business depression has affected the company. In our last report we mentioned that only the Manistique and Ashland chemical plants and furnaces, with the Yale mine on a limited scale, were being operated. Since that time both Ashland and Manistique operations have been entirely discontinued and the only point at which the company now is at all active is at the Yale mine, which is being operated on part time for the purpose of carrying out our ore contracts.

"For the convenience of stockholders a comparison of the principle items in the 1920 and present balance sheets is presented.

ASSETS	Dec. 31, 1920	March 31, 1921

Michigan Bond Items

The common council of Hillsdale this week authorized the issuance of $35,500 of municipal bonds, known as "Hillsdale Paving District No. 2" bonds for the improvement of Hillsdale street. The work is being done by the Asphalt Paving Company of Hamilton, Ohio. The bonds will be issued in two sets, the first twenty-five in the sum of $500 each, due on May 15 of each year as follows: Nos. 1-5 in 1928; Nos. 6-10 in 1929; Nos. 11-15 in 1930; Nos. 16-20 in 1931; Nos. 21-25 in 1932. These bonds and interest are payable out of the pavement, interest and sinking fund of the city.

The second set comprises forty-six bonds covering the part of the cost of the improvement to be borne by the property benefitted and will be termed as follows; Nos. 1-9 payable May 15 1928; Nos. 10-18 in 1929; Nos. 19-27 in 1930; Nos. 28-37 in 1931 and Nos. 38-46 in 1932.

Both sets are negotiable coupon bonds bearing interest at the rate of six per cent, payable semi-annually on May and November 15 of each year until maturity.

Watling, Lerchen & Company, Detroit, are offering an issue of $1,250,000 of first mortgage, 10-year bonds of the Eddy Paper Company at 98¼, to yield 7.75 per cent. These bonds, a complete description of which will be found in the advertising columns of this issue, are a closed first mortgage on property said to be worth nearly five times the amount of the loan. The Union Trust Company of Detroit is trustee. It would appear from the description that the bonds would qualify as savings investments for Michigan savings deposits.

By a vote of 358 to 48 taxpayers of the village of Ford voted Monday to issue water works extension bonds for $37,919 for the purpose of connecting up the water system of that village with the filtered water system of Wyandotte. The city of Wyandotte has entered into a contract with Ford Village to furnish filtered water for a period of years. Heretofore Ford water, which was pumped from the Detroit river, was the cause of giving the village the highest typhoid death rate in Michigan, according to the State Board of Health Bids will soon be advertised for for the sale of the bonds.

A few days ago the city controller of Saginaw put on sale $100,000 of sewer bonds and $100,000 of street improvement bonds, dated May 2 and bearing five per cent interest. Sales the first day totaled nearly $50,000.

Voters of Corruna have decided in favor of authorizing a bond issue of $9,000 for paving purposes.

The state administrative board has announced that $3,000,000 of highway improvement bonds will be sold June 1, for which State Treasurer Gorman will receive sealed bids until May 25. Bonds will be in denominations of $1,000, dated June 1, 1921, due June 1, 1941, and bearing interest at 5½ per cent. A certified check for one per cent of the amount of each bid, payable to the treasurer, must accompany each offer. This issue will bring the total highway bonds outstanding up to $10,000,000.

The Dowagiac school board is sounding sentiment for a $400,000 bond issue to meet school needs declared to be urgent. Mass meetings are being held and the board has offered one of four plans. A high school, the most pressing need, may be built at once, according to D. H. Perkins, Chicago architect. Unless taxpayers indicate they will build to the extent of $200,000, the unit plan cannot be put into execution. If the mass meetings indicate a

new school as the need, the bond issue will be voted upon at a special election.

Lowered building costs have spurred the school board of the Rockford district to action relative to the erection of the new high school building, for which bonds of $70,000 were authorized in 1919. Bids submitted several months ago clung close around the $100,000 mark, but recently an estimate has been received for the erection of the building at $85,000. Acting upon the hope that still further decreases will come, the board called a special meeting Monday evening, at which time they were authorized to sell the bonds at a rate not exceeding six per cent, serially, the first falling due in five years and carrying the privilege of refunding at the end of the period of fifteen years.

Plans are being worked out for the placing of concrete pavements over at least four blocks of the village streets of Rockford during the present year. These streets will be full width, curb to curb, and will doubtless be paid for by an issue of bonds which will be called for at a later date.

A special meeting was held recently which was attended by the township boards of Algoma and Plainfield townships and the village council of Rockford, at which time the road west of the village to three-corners of a mile was ordered placed on a state reward basis, and when accepted by the county road commission, it will become a part of the county system. Both township and the village will share equally in the expense.

The Jackson City Bank has purchased at par a $400,000 Jackson county bond issue authorized by the supervisors at their recent session.

Bids on $100,000 of Sault Ste. Marie waterworks bonds, refunding a portion of an old issue, will be opened by the city commission June 6. The bonds are to expire serially, $10,000 each year for ten years. The issue is to take care of the unredeemed portion of a $120,000 waterworks bond issue of twenty years ago. Of the bond issue, $4,000 was lifted last year and $16,000 is being taken up this spring by cash on hand, leaving $100,000 which must be refunded.

Electors of Houghton county will vote June 7 on the question of bonding the county in the sum of $200,000 for highway improvements. The proposed bonds will run 20 years, the paying interest at the rate of 5½ per cent. A provision will be adopted, in event the issues carries, to retire the bonds in less than ten years by the payment of a premium, probably one-half of one per cent for each year the bonds are yet to run.

The voters of the city of Hancock, Houghton county, will vote June 7 on the question of bonding the city for $650,000 to take it over a period of financial stress.

ROAD BIDS CLOSE MAY 18

CHEBOYGAN, May 10.—Bids have been advertised for by the county road commissioners for the paving of Mackinaw avenue from Main street to Smith's Creek, a distance of a mile. Specifications call for a 32-foot concrete pavement. The state highway department will construct a 20-foot concrete road over this distance, the city being asked to furnish $12,800 to construct the additional twelve feet. Bids close May 18.

RUDY FURNACE ISSUE OFFERED

The Rudy Furnace Company, Dowagiac, is offering investors $175,000 of its eight per cent preferred stock as a part of a $325,000 issue the stockholders sanctioned to carry out plant extension.

Stockholders at a recent meeting voted to capitalize at a million dollars and the Michigan Securities Commission authorized a $650,000 issuance, of which $325,000 is common and $325,000 preferred. Common stock owners of December 31 inherited the common stock.

The stock issue was voted to build a warehouse. The company, like other furnace concerns, is feeling the business depression, but is going ahead on the theory that normalcy is near at hand. They are making stoves and furnaces, but are without room to store them. Dowagiac warehouses are filled to the overflowing and the big factories of the "stove city" have redneed forces, but will not close down entirely.

A Symposium on World Trade

(*Continued from Page 5*)

its work that all diplomatic matters shall be promptly passed on to the State Department. At the same time, if the department is to serve properly the best interests of the country, there must be perfected means of demand to insure not only the gathering but the dissemination of information of value to the business world while it is still fresh and without allowing it to become subject to the channels of diplomacy for consideration."

The Third Problem

Third on Mr. Taylor's list of problems is exchange, regarding which, he says, there is a grave misunderstanding among Europeans. Here we come upon one of the paradoxical international viewpoints. One minute Europe declares the United States a nation of braggarts, boasting of powers we do not have, and the next minute we are charged with being a nation that can do anything it wants to when it wants to, and one of the things it could do if it wanted to is take the profit out of the exchange rate. Mr. Taylor said:

"How are we to make our European friends understand that the collapse of exchange is simply the barometer indicating what is going on in the financial relations of the nation and nation? The disturbance of exchange stands in the way of normal commercial relations between America and Europe. It creates a barrier that makes it difficult for our foreign customers, whose needs are very great, to receive and to pay for our products.

"As a result of several visits I have made recently to my European friends, I find many of them disposed to regard the abnormal exchange rates as something for which we Americans are responsible. They cannot get away from the idea that when we insist upon settlements in dollars we are making additional profits out of the transactions. Some have even said that if we were friendly enough and clever enough we could find a way by which they could escape this drain on their resources.

"I sometimes think it is inbred in the ordinary Frenchman's mind that we manufacturers in this country are actually getting three times the profits on our products sold in France as compared with the profits on the same products sold in the United States. This psychological misunderstanding is a heavy drag on the export business and particularly affects the buyer of those goods that, in a measure, are actually non-competitive. They want them because of their individual character; because they are better than goods made elsewhere; because they represent the development of American genius; but in their souls they believe that they must be charged, and it requires the calm reasoning of our ablest men to bring home to them that our goods cost us dollars, and that they must be paid for in the full equivalent of dollars. Our foreign friends must expect to pay enhanced prices in their own currency, because it is a fact that the conditions arising out of exchange are matters beyond our control.

"All this is dwelt upon because we must realize that we have a responsibility to see that we are not misunderstood. A regard for the decent opinion of all mankind is most important and, so far as we can make ourselves heard, we ought to clear up all misunderstandings that reflect upon our country.

As to Credits

Probably the most vital issue under consideration in the convention was extended credits. It was fourth among Mr. Taylor's problems. His brief remarks on the subject were as follows:

"Since our customers need our goods today, and cannot pay for them tomorrow or the next day, how shall we sell them on long-time credits? They have a right to ask for long credits because it is a fact that we have become a creditor nation and ought to be able to give them financial assistance. It will be a reflection on us if we as manufacturers and our friends in the banking business cannot get together and establish sound machinery for international trading. No matter how good the credit of customers may be, there are few

Digitized by Google

manufacturers in this country who can afford to finance exports upon short-term paper bearing their own indorsement. The difficulty is that such extended credit is a mere temporary bridge to enable our customers to buy what they cannot pay for now. It is a bridge to carry the load until the balances in foreign trading right themselves.

"Frankly, there is no one suggesting such a temporary bridge unless there is under construction a permanent bridge with solid abutments at both ends. There must be an adequate plan prepared and under construction based upon the reasonable determination that there is to be balance in trade with a reasonable time.

"As stated above, foreign business is not to be done by chance and foreign credits are not to be granted by chance. We are in fact a creditor nation, therefore it is our responsibility that a stabilizing plan, a permanent bridge shall be built up by co-operation between our bankers and our manufacturers. Maybe as two classes of citizens we do not know each other well enough even to talk together intelligently, but we ought to try jointly to formulate the basis by which our power to extend credit can be used effectively. An impoverished or improvident customer in America or in Europe is an undesirable one; but an honest, competent customer, temporarily short of funds, is an anchor for the future, once we find a way to serve him. I do not hesitate to suggest that if we can harness our powers intelligently, we can establish this relation with our foreign friends."

At the second general session, Wednesday, George R. Meyercord, president of the Illinois Manufacturers' Association, delivered an address on the "Value of Long Credits to the Exporting Manufacturer." He said in part:

"As I view the Edge law foreign trade financing machinery, it offers the first step whereby the manufacturer gets some reasonable measure of relief toward creating that highly desirable, stabilized situation whereby his frozen inventory is rendered more liquid.

"Every day American manufacturers are being offered profitable European business that they reluctantly are obliged to decline because this country has lacked the foreign trade financial machinery that has been developed so successfully by Great Britain.

Speaking in American Dollars

"The Foreign Trade Financing Corporation through its debentures speaks in American dollars to the American investor, and the American investor need only have faith in the vast capital of the corporation and in its management. It is unthinkable that the management will not be both able and of a superior order.

"From the standpoint of the manufacturer investing a reasonable amount in this enterprise," continued Mr. Meyercord, "I draw the following conclusions as to profits. Let me illustrate by example:

"Take the case of a manufacturer doing $200,000 exporting annually. Grant his profit is 15 per cent net on his sales. Fully one-half to two-thirds of his tenders of orders at this time require long time, which he has not been in the habit of granting. He is, therefore, turning down orders daily. Assume that only one-half of his prospects die by virtue of his inability to finance. That represents a profit of $15,000 that he is losing. Surely, such a manufacturer can afford to invest $10,000 in the stock of a corporation that will make it possible for him to earn $15,000 within a year."

The Edge Law banking machinery, of which Mr. Meyercord spoke, was discussed at length by Philip B. Kennedy, vice-president of the First Federal Foreign Banking Association. There are two such organizations, the second one being the Federal International Banking Company, New Orleans. Mr. Kennedy said that his observations of the workings of the bank during his association with it had confirmed his belief in its value. A ruling of the

ARTICLES that have to *fit* can't be bought from a list. Lead-pencils, cook-stoves, plows and other standardized goods can be bought that way and will likely give satisfaction. But you wouldn't buy a pair of shoes or a suit of clothes merely because they appeal to the eye and the price is right. You want them to *fit* you.

Bonds must *fit* their purchaser. First, they must fit in price, in yield and in maturity. Vastly more important, they must fit the savings plan most applicable to your own needs—financial independence at a given age, saving for a known future expenditure, or some other clearly defined purpose to be accomplished.

The direct road to a financial objective is traveled comfortably and without worry by those who plan their way and then buy their bonds to fit that plan. If you have your plan in mind, we will suggest the bonds to fit it. If you have no plan, we shall be glad to devise one for you when we know your needs, also to suggest some of the desirable and appropriate investments in the present bond market.

Our pamphlet, "Prices and Values," lists some of these bonds. Send for it. When you read the pamphlet and give us an idea of your needs, we can tell you the best bonds for you to buy—to fit you.

Federal Reserve has established two classes of foreign trade banks, acceptance and debenture. One bank cannot handle the two kinds of paper. Mr. Kennedy said the proposed $100,000,000 foreign trade financing corporation would be a debenture organization. An extract from Mr. Kennedy's address follows:

"That there is a special field for Edge Law banks in making commercial credits for from three months to twelve months is evidenced by the fact that leading commercial banks have recently referred this kind of business to Edge Law banks.

How Much Time Is Necessary?

"There is a reasonable amount of business offering in this zone of three months to a year. American exporters find that there are special conditions which justify credit to their foreign customers of this period. Our producers have the goods stored here or they can produce them. It may be a question of cutting down the working of a plant twenty-five, fifty or 75 per cent capacity, or of extending larger credits to foreign buyers. There may be no question that the American goods are needed abroad. The foreign trade connections may be experienced and the moral risk first class. Payment will be possible when the exported articles have been turned into money.

"Not all foreign business should carry three to twelve months financing by the American shipper. A large portion should be for under ninety days and plenty could wisely be done on long terms such as three, five, ten or even twenty-five years. There is, however, a material amount of foreign business which is logically suited on economic grounds to the period of three to twelve months.

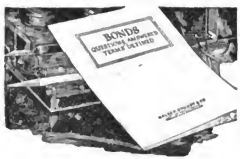
"Credits should be as short as possible. There are, however, cases where longer credits are good business and other cases where it is either longer credits or no business. It is poor policy to take shelter behind slogans or excuses. This is preeminently a time when individual transactions must be worked out for the present, and let us not forget for the future.

"The very fact of specialization should give these banks a certain skill. Take, for example, cotton. The two Edge Law banks have together worked out a method of financing the export of a certain amount of low-grade cotton to Europe. Shipments have been made. Further plans are being worked out to move some more of the southern cotton to the other side on a sound credit basis. National and state banks encourage this special attention to meeting a problem of general importance."

Letters of Credit

In connection with foreign trade financing, the place of commercial letters of credit was considered by Wilbert Ward, New York Bankers' Commercial conference, who mentioned the plans now being made for a standard, uniform American letter of credit. This work is being done with the help of the divisions of analysis and research of the Federal Reserve Board, American Bankers' Association, American Acceptance Council and the National Association of Credit Men. Mr. Ward said:

"Naturally no form of commercial credit instrument, however well conceived, can overcome the human element and it seems important to keep always in mind that a commercial credit is primarily an instrument of finance. It is only in an incidental way that it can operate to protect the buyer from an unscrupulous seller, and banks never can, and properly ought not, undertake to check documents so carefully that the buyer is relieved of the duty of selecting his seller with care. However, I think you will agree with me in believing that some such forms as those proposed will go as far as rules and regulations ever can go toward ending commercial credit disputes, for these forms are calculated to end the misunderstandings which create disputes."



Referring to legal decisions on controversies arising out of commercial letters of credit, Mr.

Ward said: "The courts will undoubtedly abide by the testimony of men like yourselves as to the business practice and customs. It is in your hands, therefore, to say what the custom, and eventually the law, will be, and the banks will accommodate themselves to that decision. I repeat, however, that you cannot expect to have one custom and one law for exporters here and another custom and another law for importers there. If you finally decide that you have fulfilled your obligations to foreign buyers by delivering merchandise on a dock and calling it a shipment, then you must expect to have sellers abroad take the same attitude toward American merchants when they become buyers. If you feel that you do not want to receive such treatment when you import, then it would seem advisable to go on record immediately as saying that you do not intend to give such treatment to foreign buyers as exporters.

"I repeat that the banks can accommodate themselves to any settlement you may desire to make of the question. It seems obvious, however, that for the protection of merchants and bankers here and abroad the question should be settled in one way or another without further delay, and I commend it to your organization for careful consideration."

While admitting that theory teaches that exports and imports ought to balance, Mr. Taylor, discussing trade balance as his fifth problem, declared it was useless to expect such a balance for a long time under the conditions now existing in Europe. He drew an illustration from England, which, as a creditor nation, has wealth invested in all parts of the world. So much money had been loaned in South America that she drew foodstuffs and other imports in quantity nearly enough to take care of her home needs; and they were paid for by the earnings of the investments planted near where the crops were grown. The records of a recent month show English imports divided in the following proportions: One-half, foodstuffs; one-fourth, raw materials; one-fourth, manufactured articles.

These proportions, Mr. Taylor said, made it obvious that exports of manufactured goods from England were inadequate for balancing trade. The rest of Europe, he said, needed enormous quantities of foods and materials from the United States, calling for huge sums of money, which cannot be balanced by manufactured goods from Europe.

"As we are a creditor nation, and if we mean to do an export business, it seems clear that the first step is to create a broad foundation of invisible imports into the United States that will hold one abutment of our permanent bridge," Mr. Taylor said. "The only way this can be managed is under the guidance of our great bankers, who today can sell millions of securities within twenty-four hours for the requirements of any domestic corporation. Our bankers can count upon eventual relief through a gradual growth of imports, because our people have always shown a disposition and willingness to buy freely the things that represent the genius of other countries, to pay good prices for them and also a reasonable duty to add to our government's budget and to equalize part of the difference in international wages. Under a proper tariff, importations will increase, but not nearly fast enough to meet the requirements of the day. Foreign securities must be marketed here."

War As a Factor

Mr. Taylor's last problem was war, which is fundamentally the great credit risk, he said. He urged limited armaments. "European credit," he declared, "hinges finally upon some actual, satisfactory assurance that another war is not to occur. This is not politics. Our country, notwithstanding the ground lost, still may lead the world away from mutual distrust and hatred by arranging for practical and actual disarming. Sooner or later a demand of this character will come from all parts of the country, so we, as credit men, can lend our voices without any risk of doing harm."

The commission houses and their functions in foreign trade were discussed by two speakers, W. E. Peck, New York, and F. W. Lincoln, of Henry W. Peabody & Company. The sum and substance of their remarks was that the export commission houses undertake to supply the deficiencies under which export manufacturers are now laboring, and that they not only centralize the export efforts of many small manufacturers but finance exports and furnish the trained staffs which both the Government and the manufacturer have lacked.

The technique of advertising for foreign trade and in foreign countries was discussed by Elmer H. Allen, of the President Suspender Company; A. B. Cole, publicity director of the Westinghouse Electric International Company, and Frederick Dickinson, advertising manager of the Hupp Motor Car Corporation, Detroit. Mr. Dickinson's address was a recounting of some experiences in foreign advertising, all tending to show the danger of an American manufacturer's trusting the preparation of advertising copy for his products to foreign copy writers who do not know the technique of such advertising nor the character of the product advertised.

Packing for foreign shipment, insurance, the situation in the Far East, and the influence of foreign trade on agriculture were other topics. C. C. Martin, National Paper & Type Company, discussed packing; William D. Winter, Atlantic Mutual Insurance Company, spoke on insurance, and Willis H. Booth, vice-president of the Guaranty Trust Company, New York, discussed agriculture.

Free from Michigan Taxes and in the Opinion of Counsel a Legal Investment for Michigan Savings Banks

$1,250,000

EDDY PAPER COMPANY

First Mortgage 7½% Ten-Year Sinking Fund Gold Bonds

Dated May 1, 1921 — Due May 1, 1931

Total authorized issue $1,250,000. Interest payable May and November 1, at the Continental & Commercial National Bank, Chicago, without deduction of 2% normal Federal Income Tax. Coupon bonds in denominations of $1,000, $500 and $100. Redeemable as a whole or in part at the option of the Company on or before May 1, 1926 at 105 and accrued interest and at ½% less each succeeding year thereafter until maturity. Registerable as to principal.

UNION TRUST COMPANY, DETROIT, MICHIGAN, TRUSTEE

The following information is summarized from the accompanying letter written by Mr. Oscar Gumbiner, Vice-President of the Company:

BUSINESS — The Eddy Paper Company was incorporated under the laws of the State of Michigan in 1906 with a capital of $18,500. Shortly thereafter they purchased the plant of the Three Rivers Paper Company, Three Rivers, Michigan, with an initial capacity of 2700 tons per year. This output has increased from time to time until at present the Company has a capacity of 100,000 tons of paper products per year. The Company now ranks as one of the very largest producers in its line in the world.

PLANTS — The Company's plants, with the exception of the small original plant, are of highest type steel and concrete construction. The equipment represents the latest and most modern development in paper machinery. The plants have a floor capacity of approximately 55 acres. Sprinkler systems are employed throughout and ample insurance is carried to protect the Company from all known hazards. All of the plants are located in Three Rivers and White Pigeon, Michigan.

SECURITY — These bonds are a first *closed* mortgage on all of the fixed properties of the Company now owned or hereafter acquired. Net tangible assets, after deducting all liabilities and using a sound depreciated value on all plants and machinery, as determined by independent appraisers, are *$4,800 for each $1,000 bond.* These bonds are followed by $1,750,000 par value preferred and $7,000,000 par value common stock.

EARNINGS AND PURPOSE — For the five years ended December 31, 1920, net earnings have averaged over three times maximum interest requirements and for the year 1920 approximately five times interest charges. The proceeds from the sales of these bonds will retire all bank loans and other loans, leaving the Company entirely free of debt with a large cash working balance.

SINKING FUND — The indenture will provide that the Company, beginning with the calendar year 1923, shall set aside 25% of its net earnings, after interest charges and Federal Taxes have been paid, as a sinking fund for the purchase of bonds of this issue at not exceeding the call price or for the redemption of bonds at the call price. Bonds either purchased or called for the sinking fund are to be cancelled. The minimum yearly sinking fund shall be $75,000.

MANAGEMENT — The same management which has built up the Eddy Paper Company from a small concern to one of the predominating factors in its particular industry is still in control of the Company and no change in management is anticipated.

THE NORTHERN COMPANY

12 YEAR FIRST COLLATERAL TRUST 8% GOLD BONDS

Dated March 15, 1921 Denominations $100, $500, $1000 Due March 15, 1933

DETROIT TRUST COMPANY, TRUSTEE

The Company was formed for the purpose of merging the American Life Insurance Company of Des Moines, Iowa, with the Northern Assurance Company of Detroit, Michigan.

The Northern Assurance Company, after giving effect to this merger, will have **insurance in force** estimated at $73,554,972 having a market value of over $1,000,000 and a **premium income** of $2,358,316 for 1921.

The Northern Assurance Company with the approval of the Michigan Insurance Commissioner has pledged 5% of its entire **premium income** which is nearly **five times the annual interest charges on this issue,** from which it is required to pay to the trustee in monthly installments sufficient amounts to meet the annual interest charges and sinking fund requirements for the retirement of these bonds.

All matters pertaining to this issue have been approved by Mr. William C. Manchester and Messrs. Stevenson, Carpenter, Butzel and Backus, Attorneys, Detroit.

Full particulars sent on request.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Wage Readjustments in Michigan

To What Extent Has Workers' Pay Been Reduced And What Has Been the Effect on the Output?

WHEN industry, under the necessities imposed by the Federal Reserve Board, began the process of deflation, it was said that labor would be "the last to deflate." Wages, which during the period of the war had become a production cost factor out of all proportion with their normal bulk, and had remained so for more than a year after the Armistice, would have to come down, but other costs would be tackled first. This decision on the part of employers was prompted by two reasons: First, it was apparent that the cost of living was not going to fall as rapidly as a good many people expected, and because of that employers wished to avoid imposing any unnecessary hardships upon the men and women who worked for them; and, second, it was expected that wage reductions would be met with opposition from employes all along the line—in fact the prediction was general that we soon would encounter a widespread series of strikes.

The process of deflation has been working out just as forecast. Inventories have been worked off or scaled down until now it may be said that business and industry have in this respect got back to a point somewhat closely approximating conditions previous to the war. Prices of materials have been and are still being battered down until now we are well on the road to normalcy in this regard. And ever since the first of the year, manufacturers have got around to labor.

Apparently Labor Expected It

Surprising as it has been to employers, they have experienced little difficulty indeed in reducing wages. There have been a few strikes, but they have been very much the exception to the rule. Labor has seemed to realize that it must do its share, both in the way of accepting less pay and in doing an honest day's work. Perhaps it has been forced into this way of thinking by the fact that so many thousands of men are out of jobs and are willing to take most anything offered. Perhaps, on the other hand, there have come home to it some of the extremeties to which employers have been forced, this last year. Its sense of loyalty may have been aroused by the realization that so many manufacturers have been keeping their plants open, at heavy losses to themselves, just to keep their organizations as nearly intact as possible. At any rate, labor, with exceptions, of course, has "fallen to with a will."

Wage readjustment in Michigan began about the first of this year. Factory executives held many conferences during November and December regarding employment conditions. It was seen that something would have to be done before long, and soon after January 1 superintendents and foremen began to sound out sentiment among employees. What they found astonished them. They found that most of the men in the shops were expecting that pay would be cut—indeed many said they were surprised that reductions had not been made before that time. In some instances, in fact, delegations of employes waited on the management, expressing their willingness to accept less money if only they could be kept on the job. In some cases employes even went so far as to submit new and lower scales.

So that the task of readjusting wages to meet the new conditions has not been so difficult after all. Dissatisfaction, it is true, was expressed in some factories, and there were scattered strikes, but, on the whole, the process was gone through without disturbance.

To what extent have wages been reduced in Michigan; how did employers go about the job; in what spirit was the readjustment received by employes; what has been the effect on the output per man, and what is the prospect as to additional cuts in the near future? This paper has within the last few weeks received several letters from readers asking these and other like questions. In order to answer them intelligently, a questionnaire embodying these points was addressed to a representative group of manufacturers within the state normally employing some 200,000 men and women. Replies have been received from factory executives whose working forces aggregate approximately 150,000 and who represent the following lines of manufacture: Metal working; automobiles, motor trucks and motor parts; paints, oils and varnishes; cement; office equipment; iron, steel and wire; stoves; furniture; food products; railroad equipment; machine tools; sugar; pumps and paper. In addition, the replies covered in a general way the building industry.

The following counties, in which are located most of the principal industrial centers in both the lower and upper peninsula, are represented in the replies: Wayne, Kent, Kalamazoo, Jackson, Saginaw, Bay, Genesee, Wexford, Washtenaw, Berrien, Barry, Lenawee, Calhoun, Ionia, Houghton and Iron.

The replies reveal that:

All but six of the employers reporting have reduced wages, and four of these have special conditions to deal with.

The reduction averages seventeen per cent, running in individual cases from five to thirty-five per cent. (In this connection note that the United States Department of Labor's statistics show that the cost of living has come down approximately this much.)

Eighty per cent of those replying made a straight cut in the hourly wage or piece work rate.

More than 90 per cent notified their employes either by posting notices in the factory one to three weeks in advance of the reduction or by having their foremen or superintendent talk personally with the workmen, either individually or in groups. Less than ten per cent adopted the method of closing down their plants for short vacations and then rehiring at the end of the period at a lower rate.

In less than a dozen cases was any resentment expressed by employes, and in these cases it was only general in character.

In almost every instance the output per man has increased since the wage reduction became effective, the increase running all the way from "slight" to 75 per cent.

Further Reductions Uncertain

Employers are uncertain as to whether they will be obliged to make further reductions in the near future, an even fifty per cent of the writers expressing the belief that wages had reached a minimum in their cases for the next few months at least, while twenty-five per cent said further adjustments were in prospect and with the other twenty-five per cent the wage policy would depend on business conditions.

The charge frequently is heard that manufacturers are taking advantage of the oversupply of labor to cut wages, their method consisting of "discharging men out of one gate and hiring them at another for less money." How far from the facts such allegations are is evidenced by the pains taken by employers covered by this questionnaire to explain carefully to their employes the reasons why they had found it necessary to reduce pay. In answer to the question: "What means did you adopt to notify employes?" the secretary and treasurer of one of the best known Detroit manufacturing concerns—a concern normally employing some 4,000 men and women—writes:

"By discussion with the division superintendents first; by a comprehensive exposition to the foremen of all the circumstances, events and reasons leading to the decision, and pointing out to them the importance of establishing, by a graduated wage scale, the incentive that is vital to progress; and finally to the employes through the superintendents and foremen, who explained the purpose of the move, verbally and in detail."

(This corporation classified all jobs in accordance with length of training, degree of skill and amount of endurance necessary to the proper performance of each, and adjusted its rates to correspond with this classification.)

A Bay City manufacturer writes: "In addition to the reduction in the base rate, some of the standards in our bonus or premium system were also changed, but still keeping well within the possibility for large increased pay either by individuals, groups or in the whole plant.

"In making the change in rates, we change the rate for the general classification throughout our whole plant, each man being individually rated under the general classification to which he belongs. The men are then notified individually, a statement being addressed to each one, indicating the reasons for the necessity of the change. In arriving at the changed individual rates, great care was taken by consultation with the foremen, as well as by comparison with our own experience record, and

Digitized by Google

all checked against the cost of living and the increased value of an employe because of long service.

"This action met with no resentment whatever and we believe it was thoroughly understood that no advantage whatever was being taken of the dull times and that the action was entirely reasonable.

"In addition to reducing wages, our working force has been much reduced, although we keep on our roll just as large a number as possible and allow them to alternate in time of work so as to bring some income to as a large a number as possible."

Given a Chance to Criticize

An Adrian employer says: "We posted up the wage scale in bulletin form where all the employes could see it some time before the reduction was made, giving them a chance to criticize the same before its taking effect."

The following is from a Battle Creek manufacturer: "We simply had the foreman in each department notify his men that the company found it necessary to reduce wages at that time and specified the amount of the reduction to each individual."

The instances just cited are typical of the means adopted by more than 90 per cent of the employers who answered the questions asked.

In this connection, excerpts from letters from four manufacturers who have not deemed it advisable or necessary to reduce the wage scale, are interesting. One writes:

"We have not as yet made any reductions, other than those brought about by their being employed only a portion of the time. We are at present able to give them work only half time and this naturally has reduced their earnings by that much. We do not anticipate any trouble or opposition if wage reductions become necessary. It is our endeavor to keep our employes fully apprised regarding the general conditions and our own financial situation, and it is our opinion they will believe a wage reduction necessary if we make the statement that such is the case. We shall probably be forced to this action a little later, for I feel that our men are suffering severely from the depression and do not wish to make the burden greater at this time if it can be avoided."

Another's experience: "When business shrunk away in the fall of 1920 we did reduce our working force and shortened our working day by one hour. This action was agreeably accepted by our men; the shorter day appeals to them, and leaving our wage rate where it was, we are getting an increase in output with a smaller force, and in this manner have reduced the amount of wages paid in proportion to production. We do not expect to make any reduction in the wage rate."

A Special Condition

A manufacturer who employs printers writes: "To-date we have made no reduction in our wages but are contemplating doing it within the next few months. In our particular line we do not feel that a reduction at this time would be wise, since I think you are familiar with the general printing conditions throughout the country. The quantity of our orders has been very much reduced, however—so much so as to compel us to cut down the working hours in three plants to forty-five hours a week from 54, and in two plants to thirty-six hours a week, from 54."

From a motor truck maker: "We have not reduced our wages for the reason that we have been employing during the last four or five months only our foremen and a few of our best employes, and for the reason that we have been operating on a four-day-a-week basis we do not feel that for the good of the organization we can afford to reduce wages. However, some reductions have been put into effect in this city and at any time that we add to our working forces in the way of common labor or semi-skilled labor we will put them on the basis of about ten or fifteen per cent reduction."

The lack of resentment at the reduction shown by workmen was surprising to employers, many of whom frankly confess they expected trouble. Following are a few quotations from letters:

From the general manager of one of the largest metal working concerns in Detroit: "We found no disposition on the part of our employes to resent our action. As a matter of fact, this cut has only recently been made, and most of them expected we would do it earlier when a great many other concerns were cutting pay."

From a Detroit corporation with plants in both geninuslas: "As nearly as we can figure, there was absolutely no feeling on the part of our employes; in fact, they were grateful to the company for continuing to operate under present conditions."

From a Detroit motor parts maker: "Each and every man, after reading the articles which we had posted, came into the office and requested that his wages be reduced twenty per cent, and we can truthfully say that we have not reduced a single man's wages in our plant, except those that personally requested it."

From an Adrian manufacturer: "There was really very little criticism, as the employes expected the reduction and probably, in the main, understood that it was necessary."

From the president of a Battle Creek concern: "There was no complaint, as the men all realized that if the company continued to operate by building stock for future sale, it would be necessary for them to accept a reasonable reduction in wages."

From a Belding manufacturer: "No particular comment has been made by the employes, they realizing that the wage scale now is much higher in proportion to the cost of living than it was a year ago."

Only Four Quit

From a Bay City manufacturer: "Early in January we discharged all men whom we do not pay by the month. We gave our monthly men one week's vacation and advised them that at the end of that period they could return to work, but that their pay would be reduced about thirty-five per cent. Three or four of our men did not return but the balance came back."

From the works manager of a Detroit metal working concern: "Labor conditions have taken a decided change; the supply for work without even asking the wages they are going to be paid. At that, we believe in being perfectly fair with our men, as most of them have been with us for a long time and have always been loyal through desperate labor conditions."

Hardly less surprising than the lack of resentment at wage reductions has been the increase in output per man since the cuts were made. The increase ranges all the way from "slight" to as much as 75 per cent. One manufacturer of automotive equipment writes:

"Every man that we are working today has appointed himself a committee of one to see that every man turns in a full day's work. Every man in the shop does his share of work. We are turning out approximately 2,000 parts per day. The reductions in the salaries of our employes have been able to reduce the price to the purchaser practically fifty per cent and do the work with eleven men less than we did the same work last year. In other words, we figure, and our charts show, that sixteen men are doing now what twenty-seven did last year on the same work, and are doing the job better, as our rejections have run practically nothing or less than one per cent, while during the months of April, May and June last year our rejections ran as high as twenty-per cent.

"Our manufacturing output during the month of April increased 100 per cent over March. The only way that manufacturers can live today is by the fullest co-operation of their employes; and there surely never was a time when the slacker was in greater contempt from the employes' standpoint. It can truthfully be said that if the manufacturers shall be permitted to gain their rightful place again, instead of the 'fighter will win' slogan, it must be changed to 'workers will win.'"

Some Figures

The following is from a letter from an upstate manufacturer:

"As to production, instead of reduction in output of pounds per man-hour, this has increased in a gratifying extent. To illustrate this, we would call your attention to a table attached herewith which shows the pounds of output of finished product per man-hour, which includes the entire shop and office payroll for the times indicated.

	Lbs. Output Per Man-Hour
Average January to October, 1920	7.58
November, 1920	8.42
December, 1920	9.21
January, 1921	7.60
February, 1921	9.78
March, 1921	11.87
Average November to March	9.20

"Note in this connection that from January to October, inclusive, 1920, we were running practically 100 per cent output. The reduction in personnel and in output began November 1, 1920, and has continued in an increasing ratio until at present we are running about forty per cent capacity. The figures speak for themselves and indicate the improved output during the latter period."

The Adrian district concern engaged in the manufacture of paint says: "There certainly has been a greater willingness on the part of some of the men from whom we could not speak well at all in the way of such service for the last year or two."

From an Adrian manufacturer: "There has been a marked increase in the output per man, resulting in from twenty-five to forty per cent more efficiency than a year ago and a general realization that this is necessary in order to hold their positions."

Among other expressions from employers as to individual efficiency per man, since wage reductions were made, these may be found: "Thirty-nine to 70 per cent increase;" "Getting better than one-third more production per month than we ever got before;" "Increase;" "Slight increase noticeable in the output of the day workmen, and hourly final results are constantly time studied;" "Increased considerably over last year;" "Owing to our greatly reduced volume we have been unable to show much of an increased output per man;" "More than doubled increase in output per man;" "Marked increase over a year ago;" "Men are doing their work more cheerfully;" "Twenty per cent increase;" "Increased efficiency has made it practicable for us to operate with less number of people;" "Our percentage of work performed per man per day has increased about 75 per cent;" "Increased slightly."

Only one manufacturer of the entire number answering the questionnaire has noted a falling off in output per man. He writes: "The number of employes on our roll in February, 1920, was 537, and the number on our payrolls in February, 1921, was 556. Considering our production during February, 1920, as 100 per cent, our production per cent for February, 1921, is 12½ per cent decrease conservatively estimated." He does not give the reason for falling off.

A Rap at Retailers

As was said in an earlier paragraph, employers are evenly divided on the question as to whether further wage cuts will be necessary within the next few months, half of those writing believing the minimum has been reached at least for the present, while half the remainder say No and the other half say their future policy will depend entirely on business

Saving America's Dye Industry

Why German Competition Must Be Stopped, and How; Two Meetings of Industrial Leaders Held in Detroit

By F. W. HERSEY

PRIOR to the war the most important industry in the world was the manufacture of dyestuffs, although the world did not know it. Such a statement will arouse immediate challenge in view of the mighty power of the steel industry, the ramifications of the rubber industry, the importance of the transportation industry, the great strides made by the automotive industry and the dependence of human life upon the food industry. They were all considered greater before the war than the business of making colors, so far as public opinion was concerned, but public opinion was not interested in making war.

The American public knew of the dye industry as one exclusively German. Germany furnished 90 per cent of the dyes used throughout the world, and yet in a single year the valuation of the dyes manufactured by her was only $68,000,000. The significance of this statement can be understood only when one thoroughly understands the real use Germany was making of that industry. From the production offices of the great textile mills in this country to the bargain counters of department stores one question and one answer typifies the trend of American opinion. The question was: Are these fast colors? If they are, they must be German.

The American Industry Is Born

When war shut off trade with Germany housewives began to complain of colors "crocking" and "running." The textile manufacturers voiced the same complaint. When the German submarine freighter, Deutchland, stole into New London, Conn., after evading the English blockade and carrying under water a boat load of "priceless" dyes there was great rejoicing among the textile manufacturers and users of dyestuffs, and a wild scramble for the limited supply at any prices demanded.

As the war progressed there were fewer complaints against the colors on the market, a greater supply of good selected colors and less connection between the dye industry and German dye manufacturers. The reason lay in the rapid development of an American dye industry in which millions of dollars were being invested and the best chemists engaged. Of course the main object was not the manufacture of dyes for commercial purposes but the production of chemicals for war purposes. This country had become so accustomed to relying practically on one source for the many derivatives of coal tar that little thought had been given to developing this industry in the United States. The war forced the issue. But even the stress of war and the call for the manufacture of essentials only did not prevent the manufacture and marketing of some dyes.

While the first product did not successfully match the German product, continued experimentation and the gradual development of facilities resulted in great improvement in the staple dyes and an increase in the quantity. This was the beginning of a real dye industry in the United States. As the intermediates from which colors are produced by various chemical reactions are obtained from coal tar, a by-product of bituminus coal in the manufacture of coke, the supply of raw material was then, and is now, greater in this country than in all of Europe, and as great as in any other country on earth. The problem confronting this country in the manufacture of dyes is not one of raw materials, but of knowledge of organic chemistry, adequate production facilities and such protection as will safeguard the investment necessary to finance plants and the training of the dye chemists of the future.

In 1914 there were seven establishments in the United States, $3,000,000 invested and 500 persons employed in the manufacture of dyes at $3,536,795. Four years later there were 77 companies making finish dyes to the amount of 58,464,866 pounds valued at $62,026,390, which was 45,977,246 pounds increase over 1917. Dyes made in 1918 were not produced in 1917 because they had not been developed. This indicates how rapidly the dye business was developing. The producers of intermediates, of which the four important ones are benzol, naphthalene, toluol and anthracene, numbered 127; their annual production was 357,662,251 pounds valued at $25,382,892. In synthetic drug manufacture there were thirty-two drugs of coal tar origin being made by thirty-one United States firms having a total output of 3,500,000 pounds valued at $8,000,000. Three of these drugs were used in stemming the influenza epidemic.

The coke industry in 1918 produced 25,900,000 net tons of by-product coke and 3,480,000 net tons of beehive coke. The total output of finished products of coal tar origin, exclusive of poison gases and explosives, was 75,494,000 pounds, valued at $83,095,404. In the research work necessary, 2,000 chemists and technically trained men and 25,000 untrained men were employed at wages of from $10 to $75 a week, and only 15.4 per cent received less than $25 a week. There are now 157 different dye plants employing 77,000 persons who produced 29,000 tons of dyestuffs and 9,000 tons of photographic chemicals, perfumes, flavors and intermediates for dyes and military purposes.

At the present time there are 11,037 establishments in the United States, employing 1,070,460 persons, absolutely dependent upon dyestuffs, and 56,949 establishments employing 1,037,183 persons, indirectly dependent upon dyestuffs. At one time 400,000 persons were thrown out of employment because of the lack of dyestuffs.

Colossal Struggle at Hand

This brief survey of the dye industry has been given to explain the possibility of this industry if German competition is removed and sufficient encouragement given to its promotion. The United States today stands on the brink of what most probably will be a struggle for industrial supremacy unlike anything ever witnessed before. Germany will not relinquish her control of the American dye market without having exhausted every means within her power to hold it. She has $500,000,000 invested in the dye industry. German dye plants, in some of which more than 11,000 distinct dyes are made, have been united in one enormous trust known as the "I. G. Trust," the purpose of which is to finance and conduct a campaign to recover all the dye markets of the world temporarily lost as a result of the war.

One reason why Germany was so confident of victory in the war was the knowledge, first, that the struggle would be mainly one of chemical weapons, and secondly, that she had the finest and greatest chemical producing

plants and organization in the world. Also, that by creating a monopoly of the dye industry she had prevented her enemies from developing chemical plants and learning the secrets of chemical warfare. She failed to win the war but she still has her dye industry, intact and prepared to produce all the dyestuffs the world can use for years to come.

In any consideration of the dye industry the subject must be handled in three main divisions—dyes and industrial chemicals, synthetic drugs and war munitions. Subdivided from another angle the dye industry means industrial preparedness, health preparedness and war preparedness. The subject is far too extended to be handled in one article; therefore we shall consider first the subject of dyes from the standpoint of industrial progress and preparedness with the need of protection by adequate legislation.

Two Meetings in Detroit

Until there has been the necessary protection of the dye industry in this country there can be no effective competition against our late enemy. It is the accomplishment of this protection that is engaging the attention of the Chemical Foundation, Inc., chemical and dye manufacturers and legislators. It is recognized that the subject of trade competition with Germany is an all-American subject, that any industry which embodies the key to adequate national defense concerns the whole United States rather than any one industry which may benefit by such legislation as may be enacted. For this reason those statesmen and industrial leaders who wish to see the United States independent of Germany or any other nation in its industrial development are endeavoring to arouse public opinion in support of measures protecting our infant dye industry.

Michigan is as much concerned, both as a manufacturing state and a consuming center, as any other state in the Union. The support of Michigan is desired, and to this end two important meetings have been held in Detroit for a thorough discussion of the dye industry and its rights to protection. The first meeting was held last week at the Detroit Athletic Club, where representative manufacturers gathered to pledge their support to any reasonable legislation that might be required.

The second meeting was held in the Detroit Board of Commerce May 17, and addressed by Joseph H. Choate, Jr., counsel for the Chemical Foundation, Inc., who announced that Congressman Nicholas Longworth was preparing to introduce a bill prohibiting the importation of coal tar products into this country for three years except under licenses to be granted by the United States Tariff Commission. These licenses would be granted only to importers when certain dyes could not be obtained in this country, or if obtainable could not be purchased at reasonable prices or within a reasonable length of time.

The Longworth Bill

On August 1, 1919, Mr. Longworth introduced in the Sixty-Sixth Congress a bill providing for an increase in tariffs on dyestuffs and an embargo against German dyes. In effect this bill amended the existing tariffs law in full particulars, as follows:

First, it brought the phraseology of the existing law up to date to prevent the evasion of its provisions through undervaluation and false designation of articles imported.

Second, it repealed the provision under which specific duties were to be reduced at the rate of 20 per cent a year for five years.

Third, it increased the rates of duty from 15 per cent ad valorem and 2½ cents a pound on intermediates, to 40 per cent ad valorem and six cents a pound on intermediates; on finished products, from 30 per cent ad valorem and five cents a pound, to 45 per cent ad valorem and seven cents a pound, which made the duty on intermediates substantially the same as on the finished products.

Fourth, it provided that no foreign dyes could be imported into the United States for two years except under licenses granted by a license board to be created under the act.

This measure designated coal tar products and differentiated between dyes and certain chemicals as the finished product and the intermediates from which they were derived, but the term "coal tar products" was used so that under that law it would have been impossible for Germay to export any of her coal tar products except by smuggling.

This bill went to the Senate, where the license provision was stricken out and in its place a provision for an embargo for three years was made to be administered by the Tariff Commission. This was done because the Senate objected to the licensing method as against American policy. The measure went into committee in both the House and Senate and was reported out favorably. Marked opposition to the measure was shown by Senator Thomas, Colorado, and Senator Moses, New Hampshire.

Senator Thomas spoke for seven days and a half against the measure. This filibuster killed the bill. There was behind this opposition two main influences. One was pro-German opposition to the measure because it meant the total destruction of Germany's hopes in the American dye market. The other was the fear of a few textile manufacturers, importers of dyes and users in other lines of manufacture, that the measure would result in a marked increase in the cost of dyes and the impossibility of getting certain selected dyes not being manufactured in this country.

The second bill which Mr. Longworth will sponsor will resemble the first one in all essential details, except that the license feature may be replaced by a three-year embargo. There is now a movement afoot to have the embargo term increased to ten years.

As said before, the dye industry has three main divisions, each of which would be sufficient unto itself as an argument against permitting German competition. For forty Germany has been making coal tar products. Germany is a country in which, prior to the war, scientists, chemists and industrial workers ranked second only to the military leaders. Every encouragement was given to the training of chemists by the government. They might be called the third arm of defense. In peace the dye industry gave Germany the leadership in the world in certain essentials to the well being of other industries. She allowed no competition to develop in any country. She used the same tactics in promoting her world market for dyes as she used in prosecuting the war.

She gained eminence through the quality of her product, and, having established the market, she resorted to every method, unscrupulous or otherwise, to hold it. Her agents operated in every country. In the United States as elsewhere, her spies were planted to bribe officials, block legislation, undersell and corrupt. The spending of huge sums of money, either for blocking legislation, corrupting officials or in selling her product below cost was carried on without concern so long as she retained control of the market.

Germany's Real Object

We know now what her real object was. The commercial side of her activities were secondary. The main purpose was to keep supremacy in the knowledge of organic chemistry, in the production of coal tar products and plant facilities within the borders of the German empire, and to prevent the nations which were her enemies from later from having the production power and the chemical secrets when war came to decide the fate of nations. To that end Germany planted her agents in the mills where German dyes or chemicals were not used, and these agents, by mixing substances or changing processes, lowered the quality or entirely spoiled the products to force the use of German goods.

Between Germany's competitive methods and the willingness of American industry to rely upon foreign nations for certain materials believed to be unprofitable for concerns in this country to manufacture, Germany succeeded in dominating the American market and the industries dependent upon dyes and other coal tar products. This is important when it is realized that the industries dependent upon dyestuffs produce goods valued at $3,000,000,000 annually, and that, prior to the war, American plants and assembly plants for German intermediates supplied only one-tenth of the American market.

In one of his war-time letters, Count Bernstorff reported to his government that the stock of dyes in the United States was so small that by withholding her exportations, Germany could throw 4,000,000 men out of employment. In 1915 Germany tried this plan to force hostile action against Great Britain and at least partial lifting of the blockade. Had Germany been able to flood this country with her textiles, that industry would have received a blow from which it might never have recovered. The dye shortage became so serious that at one time it was feared that the Government Printing Office would have to close, and the prices of some dyes went up 5,000 per cent. In 1913 the United States was importing 45,000,000 pounds of dyes and the value of the amount consumed was $25,000,000. Germany sent to this country 900 different dyes.

Rather than bend the knee to Germany, the American patriots went to work to develop a dye industry and at the same time get the by-products necessary to make poison gas and

(Continued on Page 33)

ANY DOUBT regarding Germany's "all-seeing eye" and her methods of stifling competition, which may linger in the minds of readers, should be dispelled by the experiences of the Dow Chemical Company, Midland, in attempting to compete with Germany in the manufacture and sale of chemicals. The Dow company began the production and marketing of bromides and was so successful that the attention of the German chemical trust was focused upon Michigan. An agent of the trust came all the way to Midland to interview Mr. Dow. The agent minced no words but informed Mr. Dow that he must cease the manufacture of bromides. It easily can be imagined the kind of reception the German representative received. Before leaving none to gracefully be informed Mr. Dow that his concern would dump upon the American market two pounds of bromides for less than it would cost Mr. Dow to make one pound, and the threat was carried out so effectively that the Dow Chemical Works went out of the bromide business in the United States.

But Mr. Dow turned a Yankee trick on the Teutons by manufacturing in Germany and selling on the German market bromides at prices lower than the Germans could manufacture them.

Grinding As a Production Process

Why Is It Actually Necessary in the Modern Factory? Advantages of Various Methods in Common Practice

By ALBERT A. DOWD
and
FRANK W. CURTIS

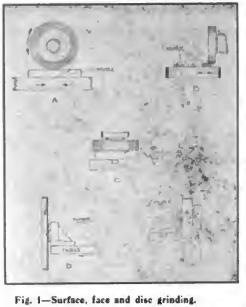

Fig. 1—Surface, face and disc grinding.

HOW can the process of grinding be used to assist production? Why is it not only advisable but actually necessary in the modern factory?

The manufacturer who is in competition with others, whether in the same or in different lines, will give careful consideration to the advantages of grinding operations in connection with his particular kind of work. If he does not do so he is "behind the times" and his work will not compare favorably either in quality or accuracy with that of his more progressive neighbor. In addition to this there are a number of cases when a grinding operation will rednce the cost of production very materially.

In considering the process of grinding and its application to the finishing of work, let us mention a few cases in order to make its advantages more clearly apparent. In finishing a surface on a casting or a forging, the work can frequently be held by means of a magnetic chuck and the surface ground without difficulty, thus doing away with expensive holding fixtures which might otherwise be necessary. Also, when work has been hardened it is likely to be distorted more or less so that it is absolutely necessary to finish it by grinding in order to be sure of the accuracy.

Grinding can be used instead of a turning operation in some cases but judgment must be used in determining when it will be profitable. In turning tubing to size, for example, the process is usually very slow and expensive, yet a grinding operation may be used instead of the turning method, with quite astonishing savings in the cost of production. The work produced will also have a better appearance and it will be much more accurate.

Not very long ago a case of this kind was encountered in a factory investigation. The tubing was being turned and finished to size on an engine lathe and the process was very slow and more or less unsatisfactory. The installation of a plain cylindrical grinding machine effected a reduction in the cost of production of nearly 75 per cent and also gave a more satisfactory piece of work. In many other cases the grinding process can be used to bring about substantial savings in the cost of manufacture.

Various Grinding Processes

In the application of grinding for the removal of stock and to produce accurate results there are a number of types of machines, each of which is suited to a particular variety of work. There are surface grinders of several kinds, with grinding wheel spindles arranged both vertically and horizontally; there are disc grinders of several kinds; cylindrical and universal machines, internal and chucking grinders and others of types more or less specialized.

In order to select the proper machine for a certain kind of work it is necessary to understand something about the fundamental principles involved in the grinding process. A very good general idea can be obtained, however, without going into the technicalities of wheel speeds and feeds, qualities of abrasives and other matters of importance from an engineer's standpoint. A few diagrams can be used to illustrate the principles employed on various kinds of work and to make clear the points of importance in connection with the subject of grinding in general. The descriptions will be given in non-technical language so that they can be readily understood by any executive, whether he is a technical man or not.

Fig. 1 illustrates several forms of surface and face grinding in a diagrammatic way. The illustration at "A" is a simple job of surface grinding which is done on a machine having a reciprocating table which carries the work as indicated. The grinding wheel removes the stock a little at a time as the work passes back and forth under it. In the example "B" the work is set up on a revolving table as indicated, and is held usually by means of a magnetic chuck. As the table revolves, the various pieces pass successively under the grinding wheel, so that the stock is removed

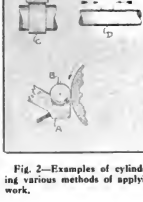

Fig. 2—Examples of cylindrical grinding, showing various methods of applying the wheel to the work.

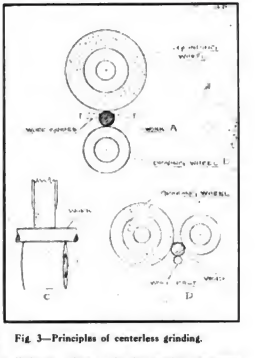

Fig. 3—Principles of centerless grinding.

a little at a time, as in the previous instance.

In the example "C" the work is placed on a reciprocating table as indicated, but the grinding wheel is of the cup variety and the work passed under it in such a way that the stock is gradually removed. The method shown at "E" is also a surface grinding proposition, but the work in this case is set up on edge so that the wheel attacks it horizontally. When this method of grinding is used the table is reciprocated and stock is removed gradually as in the other instances mentioned.

The method shown at "D" is termed disc grinding. The work in this case is set up on a swinging table and is passed back and forth over the face of the wheel on which an abrasive disc is mounted.

Fig. 2 shows a number of examples which illustrate the application of the grinding wheel to the work when the latter is of a cylindrical character. One of the important points in connection with grinding of this sort is the support of the work. The diagram at "A" shows a piece of work "B" which is supported by means of an adjustable rest in such a way that the action of the grinding wheel tends to hold it firmly in place so that there is no "chatter." As the matter of support in grinding is of the greatest importance, particular attention should be paid to it in any grinding operation. There are several ways in which cylindrical grinding can be accomplished, viz.: the table carrying the work can be traversed along the wheel while the work is revolving, as shown at "D;" the wheel can be dressed true and hrought up directly in contact with the work when a short piece or portion of a piece is to be ground cylindrically. This method of grinding is clearly shown at "G."

When it is necessary to grind a surface smaller in diameter than the remainder of the work and when this surface lies between two shoulders, it is necessary to dress the wheel as shown in the example "E." Then the work can be traversed slightly in order to

Digitized by Google

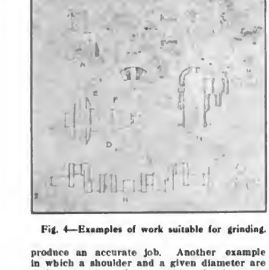

Fig. 4—Examples of work suitable for grinding.

produce an accurate job. Another example in which a shoulder and a given diameter are to be ground at the same time is shown at "F." in this instance also the wheel must be dressed true both on the side and on the diameter in order to produce the work accurately. The examples of cylindrical grinding illustrated in Fig. 2 are all held on centers but there is another method of grinding work cylindrically in which centers are not used.

Centerless Grinding

For various kinds of medium sized cylindrical work, such as pins, stud and small shafts, another type of grinding machine is often used. This type is termed a centerless grinder. The principles of this method are clearly illustrated in Fig. 3. The work, "A," lies on an abrasive driving wheel, "B," and is held in place between the work guides indicated. The work is driven by the driving wheel in the same direction as the rotation of the grinding wheel; therefore, as it is rotated, the stock is rapidly removed by the abrasive action of the wheel. The work is fed by the driving wheel, which is set at a slight angle to the grinding wheel so that its rotation causes the work to pass smoothly along under the surface of the wheel. This is clearly indicated at "C" in the same illustration. The angle of the driving wheel can be changed to produce various feeds.

The application of a somewhat similar principle is shown at "D" in the same illustration. In this case, however, the location of the work rests and driving wheels are slightly different.

The manufacturer frequently is confronted with a problem in manufacture, regarding which he is doubtful as to whether it is more economical to finish the various surfaces by milling, boring, turning or grinding. A decision on these matters is of vital importance in his production program and a careful analysis should therefore be made in order to select a machine suitable for the work in question. A number of examples of work suitable for grinding are shown in Fig. 4. Some of these pieces are of steel while others are of cast iron. The selection of the proper wheel for a given kind of material is also of great importance, but wheel makers give sufficient data in their catalogues to enable an operator to select a suitable wheel for any piece of work.

In order to form a better idea of the application of the grinding process to manufacture, let us examine the various examples shown in Fig. 4. In the example "A" the work is a shaft which has been previously turned, after which it is hardened and ground. In the grinding operation it is necessary to form a curved surface and therefore the wheel used must be dressed to the proper shape. Cylindrical grinders can be provided with wheel truing devices of such a nature that they can be applied to shape the wheel to the required form. The bushing shown at "B" is to be ground both externally and internally. The external work can be readily accomplished on a cylindrical grinding machine, while the inside diameter must be ground on an internal grinding machine or by means of an internal attachment.

The example shown at "C" is a bevel pinion in which the hole must be ground in such a relation to the teeth that it will run true. This kind of work requires a special method of setting up in order to obtain the correct relation of the hole to the teeth of the gear. The work shown at "D" has several grinding operations on it. The cylindrical work can be easily done on a cylindrical grinder but the angular faces shown by the dotted lines at "E" and "F" require a universal machine in order to generate the taper properly.

The gas engine cylinder shown at "G" is to be ground externally and this kind of work is generally done on a special type of grinding machine designed for the purpose. The six-throw crankshaft shown at "H" in the same

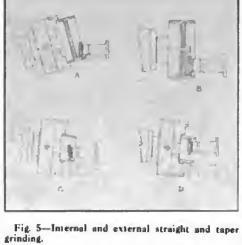

Fig. 5—Internal and external straight and taper grinding.

illustration must be ground in a number of places. The cylindrical grinder is used for work of this kind and a special indexing fixture is placed on the head of the machine so that the various bearings can be brought into their correct position for the grinding operations. The diagrammatic end view shows the relative positions of the various bearings which are to be ground.

The accuracy and reliability of the grinding process adapts it particularly to work requiring close fits and as a consequence it is now applied to many cases in manufacturing which a few years ago would have been turned or bored. For parts having conical or tapered surfaces, as well as those which have a radius, the grinding process is particularly well adapted. Fig. 5 shows several examples of internal and external straight and tapered grindings. The example "A" shows a tapered internal surface which is ground on a universal grinding machine by holding the work in a chuck as indicated. As it is necessary to make the opposite internal surface concentric, it is apparent that the second setting of the work must locate from the previously grounded taper, as indicated at "B." When this is done by means of a simple fixture, the other surface can be ground readily on a plain grinding machine.

In the example shown at "C" in the same illustration a tapered bushing is to be ground externally and internally in the same setting. The method of holding in this case is by means of a chuck having special jaws cut away so as to permit the grinding wheel to complete the inner surface without interference. The outer surface is ground with the same grinding spindle and an extra setting of the work is not required.

Another example of a similar piece of work is shown at "D," but as the method of procedure in this case is similar to the other, no particular comment is necessary. In the operations "C" and "D" a universal grinding machine is used.

Application to a Shaft

Fig. 6 shows a number of applications of the grinding process in manufacturing a splined shaft. This is a transmission shaft for an automobile. A number of grinding operations are necessary on it after it has been hardened. This is a very good example of the application of grinding to a piece of work which would otherwise be practically impossible to manufacture within the required accuracy. In following through the various operations it will be noted that the example "A" is a plain cylindrical grinding proposition. As great accuracy is required on this part, the work is set up twice and the 0.751 diameter ground first, after which another setting is made in the same manner, as shown at "B," at which time the 0.749 diameter is finished. Greater accuracy is produced when very close dimensions are required by making two operations, one of which is roughing and the other is for finishing. Two other cylindrical grinding operations are shown at "C" and D." These also have roughing and finishing operations on the same portion of the work.

It will be noted that a small diagram is shown at "E" in order to illustrate the method of grinding the splines on the shaft. This operation is done with a formed wheel, which is carefully dressed in order to preserve its accuracy. The work is indexed for the various operations and the machine used for the purpose is of a special nature designed for this purpose. The outside of the shaft is ground as shown at "F." This also is a cylindrical grinding operation. After this work has been done a knife edge wheel is used to cut off the end of the work, as shown at "G," thus removing the center and the end which was required in order to dog the work during some of the other operations. The finishing operation on the work is the grinding of the square portion by means of two cup wheels shown at "H." After two sides of the shaft have been ground, the work is indexed 90 degrees and the other two sides are completed.

When ball races with angular or spherical

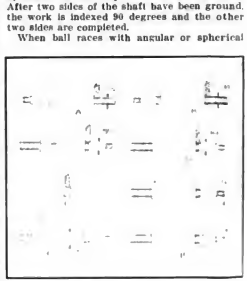

Fig. 6—Various applications of the grinding process in manufacturing a splined shaft.

Digitized by Google

seals are to be ground a special type of machine is used. A general view which illustrates the principles of this machine is shown in Fig. 7. A reference to this illustration will show the general points in its construction. The work, "A," is held in a collet chuck or similar device, and the spindle on which it is mounted is arranged in such a way that it can be adjusted in or out toward the center, "B," and it can also be swung radially about the center.

The wheel spindle, "C," is mounted on a slide which can be traversed by means of the handle, "D." In grinding an angular surface such as that shown on the work, "A," the head of the machine is locked in the correct position and the grinding spindle head is traversed back and forth to finish the surface.

Several other examples suited to this type of machine are shown in the same illustration. The diagram at "E" shows the application to a piece of annular work which is held in much the same manner as that previously described. The traversing of the grinding wheel spindle is also done in the same manner. The work, "F," is a collar having a radial groove, which is also to be ground for a ball-bearing and in this case the work is swung around back and forth while the grinding wheel is in contact with it in such a way that the curve is generated by the grinding wheel.

Fig. 7—Angular and cup grinding.

The example shown at "G" is an internal bearing race, which is ground by means of a formed wheel, as indicated. The work shown at "H" is a thrust bearing collar having a radial groove. This work is mounted in a chuck on the work holding spindle, and the radius is generated by swinging the work spindle through the arc required.

Other applications of angular and cup grinding methods could be shown, but those illustrated are representative of the various kinds in common use. If a manufacturer has much of this kind of work it is advisable to select a machine for the purpose which will have sufficient latitude to handle the various sizes which he is called upon to make.

It has been the attempt of the writers in this article to treat the subject of grinding from the standpoint of the man who does not know how to apply the process in his own shop, in order to show him the advantages of the various methods in every day practice. There are many special applications of grinding to different lines of manufacture and accuracy of the work produced is such that it commends itself to the discriminating judgment of all manufacturers of high-class products.

Grinding Machine Is the Invention of John R. Brown

ALTHOUGH the grinding machine as it is known today has been one of the most important mechanical factors in the development of accuracy, finish and economy in production, little attention has been given to the history of this machine.

In 1910 the publication "Machinery" carried an article concerning the invention of the grinding machine by John R. Brown, who was then senior partner in the firm of John R. Brown & Sharpe, Providence, R. I. Like the milling machine, the power grinder was a shop development intended merely as an aid to producing better work in the shop of Brown & Sharpe plant. It was only after the value of this machine became established in the mind of Mr. Brown that he decided to make it for general sales. In that plant the first machine was used to grind needle bars, foot bars and shafts for the Wilcox & Gibbs sewing machine. The device consisted of an emery wheel mounted on a carriage of a lathe and moved backward and forward in contact with the work.

In 1844 the first drawings for a grinding machine were made in the Brown & Sharpe plant. For the first machines parts of a 14-inch Putnam lathe were used. A wheel stand was mounted and to it added a feeding mechanism which included a reverse. Since then the footstock and feeding mechanism have been removed and the old machine is now used for grinding the faces of dies. As early as 1862 cylindrical grinding was done in the plant with a form of back-rest containing the essential features of the type of back-rest used today. A spring back-rest was used also for finishing and was applied by having a spring rod extending from the footstock. This rod carried leather washers which pressed against the work, and considerable skill was required in the adjustment of this back-rest to prevent chattering. Regarding this machine "Machinery" said:

"A dead center pulley, an important step in the development, was used. Wet grinding was done on these early machines by using a wet sponge held by hand against the work. The sparks were quenched in a dish of water placed below the work. Later a supply of water was provided through a nozzle.

"During the next few years about thirty of these machines were built and sold, the same plan of using dismantled Putnam lathes being followed. The first machine was sold to the Leavitt Sewing Machine Company, Boston, in 1865. The second one was sold to Charles Callefant, Paris, France. It included an apparatus for grinding bevel cutters. Several of these machines were in constant use in the Brown & Sharpe plant on sewing machine parts, but work kept piling up ahead of them and could not be hurried, as a considerable amount of time and a high degree of skill were required to produce work of a sufficiently high standard. There were also many kinds of work where finishing by grinding would be an advantage but which could not be done on these machines."

During this period Mr. Brown had constantly in mind the need of building a machine designed from the floor up, especially for grinding, with the result that in 1868 he had a drawing made of such a machine, which embodied most of the essential elements of the present grinding machine. This machine had the same wheel stand as the early carrier grinding lathe, but instead of having the wheel travel there was a sliding table which carried a swivel table on which were mounted the headstock and footstock, the headstock being arranged to swivel. This machine did not have a swivel wheel stand. No machines were built at this time because of the pressure of other business, but in 1874 working drawings were made for a machine which included a swiveling wheel stand and other features of improved construction. There were stops on the cross feed hand wheel, a feature which previously had been used on the earlier grinding lathe.

"One interesting feature of this machine was an arrangement for carrying off the water used in grinding. Another was the wheel spindle, the bearings and boxes of which were of hardened steel and had double tapers, the nature of which would indicate that there must have been some difficulty in producing them without a universal grinding machine. One of these new machines was sold to E. Corneley, Paris, France, in 1875 or 1876. The first machine of this type was exhibited at the Centennial Exposition in 1876, and at the close of the exposition was sold to M. Heilmann-Ducommun and Steinlen, Mulhouse, Alsace. The first machine sold in America was to the Whitehill Manufacturing Company, New York city.

"The judges at the Centennial Exposition, commenting on the Brown & Sharpe exhibit, said that these machines were characterized by great neatness of design and excellence of execution." Special mention, with commendation, was made by Thomas Bentley in his history of the exposition, published in 1876. He said:

"The superior class of tools here represented are of a character fitted to elevate the standard of workmanship in connection with machine shop manipulation. Accurate tools like these produce accurate and interchangeable work, cheapening production and at the same time giving that perfection which is becoming more and more indispensable in the sharp competition attending the manufacture of machinery. The machines themselves illustrate not in the least degree workmanship and finish, and in the nice adaptability of their motion and parts to produce the required work."

When Mr. Brown died in 1876 application for patent on the universal grinder was made, and it was issued February 27, 1877. The drawings submitted at that time were for a machine for form grinding as well as ordinary uses. A smaller machine was designed a few years later, which is known now as the "Baby Grinder." Since that early day the improvement of grinding machines has been steady, but the essential principles are today the same as were applied by Mr. Brown.

U. OF D. ENTERTAINS ENGINEERS

Members of the Detroit Chapter, American Association of Engineers, were guests of the University of Detroit Club of A. A. E. this week. The feature of the visit was an inspection of the engineering laboratories of the University. The chapter has arranged for its members a series of inspection trips to various industrial establishments and public utilities. The first of these have been made, the engineers visiting on the first trip the Connors Creek plant of the Detroit Edison Company, and on the second the concrete silo system of coal storage of the Mack avenue branch of the Malcomson Coal Company.

TOWER JOINS WEST CHEMICAL

R. Tower, formerly superintendent with the Oliver-Johnson Company, Inc., Providence, R. I., resigned his position May 1 to become a member of the West Chemical & Paint Company, Springport, Mich., manufacturer of paints and specializing particularly in industrial paints.

Hupp Cuts Prices; More Tire Makers in Line

ANOTHER automobile manufacturer has joined the list of price cutters. The Hupp Motor Car Corporation, Detroit, announced last Sunday a reduction of $200 on its open models and $315 and $325 on its two closed cars, the lower schedule going into effect immediately. The following are the new and the old prices of the Hupmobile:

	New Price	Old Price
Two-passenger roadster	$1,485	$1,685
Five-passenger touring	1,485	1,685
Four-passenger coupe	2,400	2,725
Five-passenger sedan	2,485	2,800

The Columbia Motors Company, Detroit, will not reduce its prices until August 1, at least, contrary to a report which was circulated during the week and which prompted the company to send the following announcement to its sales staff:

"The recent reduction of the list price of various automobile companies has no doubt brought inquiries from your trade regarding policy of our company. Our reduction in prices last fall was made in anticipation of lower costs on material and labor. Consequently we feel justified in guaranteeing our present prices until August 1, 1921."

Vice-President A. G. Seiberling, of the Haynes Automobile Company, Kokomo, Ind., makes the statement that present prices of Haynes cars will not be reduced at the expiration of price guarantee, July 1.

"The margin of profit is figured so closely that the Haynes company cannot possibly undertake a price reduction without sacrificing quality, and, of course, we will not lessen the at value of the car in any respect," says Mr. Seiberling.

The Hudson Motor Car Company and the Essex Motors Company, Detroit, in answer to reports that prices of Hudson and Essex cars were to be reduced, has wired to all its dealers and distributors as follows:

"Statements indicating that we are about to reduce prices on Hudson and Essex cars are without foundation.

"When we reduced both cars last fall from $500 to $450, we anticipated market changes that have since become effective. You can use this message with your trade."

The statement is made by President A. R. Erskine, of the Studebaker Corporation, that no price reductions are contemplated by the corporation at present.

Prices of the Dort cars have been reduced from $100 to $150, the Dort Motor Car Company announcing the following new schedule:

	New Price	Old Price
Five-passenger touring	$1,115	$1,215
Roadster	1,115	1,215
Coupe	1,585	1,685
Sedan	1,835	1,995

In connection with the reduction, General Sales Manager John D. Mansfield said: "These reductions are on the new model Dort cars first introduced in January of this year. As the new Dort is not a pre-war car, we, of course, are not endeavoring to establish pre-war prices, for there is not a pre-war price standard from which to judge these new models.

"Dort prices have been lowered because we have reached a production basis that enables us to operate on a lower overhead per car built."

The Paige-Detroit Motor Car Company, to put an end to rumors that a price reduction is impending, made the following announcement this week:

"Last fall—September 28, to be exact—we announced a reduction in price on all Paige models. These reductions were not warranted at the time, as we frankly stated in our announcement. They were made in anticipation of a drop in the costs of production which we believed to be inevitable.

"That drop actually materialized this spring, but having already anticipated by our recent price cuts, there can be no further reduction in the price of current Paige models and there will be none. In view of the facts stated, any further reduction would not be unwarranted, but could not be made without sacrifice of quality."

Thus, while motor car manufacturers are not failing into line as rapidly as had been expected in some quarters—which, however, does not mean that they will not gradually do so—hardly a day passes without an announcement of a price cut by a tire maker.

The Firestone Tire & Rubber Company has announced a reduction of 15 per cent on its cord tires, 17 per cent on its fabric tires and 20 per cent on tubes. Furthermore, and also as a competitive measure, it was stated that a new 30 by 3½-inch smooth-tread Firestone tire would be placed on the market, the selling price to be $13.95.

The Fisk Rubber Company has announced reductions ranging from 12½ to 20 per cent on its tires and tubes.

The Miller Rubber Company reduced the price of cord tires an average of 12½ per cent; fabric tires 17½ per cent and tubes 20 per cent.

The Kelly-Springfield Tire Company reduced prices on its pneumatic tires, except Ford sizes, 20 per cent; Ford-size, 22 per cent, and tubes 30 per cent.

The United States Rubber Company has made the following reductions: Royal Cord tires, 11½ per cent; Usco treads, 15 per cent; Chain and Nobby treads, 17½ per cent; tubes, 20 per cent.

It is the opinion of some of the tire makers that the price reductions will stimulate business, although others in the trade believe it will have no such effect. Sales of the United States Tire Company are said to have been showing steady gains for some weeks and have been well ahead of the production schedule. Business for April was well ahead of the same month a year ago, and the spring trade outlook is promising.

The Hood Rubber Company recently began working on the full shifts for the first time since last fall. Orders will be sufficient, it is expected, to warrant maximum production for the remainder of the year.

The Latest Report of Townley's State Bank

CONTINUED liquidation of their liabilities to the state bank on the part of private banks, heavy withdrawals by treasurers of political subdivisions and increased loans to state industries are revealed in the April report of the Bank of North Dakota, a copy of which has been received by this paper.

Private banks continued to liquidate their liabilities to the Bank of North Dakota during the month. Their total liabilities were decreased in thirty days by $669,792.08. In March 15 the total of liabilities was $6,613,928.74, while on April 15 this liability had been cut to $5,944,136.66.

Comparing the April liabilities with those of November 15, 1920, the last statement prior to the time the initiated law became operative, it is disclosed that private banks have decreased their liabilities to the state bank by $7,218,746.90. They have liquidated at the average rate of about $1,400,000 a month.

Another notable feature so far as the relationship of the private banks to the state bank is concerned is the fact that on April 15, 573 banks owed money to the state bank, while on March 15 there were 641 banks that owed money. Sixty-eight banks cleaned up all liabilities in the one month, while since November 15 last, when 805 banks were listed as depositary banks—232 banks have liquidated all their liabilities.

The liabilities of the private banks to the state on April 15 were made up of $3,474,969.29 of redeposits; $2,222,856 of loans and $246,321.15 of cash items out for collection. On March 15 the redeposits were $4,038,439.75, the loans were $2,312,865.05 and the cash items in transit were $289,542.46.

In the month redeposits decreased $563,480.46; loans decreased $90,008.83 and cash items in transit decreased $16,302.79.

Treasurers Quit the Bank

The record of deposits by public treasurers is one of the most interesting features revealed by the April report.

Notwithstanding the fact that it has been taxpaying time and the average public treasurer has more money than he has had for several months, there has been a decrease in one month of $1,450,884.50 in the deposits from the treasurers.

On March 15 the total of the deposits by the political subdivisions was $7,246,813.65, being made up of $3,687,648.42 in deposits subject to check and $3,558,165.23 in sinking funds on time deposit.

On April 15 these deposits had shrunk to $5,795,929.15. This included $2,860,129.54 of deposits subject to check and $2,935,799.61 on time deposit.

This shrinkage, representing as it does the decision of public treasurers no longer to do business with the bank, is more significant when it is realized that the deposits by the treasurers of the state decreased from $3,109,475.77 on March 15 to $3,658,027.37 on April 15. In other words, like the compulsory deposit clause which governs only state loans at this time tended to increase the state bank's deposits, treasurers over whom the bank has no control elected not only to decline new deposits, but they were successful in withdrawing approximately $1,800,000.00 already on deposit. These withdrawals were accomplished almost entirely, probably wholly so, through the fact that the supreme court refused to uphold the bank's position, taken in the Sargent county and other cases.

Referring back to the time prior to the passing of the initiated law, doing away with compulsory deposit of all funds in the bank, the total deposits of the bank from treasurers of political subdivisions and of the state were $14,924,587.67. These deposits have declined to $9,454,001.52 on April 15. The decrease is approximately $5,500,000.

All of this decline has been accomplished through withdrawals by treasurers of subdivisions. The deposit by the state treasurer was, in fact, greater on April 15 than it was on November 15.

Digitized by Google

The fact that the sinking fund deposits by public treasurers have declined from $3,559,165.23 on March 15 to $2,935,799.61 on April 15, a drop of $623,365.62 is further evidence of the fact that bank officials have given up the contention that the treasurers were without authority to withdraw the sinking fund deposits. This is the position taken during the investigation by the house of representatives' special audit committee. It was contended at that time that the Bank of North Dakota was in a fiduciary capacity and could not consent to any withdrawals of sinking funds, notwithstanding the fact that the compulsory depositary act had been vetoed by the people.

Still Finance Industries

Another phase of the report which goes to show that the bank still is engaged in the business of financing state departments and industries from funds raised by taxation and other purposes is found in the items due from state and public corporations.

Direct loans to the industries such as the mill and elevator and the home builders increased $5,000 in the month and are now $1,200,000.

In addition to this, under the head of "cash items due from the state and public corporations," there is $155,278.62 listed on April 15, as against $36,720.37 on March 15. This increase of $118,558.25 represents advances made by the bank for various purpose.

Heretofore this item has generally been transferred into the form of a direct loan to the state industry commission. It has been the custom to make an advance of money from time to time and then subsequently transfer these advances into a permanent loan.

Cash on Hand

Cash on hand in the state bank was fixed at $97,141.84 in April, as against $86,510.18 in March, an increase of $10,631.66. Deposits in correspondent banks outside of the state increased from $289,542.45 in March to $320,656.54 in April, or $31,114.09.

The summarized statement of condition issued by the bank follows:

RESOURCES

Bonds, United States, state and county	1,951,938.75
Loans to banks	2,222,856.22
Loans on warehouse receipts	70,001.06
Loans to public institutions and departments	1,200,000.00
Loans on real estate	2,810,134.71
Interest earned (net) and uncollected	223,696.58
Furniture and fixtures	52,340.40
Due from 573 depositary banks in North Dakota (redeposits)	3,474,959.29
Due from correspondent banks outside of North Dakota	320,656.54
Cash items due from banks in the state	246,321.15
Cash items due from the state and public corporations	155,278.62
Cash on hand and cash items	97,141.84
Total resources	$12,885,385.18

LIABILITIES

Capital	$ 2,000,000.00
Surplus	40,000.00
Reserve to repay legislative appropriation	24,108.87
Reserve for depreciation on furniture and fixtures	11,966.46
Net profits, 1920	121,483.17
Net profits, 1921	8,524.17
Appraisal fees	4,774.23
Individual deposits	247,937.32
Cashier's checks	234,004.89
Public deposits, sinking funds	2,935,799.61
Public deposits, general and other funds state treasurer	3,658,072.37
Public deposits, general and other funds, county, city, township and school treasurers	2,860,129.54
Due to depositary banks (reserves)	514,326.61
Collection items	25,060.76
Registered checks	139,705.18
Bills payable	None
Total resources	$12,885,385.18

STRAIGHT LINE METHODS

Profit

The life and vitality of all business is Profit.

Success depends upon it. It is the compelling interest in the simplest transaction—the dominant thought in the greatest commercial enterprise.

And yet, one-third of the three hundred thousand manufacturing concerns in the United States, it was estimated prior to the War, earned no profit above normal interest on their investment. And ninety per cent of that three hundred thousand did not even know what it actually cost to produce their products.

Blind business! Ignorance and guess work in the place of *knowledge*—so easily obtained thru the application of simple and sound methods of Cost Accounting, more necessary today than ever before.

With material and labor cost changing over night, sales volume fluctuating, prices indefinite, markets uncertain — *safeguard your Profits.*

Exact knowledge of costs, based on Facts and figures, and intelligently applied by an experienced and competent organization is *the only means of insuring Profits*—

The only basis on which *to increase Profits*—

The only *guarantee of Profits*—

MAY FRANKLINS SOLD OUT

The report comes from the Franklin factory at Syracuse that as early as May 10 the entire production for May had been sold out, with the exception of twenty-one cars. That means every one of the 920 cars to be built in May will be in the hands of customers or en route to customers by June 1. One of the most hopeful signs of the times, moreover, in the opinion of officials of the company, is that this business was widely distributed over the entire country. Since February 10 the Franklin factory has been running 100 per cent normal and has been turning out forty cars daily. During the month of April Franklin dealers placed in the hands of customers 944 cars.

WILLYS-OVERLAND ELECTION

The following have been elected directors of Willys-Overland, Inc., Toledo: John N. Willys, W. P. Chrysler, C. B. Wilson, J. E. Kepperley, J. R. Harbeck, E. R. Tinker, Elisha Walker, Edward F. Swift, Rathbun Fuller, C. B. Mertz, George R. Spencer and C. E. Killinger.

Mr. Willys, who presided at the meeting, said the company had $6,700,000 in cash and that inventories had been cut to $38,000,000. He explained also that the company owed $20,000,000 less today than it did a year ago. The annual report, he asserted, would show a nominal profit for the year.

The stockholders authorized elimination of the company's finance committee and an increase in the executive committee membership from five to seven. The work of the committees is to be combined, it was announced.

CHEVROLET ADDING 1,200 MEN

Announcement was made last week by C. F. Barth, general manager of the Chevrolet plant at Flint, that the factory force would be increased by 1,200 to 1,500 men within the next two weeks, with all departments operating on full time. The increase in operations, Mr. Barth said, was the result of a rush of orders following the recent price reduction.

JENKINS HEADS BIJUR SALES

The Bijur Motor Appliance Company, Hoboken, N. J., announces the appointment of S. S. Jenkins as general sales manager. Mr. Jenkins formerly was the Detroit district manager for the company.

COLLINS BUYS A PLANT

R. H. Collins, who resigned recently as president and general manager of the Cadillac Motor Car Company, Detroit, effective July 1, has purchased part of the old Cadillac plant in Cass avenue and will manufacture automobiles in it, according to announcement made last week. The Collins company will be allied with Durant Motors, Inc.

GOETHALS WITHDRAWS

The working agreement between George W. Goethals & Company and the Pierce-Arrow Motor Car Company, Buffalo, having been terminated, George W. Mixter has severed his connection with the former to continue as president of the latter. The Goethals company was employed to reorganize Pierce-Arrow production on a peace basis and revise the line of product. This task has been accomplished.

In explaining the deficit of Pierce-Arrow for the first quarter of this year, the Boston News Bureau says it was due principally to the decrease in truck business. Beginning early in April, the company experienced a decided improvement in demand for passenger cars and during the month received orders to keep its passenger division operating at close to capacity up through June. Within the last two weeks, however, increasing sales resistance has been felt and demand has fallen off considerably from the April average. In the motor truck end, while there was some improvement in April, it has not continued.

METZGER OPENS SALESROOMS

The Willis Sainte Claire Company of Michigan, distributor for the new Willis Sainte Claire motor car, opened its salesrooms in the former Ford branch building at Woodward avenue and Grand Boulevard, Detroit, Monday. William E. Metzger is president of the company and William B. Hurlburt vice-president and general manager. Mr. Hurlburt, who was associated with Mr. Metzger in one of the first automobile salesrooms opened in Detroit—in Jefferson avenue, in 1901—resigns as assistant to the director of sales of the Maxwell Motor Company, Inc.

ON A 75 PER CENT BASIS

The Michigan Brass & Iron Company, Lansing, which makes a specialty of automobile and truck work, reached a 75 per cent basis

GOODYEAR REINCORPORATES

The Goodyear Tire & Rubber Company, Akron, recently reorganized, has filed new incorporation papers with the secretary of state of Ohio. The capitalization is given as follows: $140,010,000 of preferred capital stock and 1,500,000 shares of non-par common. The plans further provide for $30,000,000 of 8 per cent, twenty-year first mortgage bonds, and $20,000,000 of eight per cent ten-year debentures. The preferred stock is divided into $100,000,000 of seven per cent ordinary preferred; $40,000,000 of eight per cent prior preferred and $10,000 of six per cent management preferred.

The new interests in charge of Goodyear have announced the completed permanent organization of officers and directors. E. G. Wilmer, Milwaukee, vice-president of the Steel & Tube Company of America, has been elected president; C. M. Sandstrom and Paul W. Litchfield remain as vice-presidents; H. H. Springford is treasurer, and C. A. Stillman, secretary. The board of directors incindes Ralph Van Vechten, vice-president, Continental & Commercial National Bank, Chicago; J. R. Nutt, president, Union Trust Company, Cleveland; J. B. Cotton, of Franklin, McAdoo & Cotton, New York; Grayson M. P. Murphy, New York; A. A. Schlesinger, president Steel & Tube Company of America, Milwaukee; Robert C. Schaffner, of A. G. Becker & Company, Chicago, and the Messrs. E. G. Wilmer, G. M. Stadelman, P. W. Litchfield, H. H. Springford and C. A. Stillman.

The new president of the company is said to have been selected by the bankers interested in the financing of the Goodyear company, after a list of twelve of the most prominent business leaders in the country had been investigated. Mr. Wilmer, is only 38 years old, but has been identified with the steel, mining and chemical industries several years.

REPRESENTED IN FRANCE

In a recent issue of the Review, published by the American Chamber of Commerce in France, there is a list of American automobile, motorcycle and tire manufacturers having either an agency or a representative in France. The list mentions the following: Buick, Cadil-

HILLER LEAVES TRIANGLE

Glenn B. Hiller, who has been assistant general manager and director of sales and advertising of the Triangle Motor Truck Company, St. Johns, has joined the American Motor Truck Company, manufacturer of the Ace trucks, Newark, Ohio, as general sales manager.

NEW GASOLINE MOTOR PERFECTED

Muskegon, Grand Haven and Holland men have organized the Rupright Engineering Company to manufacture and market the Rupright gasoline motor invented by Frederick Rupright, Grand Haven, after 17 years' experimentation. The motor under the Pony brake test delivers 42 horsepower on a quart of gasoline in twenty-five minutes. Running 1,600 revolutions, the motor gained speed under this pressure. There is no compression on the crank against the ring cylinder. It is balanced centrifugally, firing four ways from the center. Its plan does away with vibration and uses less gas and two times the horsepower.

James A. Hoover, of the Heinz Pickle Company, Holland, is president; Frederick Rupright, Grand Haven, vice president; C. E. Miner, Grand Haven, secretary and treasurer.

BARTLETT RETURNS TO SPLITDORF

M. W. Bartlett, who since 1919 has been an executive of the Wire Wheel Corporation of America, and who from 1911 to 1919 was with the Splitdorf Electrical Company, Newark, N. J., has returned to the latter organization in the capacity of vice-president and general manager. During the six years previous to leaving this company he was acting secretary and in charge of the foreign business.

Michigan Auto Dealers Organize Association

Passenger car, motor truck and accessory dealers in Michigan are now organized in an association to be known as the Michigan Automotive Trade Association. The organization was accomplished last week during a two-day conference in Hotel Statler, Detroit, conducted under the auspices of the National Automobile Dealers' Association, of which Harry G. Moock is manager and P. F. Drury assistant manager.

Speakers at this conference were as follows: Harry Meixell New York, whose subject was automobile legislation; Albert A. Deane, vice-president of the General Motors Acceptance Corporation, financing automobile sales; Jesse A. Smith, Milwaukee, president of the National Automobile Dealers' Association; F. W. A. Vesper, St. Louis, past president of the N. A. D. A.; Guy S. Garber Saginaw, vice-president of the N. A. D. A.; P. E. Chamberlain, selling service; Wayne Hearne salesmanship.

Guy S. Garber, Saginaw, was elected president; Richard E. Fair, Kalamazoo, vice president, and Clark Graves, Lansing, treasurer. H. H. Shuart probably will be secretary. The directors chosen are G. E. Northrup, Grand Rapids; James Woodward, Battle Creek; J. J. Tompkins, Saginaw; George Simmons, Flint; F. E. Hathaway, Muskegon; Leslie Shearer, Benton Harbor, and Walter J. Bemb, Detroit.

INTERNATIONAL MOTOR TRUCK

During the quarter ended March 31, 1921, the International Motor Truck Company, New York, made a net profit of $4,396 after taking care of taxes, charges, interest, etc. Orders are said to be coming in steadily and indications are that sales during the second quarter will be the rate of 6,000 trucks a year. January was the low month of business, while the April trade was the best since September, with the exception of November.

ZUPPKE COMES MAY 27

Coach Zuppke, of the University of Illinois football team, and Dean Thomas Arkle Clark have been invited to meet with the Detroit alumni of the University at a dinner to be held May 27 at 7 p. m. at the Elks club. All alumni and former students of the University are urged to be present. Tickets may be obtained from W. F. Bollinger, 1205 Dime Bank building, or Phil S. Hanna, 611 Free Press building.

NEW POWER PLANT IN DETROIT

The Detroit city council has authorized the expenditure of $5,000,000 for the construction of a power plant to furnish power for the municipal electric street railway system, and between five and six acres of land have been set aside at the foot of Twenty-fourth street for the plant.

STEEL TREATERS HEAR WHITE

The annual meeting of the Detroit Chapter, American Society for Steel Treating, was held at the Detroit Board of Commerce today. The principal speaker was Prof. A. E. White, Ann Arbor, president of the national society. The Detroit chapter presented an honorary membership to Prof. E. D. Campbell.

MORE PONTIAC STOPS ASKED

Extension of operating rights is asked of the Pontiac city council by Alvin S. Place and Oliver Fiddler, who have a motor bus line between Pontiac and Detroit. The council of the former city has restricted the stops at which the buses may take on and discharge passengers. The operators complain that their stops are commonly used as parking places by motorists. They ask permission to extend the number of stops in the city and also to have certain locations reserved to them exclusively. The council committee on transportation has the matter under advisement.

ILE WANTS A BUS LINE

A plan for closer co-operation between the city of Wyandotte and Grosse Ile was inaugurated at a meeting of citizens of the two municipalities at Grosse Ile, last week. The Ile residents asked the co-operation of the Wyandotte Board of Commerce in obtaining a six-train daily service to Detroit on the Michigan Central Railroad, a bus line from the island to Detroit and improvement in telephone connections and service

$6,000,000 MORE FOR ROADS

If the 1921 legislative trunk line mileage is to be improved it will be necessary for the state highway department to ask for $6,000,000 more or change its present $50,000,000 program. This is to provide for about 6,300 miles, of which 300 miles are within cities or villages. The legislature in four bills added 515 miles to the system.

One of the bills establishes the Philip T. Colgrove trunk line highway with a mileage of 428.7 miles. Its main line begins with the southern boundary of the state, running north through Three Rivers to Kalamazoo, thence to Hastings, Ionia, Stanton, Ithaca, St. Charles, Saginaw, and terminates at Port Sanilac, on Lake Huron. There are several small branches from this main line. The longest one begins at New Buffalo, runs to Niles, Cassopolis, Three Rivers, Union City and ends at Jackson.

The other bills provide for 50 miles of trunk line road from Ithaca through Alma and Mc Bain, connecting with the trunk line road between Cadillac and Lake City; twenty-one miles from Paw Paw to Allegan and fifteen miles from Monroe City to Ohio state line to help care for the heavy Detroit-Toledo traffic, which now goes over the one road which means a high cost for Monroe county in maintenance. This new road would be of concrete and the cost of construction and maintenance would be borne by the state. The construction cost would be $49,000 a mile, or a total of $600,000.

The remaining new mileage probably would be of gravel and cost an estimated total of $5,000,000. There are about 2,000 miles of improved roads, leaving 4,000 to be built by the 1919 bond issue. With the exception of the Monroe highway, the new roads authorized will probably not be constructed for two years, since no provision was made for maintenance in that time.

JACKSON TO IONIA

Hawkes & Porter, Jackson, announce the establishment of a motor bus line between Lansing and Ionia, making two round trips daily, including Sundays.

ANOTHER LANSING LINE

Lansing's fourth intercurban bus line has been started between that city and Howell, by Homer Tripp, Lansing. Three round trips are being made daily, the last being timed to accommodate evening theater goers. Buses now operate out of Lansing to Charlotte, Grand Ledge and Williamston, in addition to the destination of the new line. A resort service is also operated in summer to the suburban amusement parks.

DETROIT TO JACKSON

The McKinley Cartage Company, Detroit, has established a motor truck service between Detroit and Jackson. Trucks will make the trip every other day. The company expects to handle shipments of all kinds and volume.

TO CARE FOR PUPILS

The school authorities of Bear Lake, Manistee county, have called a meeting at the schoolhouse in that town, May 23, to consider purchase of equipment for six bus lines to transport school children to and from school, covering all the outlying district. Bus service for pupils has been in existence for some time and is now about to be revised, to overcome certain problems in connection with routings and to take care of increase in traffic. A number of school districts will be served by the lines.

CONSTITUTION COPIES READY

The constitution and by-laws of the Michigan Highway Transportation Association have been published and are now ready for distribution. Those desiring copies should apply to H. H. Hardy, secretary, at the Fireproof Storage & Transfer Company offices, Lansing. The Association is pushing its membership drive and meeting with success. There will be a meeting of directors next week to further membership efforts.

ASHLEY & DUSTIN SCHEDULE

The Steamer Put-in-Bay, of the Ashley & Dustin line, will make the first trip of the season to Put-in-Bay and Sandusky, Sunday, May 29, O. S. Dustin, traffic manager of the line, announced Saturday. The same trip will be made Monday, Memorial Day, and the following two Sundays, June 5 and June 12. Starting Sunday, June 19, daily trips will be made from Detroit to Put-in-Bay, Sandusky and return.

The Put-in-Bay will leave the wharf at the foot of First street, Detroit, at 9 o'clock in the morning, Eastern time, and will arrive in Put-in-Bay at noon. It will arrive in Sandusky on its return trip at 2 p. m. Starting from Sandusky on its return trip at 2:30, it will stop at Put-in-Bay at 4:30 and will arrive back in Detroit at 8 o'clock.

On Saturday evening, May 28, the first moonlight of the season will be given on Lake St. Clair. Moonlights will be run Sunday, Memorial evening, and daily each evening thereafter. The Ashley & Dustin line will run moonlights every Wednesday, Thursday, Saturday and Sunday. The steamer has been chartered for the entire season for moonlights by private organizations every Monday, Tuesday and Friday.

ESTABLISHES AD. DEPARTMENT

To aid printing houses, direct advertising concerns, advertising agencies and other businesses allied with the paper industry, the Seaman Patrick Paper Company, Detroit, is establishing a complete sales promotion and advertising department. The new division is under the management of Dan B. Jacobs as director of advertising. Mr. Jacobs has been associated for a number of years with several prominent direct advertising houses and advertising agencies.

P. M. President Issues Appeal to Buy Coal Now

President Frank H. Alfred, of the Pere Marquette Railway, has issued an appeal to manufacturers and coal dealers on the Company's lines with reference to the fuel situation for the coming winter. He advises summer delivery of next winter's supplies. The appeal is as follows:

"The Pere Marquette Railway has just completed contracts for company coal for the ensuing twelve-month period, and we are already storing fuel for next winter's operation, and this prompts me to appeal to manufacturers and coal dealers to begin to buy and store coal in adequate volume, rather than to wait until later in the year.

"The recent mild winter may make us a little negligent in this respect, but we have no assurance that similar conditions will prevail during the winter months of 1921-2.

"The coal-carrying equipment of the railways is only sufficient to carry an evenly balanced tonnage. It is not adequate to handle the movement when it is thrown upon the transportation machine in a comparatively short interval.

"There is another side to this question also. The mines have their limitations. They are able to make deliveries now. What they may be able to do later is a problem that only time will solve. We have, in the past, bent every effort to educate the public to lay in its stock of fuel and other supplies, such as raw materials, during the summer months— an appeal which in certain cases has produced an increased movement in those months when transportation conditions are at their best. Those manufacturers who have taken heed of the appeal have not suffered disappointments, delays or loss of business.

"So in again making an appeal for summer delivery of next winter's supplies we can point to concrete instances of good business in the case of those who heeded it in the past; likewise of disappointments and losses to those who failed to take advantage of the warning.

"There are economic advantages, too, in purchasing coal for winter use during the summer months and two of these are of the greatest importance:

"The usual lower prices that prevail during the summer months.

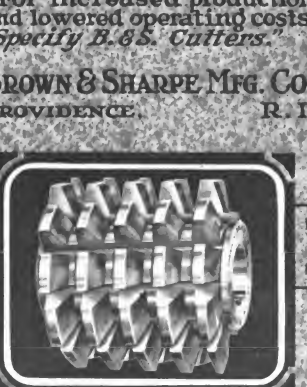
"The certainty of timely delivery.

"We are all hopeful of better business conditions returning shortly and so in moving every ton of freight possible during the summer months when the transportation machine is at its maximum of efficiency, we can then dispose of the worries about its adequacy to meet the demands of a returned prosperity."

REO TO BE HOST TO TOURISTS

The Reo Motor Car Company, Lansing, will be host to the members of the tour party of the Michigan Pikes Association, July 9, for the first night's stop of the annual good roads tour of the "Pikers." The tour will leave Detroit at noon Saturday, July 9, for a fifteen-day good roads campaign through Michigan, Wisconsin, Minnesota and Ontario, totaling 1,700 miles.

Lansing will also do its share toward entertaining the party, through the co-operation of the Lansing Chamber of Commerce and the Lansing Automobile Club. The two bodies are planning a good roads rally on the Capitol lawn.



The tourists on the "Around Lake Superior" jaunt will not use tents as they did a year ago on their first International good roads campaign, but will carry folding cots and blankets and sleep in buildings. The Reo company will quarter the tourists in the Reo club house and the factory's driveway garage. Both dinner and breakfast will be served in the factory cafe. R. H. Scott, general manager, and R. C. Rueschaw, general sales manager, will represent the Reo company.

Detroit—Realizing the financial difficulties of the railroads at this time, representatives of the Masters, Mates & Pilots Association and the Marine Engineers Beneficial Association at a meeting held at Detroit May 12 with the Pere Marquette, Ann Arbor, Wabash and Grand Trunk Railway officials voluntarily accepted a reduction of 15 per cent from the present schedule, effective May 16. This reduction is accepted pending the settlement of the wage schedules for licensed officers which is to be settled by the agreement made by the Shipping Board and representatives of the Masters, Mates & Pilots Association and the Engineers Beneficial Association. All working conditions remain the same as in 1920. The agreement affects the masters, mates, pilots and engineers on the trans-lake ferries operating on Lake Michigan and the Detroit and St. Clair rivers. The unlicensed employes who include the deck hands, firemen, oilers, watchmen, wheelsmen, etc., had consented to a reduction effective April 15.

Saginaw—Through-car freight service for Alpena, Cheboygan, Onaway, Rogers City, Metz, Posen and other northern Michigan places has been arranged by the Pere Marquette Railway in co-operation with the D. & M. railway, according to word received by Donald MacDonald, traffic manager of the Board of Commerce.

Washington—The Interstate Commerce Commission has given the Detroit, Toledo & Ironton Railroad permission to extend its lines 15 miles in Wayne county, Michigan.

ROAD BIDS TO BE OPENED JUNE 2

Sealed proposals will be received at the office of the Shiawassee county road commission, at Corunna, on June 2, at 1:30 p. m., by Frank M. Rogers, state highway commissioner, for improving 3.532 miles of road in Shiawassee county as follows: Road No. 21-5, 1.803 miles in Corunna city; Road No. 21-11, 0.789 miles in Caledonia township, and Road No. 21-10, section B, 0.940 miles in Owosso city.

The work will consist of shaping the roads, constructing the necessary drainage structures and surfacing to the width of twenty feet with concrete. Alternate proposals will also be received for surfacing with bituminous concrete.

Plans may be examined and specifications and proposal blanks obtained at the office of the road commission at the court house in Shiawassee county, or at the office of the state highway department in Lansing.

Proposals will also be received at the same time and place by the common councils of Owosso and Corunna for the construction, in excess of the twenty feet in width, through part of these cities. A certified check of $500 must accompany each bid.

WALDON HEADS ROAD BOARD

Col. S. D. Waldon, Detroit, was elected chairman of the good roads board of the American Automobile Association at the final session of the annual convention, May 17. Col. Waldon succeeds George C. Diehl, elected president of the A. A. A. Mr. Diehl had been chairman of the good roads board ten years.

DETROIT AIR SERVICE PLANNED

The Great Lakes Seaways, Inc., composed of Detroit and Cleveland business men, will establish air service between Detroit, Cleveland and Pelee Island, June 1, according to announcement. Three heavier than-air machines of the seaplane-limousine type, with a capacity of five passengers and 1,500 pounds of freight each, will be used on the route. Rex L. Uden formerly a member of the British air forces, and member of the Ohio Air Commission, is vice president of the company. This is the second attempt to establish air service to and from Detroit.

CONSOLIDATED INSTRUMENT OFFICE

The Consolidated Instrument Company of America, 661 Eighth avenue, New York, has opened a Detroit branch office in the Empire building, in charge of J. H. Lytle. The company manufactures speedometers, tachometers, speed indicators and Tel Odometers.

MAXWELL SALE AFFIRMED

In federal court in Bay City, May 17, Judge Arthur J. Tuttle confirmed the sale of the Maxwell Motor Company, Inc., on the acceptance by the reorganization committee of a stipulation that they stand individually liable to preferred stockholders of the old company who have protested the sale, in the event the court finds the scaling down arrangement inequitable.

The suit of the intervening preferred stockholders was dismissed. W. Ledyard Mitchell will continue as president of the company and it is expected that the settlement as confirmed will result in placing the Maxwell and Chalmers companies on a very substantial credit basis.

Progress, Projects and Contracts of the Week

Grand Rapids—The high mark for permits for one week thus far this year was reached during the week of May 6, when 108 certificates were taken out. This is 17 in excess of the previous high weekly record. The cost of the buildings to be erected is $99,775. Of the 108 permits, 16 were for new construction and 53 for private garages or automobile sheds. Most of the more important permits were for dwellings.

Detroit—School and store buildings, a new clubhouse for the Detroit Yacht Club and some minor contracts figure in the weekly list of contracts awarded by architects as compiled by the Builders and Traders' Exchange. The list of projects in the hands of architects contains a variety of proposed construction, such as a market building, a church, four school buildings, a high pressure pumping station, a service garage and a number of stores and flats. Further information may be had at the Exchange's offices.

Berrien Springs—Excavation work on the new factory of the Calbert Company has been started. O. J. Carlyale, Chicago, one of the proprietors, is in the city to supervise the work, which is expected to be completed within thirty days.

Detroit—The Austin Company, contractor, began construction Monday of this week on a garage for the Detroit Motorbus Company, at the foot of Terminal street. The building will be 120 by 240 feet in dimensions, one story, and of steel and brick construction. The cost will be about $75,000. The Austin Company will put up the structure complete. The job will be done in forty working days.

Bessemer—The city shortly will begin work on a hotel to cost $100,000. Information regarding bids may be had from Levi S. Rice.

Laurium—Bids will be received by the Soldiers and Sailors' Memorial Association, of this city, up to June 1 for the erection of a hospital. The foundation of the building has been completed. For further information addre.s James T. Fisher, Laurium.

Detroit—During April the Detroit city department of buildings and safety engineering issued 1,509 permits for new buildings, as compared with 2,227 in April, 1920. Construction cost involved was $5,079,450, as against $11,189,325 a year ago.

Wyandotte—As the result of a "get-together" meeting of the Wyandotte city commission and the Ford Village council, the North Line road will be paved, making another line to Fort street. Bids for the work will be asked soon.

Cheboygan—The county road commission this week advertised bids on the construction of six and a quarter miles of paved highway on trunk line No. 10 between Cheboygan and Aloha. The first bid received for the work was made by a local contractor and called for $18,000. Others averaged between that figure and $48,000.

Detroit—Brandon & Hanna, Detroit, were the low bidders, among ten, this week, on the construction of the Bates street sewer, in Brush street between Alfred street and Canfield avenue. Their bid was $583,402, without compressed air equipment, and $616,138 if compressed air is used. The sewer is to be twelve feet, nine inches in diameter. Jenyes and Afield were the low bidders on the Seven-Mile road sewer, from Woodward to Parkview avenues, at $219,876.

D. A. D. A. SERVICE FORUM

The first of the series of service forums to be conducted by the Detroit Auto Dealers' Association on a plan provided by the National Automobile Dealers' Association, was held Tuesday evening in the new service building of the Cadillac Motor Car Company, Detroit. The subjects were rear axles, motors and clutches. The instructors on the proper care of these units were as follows: Engine, Paul Lundy, Continental Motors Corporation; rear axles, Harry K. Rotert, Timken-Detroit Axle Company; clutches, C. M. Ahlene, Borg & Beck Company.

DUTCH HEADS FIRESTONE BRANCH

J. H. Dutch, formerly in the manufacturing department of the Firestone Tire & Rubber Company, has been appointed branch manager in Detroit.

Bowen Becomes Secretary Of Associated Employers

Charles A. Bowen, who for eight years was secretary of the Detroit Builders' & Traders' Exchange, and for four years—until April 1, 1921—secretary of the National Retail Lumber Dealers' Association, has been elected secretary of the Associated Building Employers of Detroit. Since leaving the retail lumbermen's

CHARLES A. BOWEN

association—a connection he severed because he did not wish for personal reasons to remove to Chicago when the headquarters was transferred to that city from Detroit—Mr. Bowen had been manager of the bond department of Wynne & Kinsella.

The Associated Building Employers of Detroit is an organization of many of the principal contractors whose object is to further the American plan of employment. N. J. Kennedy is president. Offices are at 2002 Real Estate Exchange building.

New Sand and Gravel Freight Charges Fixed

The Michigan Public Utilities Commission late last week revoked its order of April 22, 1921, and established a new freight rate schedule for sand, gravel and crushed stone. The new rates are based on zone mileage and apply only to the Lower Peninsula.

While the original order made a flat reduction on all schedules of twenty-five per cent in the Lower Peninsula and twenty-two per cent in the Upper, the new reduction is from eleven to thirty-five per cent. In the Upper Peninsula the rates will revert back to their original figures prior to the last order, no complaints having been received from that region. However, the commission will hold a hearing at Marquette, Thursday, May 26, at 10 a. m., on the Upper Peninsula rates.

The new order became effective May 20, 1921, at midnight, and applied only to sand, gravel and crushed stone for certain purposes, and not for such products to be used in foundries or in the manufacture of glass, fertilizer, chemicals or cement. The Commission holds that the rates have been illogical and the forty per cent increase of August, 1920, made them more so, and that the only fair way to make a reduction was on the basis of a classification by zones. The Commission believes the new rates will result in a more uniform treatment of the population in the Lower Peninsula.

Only higher rates are reduced. Rates below the basis are to remain as they are. Where the freight is hauled over two lines, twelve cents shall be added to the one-line rate, and over three lines, twenty cents. Switching charges are not included in the order but will be covered in a supplementary one.

The new rates, in terms of cents per ton, one-line rate, is as follows: five miles and under, 55; ten miles and under, 60, and so on up to thirty miles and under, which is 80 cents. From thirty miles to 100 miles, in steps of ten miles each, the rate also increases five cents in each instance, at 100 miles being $1.15. From 100 miles to 145 miles in steps of fifteen miles each, from 145 miles to 205 miles, in steps of twenty miles each, and from 205 to 300 miles in steps of twenty-five miles each, there is the same scale of increase in the rate of five cents in each instance, at 300 miles the rate being $1.65 a ton.

In the zone for Detroit the new schedule means a reduction in the rate for the shortest haul from 84 to 75 cents a ton on silt sand and gravel from surrounding points transported into or near the city, this being a reduction of 11 per cent. A large part of all the sand and gravel freight for the Lower Peninsula is transported in the Detroit zone. The rate will determine by competition the rate for all longer hauls as is now the case.

For Grand Rapids, with hauls from seven surrounding points, the reduction in rates runs from twenty-three to thirty-five per cent. There are 4,000 different rates in the state, only a part of them being before the Commission, but on the basis of those in evidence the average reduction in these rates is twenty-two per cent. This does not mean, however, that the actual revenue to the railroads will be reduced twenty-two per cent, for it will not. The smaller reductions, for example Detroit, represent a huge portion of this business, and hence the freight charges will be cut down only a part of that twenty-two per cent on paper.

TO RESURFACE DIXIE HIGHWAY

A stretch of four miles north of the Ohio border on the Dixie Highway will be closed for about six weeks while the road is being resurfaced with stone. When this work is completed the highway will be reopened until the top dressing is laid next year. The contractors report that the roadbed shows comparatively little wear despite the heavy traffic over it.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

STRANGE F

WHEN the Purchasing Agent or Master Mechanic says "No" to your representative, what is behind it? Just this: The President, General Manager or Treasurer—perhaps the banker—of the company has clamped down the lid and is sitting on it.

Still, there is business. We know of one concern here in Michigan which within one year has jumped from producing ten batteries a day to sixty, and making money. We know of another concern, though, that is grinding down drills it has in stock instead of buying new ones to meet its requirements. We know of a salesman who, upon being turned down, went to one of the higher executives and made him see the economy and value of the service he was selling.

Now the only reason these men higher up are holding down the placing of actual orders is "Money"—or rather the lack of it. This means that you have to sell the man who holds the money bag on the value of the investment, based upon its performance.

The war demand resulted in increased manufacturing facilities of about 25 per cent. When the factories are closed down or running on a very much reduced basis they are not wearing out the equipment generally. Instead they are placing "piecemeal" orders. There probably won't be a general buying demand for some time to come, but there are thousands of small replacement and new installation orders to meet the requirements of changed manufacturing conditions. This means stiff competition, because everyone is out with salesmen after business now.

What is going to help your salesmen get the advantage over your competitor?

There is more business in Michigan than in Montana for you. This publication is a business paper appealing primarily to executives. In fact, the executives of practically every plant in Michigan employing fifty or more men are its readers, as well as are the majority of bankers.

Since the first of the year we have been running articles on specific mechanical operations in the fabrication of metal and wood products, focusing the attention of the manufacturers of the state upon the equipment necessary to various lines of manu-

SYCHOLOGY

facture. We have been laying the foundation for the consideration of the products you make.

One of the big points in our circulation is the fact that not only the executives but the men in the shop and the department heads are looking to our columns for information on subjects vital to them. That is why such concerns as Dodge Brothers, Detroit; Hayes Wheel Company, Jackson; Wilson Body Co., Detroit and Saginaw, and hundreds of other Michigan manufacturing concerns have individual subscriptions going to the homes of their department heads and executives.

We have received a good many cancellations of advertising contracts, but the old established concerns who intend to stay in business are not dropping out. The Brown & Sharpe Manufacturing Company, Providence; Warner & Swasey Company, Cleveland; Union Twist Drill Company, Athol, Mass.; National Twist Drill & Tool Company, Detroit; E. W. Bliss Company, Brooklyn; Geuder, Paeschke & Frey Company and Cutler-Hammer Company, Milwaukee, are still hammering home their messages each week to the men who are sitting on the lid—breaking down resistance by using advertising in our columns.

Strange psychology most every one employs—using double page spreads when they could not take an order, and dropping out when they need orders.

But the exceptions to this practice are meeting with success.

There are many peaks and valleys on the sales charts today, but they won't be flattened out by broadside methods. They will by sharpshooting.

Perhaps we take ourselves too seriously, but that may be the result of our constituency's taking our paper seriously, and we cannot help feeling that with our highly concentrated circulation among your constituency in Michigan and adjoining states, which is the area of influence of our paper, there is an economy and a directness of appeal offered to you through a campaign of advertising in our columns.

If you think so, too, we will be very glad to furnish you our advertising rates and make a further analysis as to the value our paper may have for your particular product.

DETROIT, SATURDAY, MAY 21, 1921

Tying Up Farm and City

IT IS RATHER a new idea which the Detroit Board of Commerce is trying to work out in its relations with the agricultural neighbors of the metropolitan city. A number of commercial bodies of this state have sought to enlist the interest of the agriculturalists located within range of their respective cities, but the point of contact has usually been some single material thing, such as good roads, the extension of rural free deliveries, or the like.

The program of the Detroit Board of Commerce has as its basis the theory that an industrial city cannot maintain its supremacy unless it is provided with an adequate supply of food at as large a rate as it is possible to supply it. Upon this theory the Board intends to place a super-structure of effort in the direction of the intensification of agriculture within a motor truck radius of the city, for the purpose of inducing the largest possible productiveness of food products from the soil, which can be brought to the point of consumption without having to be burdened with a high short haul railroad rate. Pursuing the theory that every acre available within reasonable distance of the city should be made to pay a tribute of food, a survey of waste lands, whether they be abandoned farms or marshy or swamp land, is to be made, so that the former may be put into use directly and the latter be made available for use by drainage and such treatment as is necessary to make these acres produce food.

Apart from the purely economic end of the program, there is a real demand in Michigan at this time for a better understanding of the industrial cities by the agricultural population. That a misunderstanding exists no one can deny. That the misunderstanding extends even into a spirit of antagonism is witnessed in the constant bickerings between farmers' clubs and the legislature and with the representatives of the industrial cities. The farmers have had their own way for lo, these many years, but the next re-districting of the state will be very apt to show that the industrial cities will have a majority, because the majority of the population lives therein, and it is not a pleasant prospect to contemplate, should the industrialists hand back to the agricultural areas something of the same treatment that the farmers have given the cities in time past.

As a matter of fact, there is no reason for antagonism between the two elements at this time. There may have been in the past when the industrial cities of Michigan could not consume all the farmers produced, and when the lush wheat, corn, oats, rye and barley crops of Michigan found their markets in Chicago and in Toledo, to be passed onward to the more intensely settled sections of the country for consumption. At this time the industrial cities of Michigan are quite competent to consume all the food that is raised on the agricultural areas of the state, with some in addition. This is as true of the flesh meat foods as it is of the cereal, vegetable and fruit types. Michigan is very largely supplied with western beef today, while a recent estimate showed that there are easily 12,000 square miles of land in the 32,000 of the lower peninsula of Michigan which are available for the production of flesh meat food cattle. Even under the present conditions the best beef raised in Michigan does not go to the great city markets in the state, but goes directly to Chicago, there being little demand for this class of food product in the large cities of Michigan. This the farmers themselves are correcting by having established in Detroit a packing industry of magnitude, to which they propose to send their cattle direct, avoiding the shrinkages of stockyards and the charges of commission men. Michigan is a very large producer of meat cattle, but it is not yet a large enough producer. In the states to the west of us a very active system of promotion of the raising of meat cattle is in progress all the time, the youngsters being induced to organize calf clubs, baby beef clubs, pig clubs and the like, all of which add substantially to the number of animals offered for slaughter for the usefulnesses of the meats.

The farmer and the city man in Michigan have a long future of co-operation before them if they will undertake it, and the proposition, which has been handled on a serious scale by the Detroit Board of Commerce, should attract similar organizations in the large cities of this state. It will pay them to watch its progress, note its successes, observe the defects of the plan if there be any, and correct them, and generally get a better understanding between the cities and the producers of food. With the determinate amount of money which has been invested in Michigan roads, and the facility with which movement over them may be accomplished with farm products carried in motor trucks, it will be necessary to have such co-operation in order to produce dividends upon the $50,000,000 which Michigan alone is investing in these roads, and the other millions which the counties and the road districts have invested already, and are adding to. These investments are not made either for ornament or comfort. They are made for utility and there should be a substantial profit realized upon them by the commercial usefulnesses which they should be made to yield.

The Federal Reserve Should Answer

THIS PAPER has been a consistent supporter of the personnel of the Federal Reserve Board at Washington. We have believed that, except for minor changes in functioning, the existing machinery of the Reserve Banks is about as near perfection as is possible to make it. But when a man who was Comptroller of the Currency for seven years makes positive allegations of abuse and partiality on the part of the Board, we think the Board should at least controvert such statements with the facts, or if unable so to do, should acknowledge its errors.

John Skelton Williams got "in wrong" with a great many people, yet the men who worked under him will tell you that he was a most efficient supervisor, that he was fair notwithstanding his overzealousness in some directions and that he returned to the Government in hours of conscientious study and effort many times that for which he was paid. But the vital point is this: he had access to the "inside" of national banks and it must be granted that when he makes statements such as are accredited to him in his Washington speech, April 15, before the Peoples Reconstruction League, it is time for an explanation from those he accuses.

This is not to be taken as an indorsement of his views, but here are two of the javelins which he throws at the Federal Reserve Board:

"The rate charged at one time by a Federal Reserve Bank, under regulations approved by the Board, in one exceptional case to a small bank in a farming section amounted to more than 80 per cent per annum."

"I gave them (the Board) one instance where a certain large bank last summer borrowed money from its Reserve Bank at about 6 per cent per annum, and about the same time loaned a customer, the head of a large manufacturing enterprise, $1,000,000, well secured by collateral, of which loan about $500,000 was passed on to correspondent banks (without liability to the selling

Digitized by Google

bank) at about 12 per cent per annum, and $500,000 of the loan retained on a basis of interest and commission which yielded the lending bank about 200 per cent per annum on its net outlay; the whole loan being paid in full in six months. When that 200 per cent transaction was referred to in a meeting of the Reserve Board, one member, to my amazement, was disposed to condone or defend it on the ground that 'the banks all charge such rates, more or less.'"

In the first case he says a Federal Reserve Bank charged a small bank interest at the rate of more than 80 per cent per annum. In the second case he says a large bank used its membership to earn about 200 per cent per annum on money borrowed from the Federal Reserve. We don't like the sound of this.

Mr. Williams says further: "My attention was called to a case where a bank was charged by its Reserve Bank under the progressive plan from six to 8½ per cent per annum. The average rate which it paid the last two weeks in September for the advance of $112,000 was about 45 per cent."

Of particular interest to the bankers in the agricultural districts is a statement to the Board in his letter of December 28, 1920, in which he said, among other things: "While there appears to be this scarcity of money and of credit in the great agricultural and producing sections of the West and Northwest and in the South and Southwest, we find that individual banks in New York city are borrowing from the Reserve System, in a number of cases, more than $100,000,000 each; and sometimes as much as $145,000,000 is loaned there to a single bank—twice as much as the total loans some of the Reserve Banks have been lending recently to all the member banks in their districts." Also: "I was further painfully impressed by the evidence of the official records that at the beginning of August, 1920, in crop moving time, the national banks in New York city were lending for correspondents on so-called 'Wall street' loans for stock speculations and operations, more than $500,000,000 coaxed from banks everywhere in the country by the high rates speculators would pay. This was more than the Federal Reserve banks of Minneapolis, St. Louis, Kansas City, Dallas and Atlanta were lending to their 1,000 or more member banks."

As the former comptroller sees it from his experience in the office, "Congress should so amend the Federal Reserve Act as to make it not only fool-proof and crook-proof, but immune from the diseases which I coin a word to describe as 'bureaumania.'" In his opinion, the Board has run the System strictly as a machine and has been severely technical regardless of changes of policy of operation which unforseen conditions might dictate.

Those who know the former Comptroller best will know how many pinches of salt to take with his opinions, but when he indulges in specific charges and quotes the figures, the accused should be heard from. In point of number of members the Federal Reserve system is still in its infancy. We hope to see the day when every eligible bank will become a member, but one of the cardinal attractions of membership is the right to participate equally in the benefits of the System. If Mr. Williams' allegations are true, these benefits have not always been impartially bestowed.

Doing Their Own Bargaining

A STATEMENT issued by the Michigan State Farm Bureau admits that the Michigan Sugar Beet Growers' Association has failed once more to sell the crop "collectively" to the manufacturers. Thus has collapsed another attempt on the part of the professional organizers to force the sugar makers to pay more for beets than they are worth; and it is fitting enough that the agitators were licked by the very men they said they were going to serve—the growers themselves.

In 1920, when the manufacturers declined to be stampeded, the association called a "strike." Several hundred growers, so it was claimed, refused to plant. Others signed agreements not to put the crop into the ground but got cold feet when they saw the factories were going to get enough beets from growers outside the association. The result was that nobody was made to look silly except the association itself.

This year the organizers, remembering the rebuke of last season, took another tack. They sent contracts to growers all over the state asking them to make the association the selling agent for the crop in bulk. Some signed but a good many more chucked the contracts into the waste basket or the kitchen stove. When the organizers approached the sugar manufacturers with their bunch of contracts they were met with the assurance that plenty of acreage had been contracted for and there would be "nothing doing" so far as they were concerned. So they have notified those who signed up that they have been released from their obligation, and to make the best terms they can, as soon as they can.

The weak link in the agitators' scheme is that the prices which the Michigan factories are and have been paying are fair and approximately the same as those paid throughout the beet growing districts the country over, and the growers know it. Having dealt with the manufacturers a good many years, they have every confidence in their ability to do their own bargaining, without outside interference.

Short Measure Stuff

FRIENDS, ROMANS, COUNTRYMEN, PLUG UP YOUR EARS

Now Nero was a naughty man,
By histories we're told,
A tyrant and a charlatan
And proud and overbold,
But possibly not wholly bad,
When Rome by fire was shorn,
At most he played a fiddle—
And he didn't toot a horn.
—From Line o' Type, Chicago Tribune.

And Cassius, too, of Roman fame,
Who helped bump Caesar off,
Whose pocket money mostly came
From out the public trough;
Who was the first great Bolshevik,
A traitor and a drone;
At least did not take lessons,
Upon a saxophone.

And Antony, another gnat,
Who left his wife and chile,
To play around with Cleopat'
Along the River Nile;
Who wasted all his precious wealth
Upon the cup that cheers,
Still can't be charged with writing
"My Four Egyptian Years."

"Nineteen twenty-one will reward fighters." Duet from the Dempsey and Carpentier headquarters. "Oh, very well."

* * *

Between the Newberry verdict and the Jewish fiasco, Henry Ford should now be left pretty free to build automobiles.

* * *

The mills will grind a little more freely at the University of Michigan now.

* * *

Have you held a little beauty contest yet? It's quite the rage.

* * *

If you don't like what you're doing, why not build automobiles? The "teach by mail" boys are overlooking a good bet.

* * *

The seaman's law is being swabbed to walk the plank.

* * *

But the British wish they were "Sinn Faint."

FINANCIAL

The Business Outlook

By PHIL S. HANNA

THIS is no time to be feeling blue. It may come to pass that the automotive manufacturers will be obliged to cut down their present rate of production and there may be something to the theory that "this present improvement in business is due to the usual spring revival in automobile sales," but there are more than 45,000,000 people engaged directly and indirectly in the farming business of this country who have been "out of the market" completely these many months since Mr. Ford cut the price of his cars, and the time is almost at hand when we are going to hear from them. And when they begin buying again, be it ever so much less than their normal purchases, business is bound to feel the quickening effect thereof, and they will fortunately come about the time our automobile making friends are scheduled to "depart."

It is now about a year since deflation began. We have witnessed the most gigantic tumble in values the American people have ever known and it has been accomplished without materially injuring our banking fabric or seriously hurting confidence. Why, after witnessing the successful passage of hundreds through crisis which in former periods of liquidation have laid commercial houses and banks low by the hundreds, should we now let the cold chills run down our backs? There are undoubtedly more storms to weather before this thing is over, but with every storm the ship of business rides through with less strain and the skipper becomes a better financial navigator.

Dun's reports of business failures both in United States and Canada show clearly what we have weathered this time compared with 1893 and 1907. In the former year there were 15,242 failures in the United States, with liabilities totaling $346,779,939, and in 1908, the year following the 1907 difficulty, there were 15,690 failures, with total liabilities of $222,315,684. In 1915 there were 22,156 failures, with liabilities totaling $302,286,148, but in the last quarter of 1920 total liabilities alone were $128,544,324, or at the annual rate of about $500,000,000 a year. For the first quarter of 1921 total insolvent liabilities were $180,397,989 covering 4,572 defaults, or at the annual rate of about $750,000,000. We submit that there is much ground for confidence in the showing and when the 1921 insolvency history is fully written we may look back with profound wonder that so large a number and amount of business fatalities were weathered without a greater degree of direct injury to all of us. Canada's showing is similar, there being 566 failures, with liabilities of $22,245,520, for the first quarter of 1921, compared with 209 failures having liabilities of $4,327,174 for the same quarter of 1920.

The four instances of price cuts during the last week—Jordan, Marmon, Chevrolet and Oakland—passed off without half as much notice as the same events would have commanded last fall. And these probably are only forerunners of others which will follow. Three tire companies got in line, too, all of which will not immediately produce the desired results but it is contributing to the eventful swing back of the pendulum toward normal.

The borrowing public should not be misled by the reduction of Federal Reserve discount rate into thinking that money is thereby to be made automatically easier to get. The thing to watch is the liquidation of loans as compared with liquidation of deposits. There isn't a banker in the state of Michigan who wants to pile up a reserve just for the sake of having an abnormally large liquid fund on hand when those funds can be loaned profitably. Between February 21 and April 28 bank loans and investments in Detroit were reduced $12,511,154, while deposits went off $8,787,177; and if—with emphasis on the "if"—this ratio of reduction is kept up the local situation will correct itself. But in cases where a bank is obliged to increase its bills payable (borrowed money) to take the place of deposits drawn out which have not been covered by liquidation of loans and investments, a reduction in the discount rate has about as much effect as reducing the price of rice in Japan.

But notwithstanding the local bank condition we believe there is every reason for feeling cheerful about the future, for the general bank condition the country over, as shown by reports of more than 800 large banks to the Federal Reserve, is improving daily. There are bound to be "spotty" conditions here and there and too much emphasis can not be laid on the fact that if the Detroit banks had not stretched themselves, so to speak, to take care of business when it was offering, they had an average condition so far as bank statistics go. But more than likely average condition would have been passed in the sense of general business and there might not have been the splendid revival which we have witnessed the last sixty days.

FISHER BODY EXCHANGE EFFECTED

Otis & Company announce that the plan for the exchange of common stock of Fisher Body Ohio for common stock of Fisher Body Corporation has been declared operative. Under this plan the holder of each share of the Ohio company stock is entitled to $3 in cash and one-fifth of a share of common stock in the present corporation. Communications are now being prepared asking for the surrender of the receipts. Under the plan the Fisher Body Corporation guarantees the payment of current quarterly dividends upon the preferred stock of the Ohio company down to and including the dividend payable July 1, 1922. It also agrees to pay on or before that date the accrued unpaid dividends on the preferred stock for the year 1920. The dividend accruing April 1, 1921, is expected to be paid by the Ohio company and a meeting of board of directors for the purpose of declaring a dividend will be held before June 1, at which date the dividend is expected to be paid. Holders of the Ohio common had until May 15 to deposit their stock for exchange, when the privilege expired.

PONTIAC CLEARINGS INCREASE

Pontiac bank clearings for the week ended May 12 were $503,058.46, as compared with $428,489.65 the previous week.

G. R. SAVINGS HEADS LIST

It will be noted in the table of bank statistics which appears elsewhere in this issue that the Grand Rapids Savings Bank now heads the Grand Rapids banks in the matter of deposits. Between February 21 and April 28 deposits grew from $10,325,415 to $11,754,317.

Wallace Company Upheld in Injunction Proceeding

Judge Leland W. Carr, of the Ingham circuit court, Lansing, has sustained A. W. Wallace & Company, Detroit, in their injunction proceedings against the Michigan Securities Commission to prevent the suspension of their license because of the sale of certain stock of the Michigan-Colorado Copper Company. While the court held that the Commission had this power to suspend a license, the company was not given proper notice, charges were not filed and it had no chance for a hearing. The question of the ownership of certain stocks was a matter to be decided by court and not by the Commission, the judge held. The decision of the court, however, does not prevent the Commission from taking other proceedings against the Wallace Company in the matter of stock sales.

The resolution to suspend the license of A. W. Wallace & Company was proposed by the Commission but was stopped by the injunction June 24, 1920, which is now made permanent. It grew out of the sale of Michigan-Colorado Copper Company stock. The Commission had authorized the sale of 975,000 shares, but the Wallace company also disposed of a part of 500,000 shares, which is claimed had been placed with that firm for promotion purposes.

The court opinion ends the original proceedings and forbids the Commission's forcing the company to pay the Michigan-Colorado Company any money for the sale of stock. The Commission may start new proceedings for the revocation of license in case the Wallace firm has sold any stocks not authorized. The court also leaves the way open for the Michigan Colorado Copper Company, or receivers, to sue Wallace for the amounts derived from the sale of stock in controversy. Purchasers of the stock are also left free to sue to recover money paid for these stocks.

Relative to the 500,000 shares of stock, the court says: "The query naturally suggests itself as to why this stock was not placed in escrow as was the remainder of the issue stock. By so requiring the Commission might have prevented any misunderstanding whatever from arising as to the scope of its action."

The court calls attention to the fact that this stock was left free while 975,000 shares were authorized and 1,500,000 shares placed in escrow. It is apparent that the company thought that this extra stock, or proceeds therefrom, could be used for promotion purposes, the court says, intimating that the Commission was lax in not fixing the status of the 500,000 shares.

TALKING A NEW BANK

The Battle Creek News is authority for the report that there is a movement on foot in the food city to establish a fifth bank there.

I. B. A. ANNUAL OCTOBER 31

The tenth annual convention of the Investment Bankers Association of America will be held October 31, Nov. 1 and 2, at the St. Charles Hotel, New Orleans.

ALBERTZART MADE MANAGER

Roy R. Albertzart, who has been with the bond department, the Detroit office of Paine-Webber & Company since 1916, was appointed sales manager, effective May 16.

Business Meets New Conditions

American business has been clearing decks. Budgets have been revised. Every buying, selling and production unit has been overhauled and made ready for intensive service. Economy has been the test—economy of time and effort.

In any study of functions and readjusting of methods, the work done by your bank balance should not be overlooked. Has it been merely a checking account and a basis for commercial credit? Or has it brought to the aid of your organization other constructive services? Are you making use now of all the help it should provide?

Many business men who carry deposits with the Irving or with Irving correspondents have discovered broader service possibilities in their banking connections. The Irving investigates markets as well as credits, expedites deliveries of merchandise as well as collections, supplements the information resources of its customers both in domestic and foreign fields. Every transaction it undertakes, either at home or over-seas, is handled with a clear understanding of business essentials as well as careful attention to banking requirements.

Michigan Bond Items

The Lansing Fuel & Gas Company has applied to the Michigan Public Utilities Commission for an increase in valuation of approximately $600,000. The present valuation is $2,175,000. The company is bonded for $1,653,000 and has outstanding notes of $150,000, according to the figures submitted to the Commission. The first bond issue of $910,000, due April 1, has been extended for ten years at 7 per cent. The second issue of $743,000, due October 1, 1927, and draws 5 per cent. The outstanding capital stock is $700,000, a greater part of which is owned by C. E. Gelst, president. The company wishes to issue more bonds for extensions, and to do so says it must decrease its indebtedness in the form of notes.

The citizens' committee of Alpena has submitted its report to the council as to a filtration plant. It recommends it unanimously. The council has in turn accepted the recommendations of the committee by a unanimous vote. It is probable that a bond issue will be floated to defray the cost.

The city of Buchanan has $200,000 of school bonds for sale. The issue was voted by a majority of 10 to 1.

Halsey, Stuart & Company and the W. C. Compton Company has been awarded the $350,000 of paving and sewer bonds of Lansing at a discount of $13,440. There were several bidders, all being below par.

A. B. C. Hardy Named Manager of the Olds

The General Motors Corporation authorizes the announcement that Edward Ver Linden has been relieved of his duties as general manager of the Olds Motor Works, Lansing, and that A. B. C. Hardy has been appointed acting general manager to succeed him.

THORPE-HAWLEY SALE POSTPONED

Owing to the conflict of the date of the sale of the Thorpe, Hawley & Company assets, heretofore set for May 26, with the convention of the National Confectioners' Association on the same day, at Atlantic City, the Detroit Trust Company, receiver for Thorpe, Hawley & Company, has given notice that the sale will take place Thursday, June 2. An announcement of the sale as originally planned appears on page 40 of this issue.

WEBB, LEE & CO. EXPAND

Offices in Grand Rapids, Jackson, Saginaw and Flint have been opened by Webb, Lee & Company, Detroit, members of the Detroit Stock Exchange and the Chicago Board of Trade. These branch offices are connected with the Detroit office by private leased wire. L. E. Chapple, formerly of the National Union Bank of Jackson, is in charge of the Jackson office, which is the one formerly operated by Allen G. Thurman & Company. Harry H. Williams, formerly of Phipps, Beeson & Williams, will be in charge of the Saginaw office.

GRAND CHEMICAL PRODUCTS CO.

The election of officers of the Grand Chemical Products Company, Grandville, resulted in the selection of John Rowson as president; William E. White, as vice-president, and H. George Nutting as secretary-treasurer. R. A. Caldwell, Grand Rapids; H. Ooro Bera and the officers make up the board of directors. The Chemical company has taken over the French chemical plant and will manufacture spraying materials.

Reserve City Bankers Assn. Meets in Buffalo, June 2-3

The ninth annual convention of the Association of Reserve City Bankers will be held at the Hotel Lafayette, Buffalo, June 2 and 3, according to announcement just issued. The opening session will be held at 10 a. m. and the speakers will be Dr. J. T. Holdsworth, vice-president of the Bank of Pittsburgh, N. A., and Oscar Wells, president of the First National Bank of Birmingham. Dr. Holdsworth's subject will be "Acceptance Syndicate Plan for Financing Exports," while Mr. Wells will discuss present conditions in Cuba.

The annual banquet will be held the evening of June 2, the speakers being John H. Puelicher, vice-president of the Marshall & Ilsley Bank, Milwaukee, and John D. Wells, city editor of the Buffalo Times. Mr. Puelicher's topic is announced as "Dollars vs. Citizens."

There will be two sessions the second day, the speakers at the first being Charles M. Marfield, vice-president of the Seaboard National Bank, New York; David C. Wills, chairman of the board of the Federal Reserve Bank of Cleveland, and J. H. Herzog, vice-president of the National Commercial Bank & Trust Company, Albany, N. Y. Mr. Marfield will discuss commercial letters of credit and repudiation of contract under letters of credit; Mr. Wills, "What is the Federal Reserve?" and Mr. Herzog, "What Change, if Any, Should be Made in the Distribution of Earnings of the Federal Reserve Banks?"

For the afternoon meeting two addresses are scheduled: "Conversion of National Banks into State Banks, and Vice Versa," Joseph H. Kraus, vice-president, Union Trust Company, Cleveland, and "Recent or Contemplated Changes in the Federal Reserve System," Walter W. Head, president Omaha National Bank, Omaha.

VANDER MEULEN MOVES UP

Coincident with the election of Alvah D. Crimmins, of Charlevoix, as cashier of the Grand Rapids National City Bank to succeed Ira B. Dalrymple, Bertram Vander Meulen has been elected assistant cashier.

B. VANDER MEULEN

Mr. Vander Meulen has been with the bank continuously since 1914 except for service in the war, having begun as a clerk in the transit department and advanced through different departments to manager of the same department. He was born in Grand Rapids November 30, 1896, attended the public schools and the Creston Christian school and then obtained a business education at one of the commercial colleges.

IRVING NATIONAL'S NEW SERVICE

With a view to facilitating the business of its correspondents and customers, the Irving National Bank has installed a direct wire service between its New York offices and Chicago, Detroit, Pittsburgh, Cleveland and Buffalo. This service will eliminate delay in transactions involving foreign exchange, securities and other banking operations, and will make it possible to do business without loss of time.

The Detroit terminal is in Room 705, Dime Bank building, and is in charge of Julius B. Wood. William M. Chamberlin, district representative of the Irving, has general supervision over the operation of the Chicago terminal, which is in Room 712 of the New York Life building, 39 South LaSalle street.

Financial Passport to Foreign Credit

Commercial Letters of Credit issued by the National Bank of Commerce in New York not only provide a means of payment but are accepted throughout the world as evidence of financial standing and responsibility.

Through them, our friends share our helpful association with the great banks of foreign countries.

President Alfred Explains the Pere Marquette Report

President Frank A. Alfred authorizes the following statement to correct an erroneous impression in connection with the publication of the annual report of the company for the calendar year 1920:

"Some confusion has arisen in the publication of extracts from the report of the Pere Marquette Railway Company for the fiscal year 1920. This was due largely to the fact that during the first two months of that period the railroads of the United States were operated by the Government. During the remaining ten months they were operated by the corporations. For six months of the latter period nearly all the roads accepted an extension of the standard return of the Government. The Pere Marquette did not do this.

"Its report for the 1920 period contains the corporate results and also the combined returns of corporate and government operation. The latter, as given in the report, do not give a correct idea of the purely corporate results.

"The final outcome was a surplus of $1,393,973 for the corporation. This was derived from the total operating revenues of $35,022,787. Out of that amount were taken operating expenses amounting to $30,350,542, leaving net operating revenues of $4,672,244. Adding non-operating income of $1,761,120 gave a gross income of $6,433,365. Deducting taxes, hire of equipment and rentals amounting to $2,801,100 left a balance applicable to interest of $3,632,265. Interest requirements totaled $2,238,292, which deducted left the surplus of $1,393,973 already mentioned.

"The profit and loss statement as of December 31, 1920, showed a balance brought forward as of December 31, 1919, of $3,985,791. This amount, together with the balance for the 1920 period and other small items, made total credits of $5,534,167 at the end of 1920. From this amount there were deducted $560,000 for dividends on the prior preference stock and other smaller items, which, taken from the total credits, left a credit balance to be carried forward as of December 31, 1920, of $4,825,297.

"The foregoing outline sets forth roughly the position of the company both as to its operations for 1920 and as of the close of that year."

$90,000 OF STOCK OFFERED

The Producers & Consumers' Company, Cheboygan and Detroit, incorporated and recorded with the state securities commission on February 2, 1921, has just received its papers of incorporation for $400,000, which is the capital stock authorized. The paid-in stock amounts to $200,000; stock for sale totals $90,000 and $110,000 is deposited in the county treasury. R. L. Francis, Detroit, is president; S. A. Gain, Cheboygan, vice-president, and John A. Owens, Cheboygan, secretary and treasurer.

FIFTY-FIRST BIRTHDAY

Officials of the Webber State Savings Bank, Portland, had a sign on the door, Tuesday, May 19, which read: "Open House Today. Our Fifty First Birthday." The bank was thronged all day with well-wishers.

APPLICATIONS TO LIST

Applications have been made to the New York Stock Exchange to list the following:

Mariand Oil Company, 954,043 shares common stock, no par; $10,000,000, 8 per cent sinking fund gold coupon bonds, Series A, maturing April 1, 1931.

Steel & Tube Company of America, $10,000,000 general mortgage sinking fund 7 per cent gold bonds, Series C, due January 1, 1951.

The Stock Exchange has admitted to list E. I. du Pont de Nemours & Company $35,000,000, 10-year, 7½ per cent gold bonds, due May 1, 1931, when issued.

ANACONDA COPPER REPORT

The annual report of the Anaconda Copper Mining Company for the year ended December 31, 1920, shows that gross sales totaled $100,296,167, as compared with $100,713,499 in 1919; $147,618,801 in 1918, and $156,205,157 in 1917. After deduction of taxes, interest and depreciation the net surplus available for dividends was $2,691,661, as compared with $5,103,641 in 1919; $20,802,870 in 1918 and $34,333,751 in 1917. There was a deficit of $4,302,089 after taking care of dividends, as compared with a deficit of $4,221,359 in 1919, a balance of $3,318,495 in 1918 and of $14,518,126 in 1917. The net profit and loss surplus at the end of 1920 was $84,753,462 as compared with $62,011,125 in 1919; $66,232,484 in 1918 and $62,913,988 in 1917. Total assets of the company were $294,795,732, or $40,601,098 in excess of the 1919 assets.

P. R. R. REVENUES

During the first quarter of 1921 the Pennsylvania Railroad Company's gross operating revenue totaled $124,594,916, which was $8,727,241 in excess of the revenue for the corresponding period in 1920. Expenses for the period this year amounted to $118,675,112, a decrease of $7,878,931 from the 1920 total.

NIPISSING MINES REPORT

For the calendar year 1920, Nipissing Mines Company, Ltd., reports net income of $1,800,246 after deduction of charges. This is equal to $1.50 a share on the $6,000,000 of capital stock, par value $5, the same as for the preceding year.

THRIFT INSURANCE

Thrift in buying is not measured by the PRICE PAID, but by the VALUE RECEIVED.

It is poor economy to sacrifice VALUE for a saving in PRICE.

Although the Michigan Mutual has saved insurance buyers of Michigan more than a million dollars in premiums, its real claim to YOUR consideration is less in this saving than in the greater VALUE given for the money.

There is a growing recognition of the fact that in compensation insurance financial protection alone is only a part of the real value which every buyer of such insurance has a legitimate right to expect in return for his premium.

The other part—and a most important part—of the value lies in the constructive service which the insurance company may and should perform for its policyholders.

For example, all rates for compensation insurance are based on the number and cost of accidents which have happened in the past. Now it is obvious that if the same number of accidents, at the same expense, continue to occur, these rates can never be lowered. Therefore the single means of radically lowering rates is the prevention of accidents.

Actual experience has proven that more than 70% of industrial accidents are preventable. Only by the prevention of these accidents can the insurance rates be lowered.

Therefore, irrespective of the price charged, the insurance company which gives the greatest assistance in the elimination of these preventable accidents, gives also the greatest VALUE for the premium charged.

For this single purpose—the elimination of preventable industrial accidents—the Michigan Mutual maintains the most extensive and complete organization of any insurance company operating in Michigan, and it is to this service, quite as much as to the great saving in premiums, that our company owes its present position as the largest carrier of compensation insurance in Michigan.

This service, combined with absolute financial security, makes the compensation insurance provided by our company the greatest insurance VALUE offered to insurance buyers of our State.

Let us prove to your own satisfaction that compensation insurance in the Michigan Mutual is not an expense but an investment—that it is truly THRIFT insurance.

Write NOW—today. A postal will do.

Who's Who In Michigan Finance

Archie L. Livingston, Cashier, Charlevoix State Savings Bank, Charlevoix

Archie L. Livingston, for the last eight years assistant cashier of the Charlevoix State Savings Bank, has been elected cashier to succeed A. D. Crimmins, who resigned to accept the cashiership of the Grand Rapids National City Bank, Grand Rapids.

A. L. LIVINGSTON

Not only is the election an honor to Mr. Livingston because of the well-merited promotion of which it is evidence, but because he becomes thereby head of one of northern Michigan's best financial institutions.

Mr. Livingston was born at Mount Pleasant Febrnyr 27, 1890, graduated from high school in that city and later completed a business course at Ferris Institute, after which he accepted a position with the Exchange Savings Bank of Mount Pleasant, spent a year with the American State Bank of Detroit and after that went to Charlevoix on July 1, 1912, as assistant cashier of the Charlevoix State Savings Bank.

The Standard Oil Company of California has declared its first dividend of $1 a share on the new $25 par value stock. This amounts to 4 per cent. or at the rate of 16 per cent a year. In 1920 the regular rate was 10 per cent and 4 per cent extra, on the stock of $100 par value.

The Otis Elevator Company has declared a stock dividend of 50 per cent on the common. The dividend will be in the proportion of a half share on each share of stock held.

The American Brass Company has voted a distribution of $3 a share, payable May 14 to stock of Record April 20, from its accumulated surplus.

The American Smelting & Refining Company has passed the quarterly dividend of 1 per cent on the common stock but has declared the regular quarterly dividend of 1¾ per cent on the preferred stock.

The Timken-Detroit Axle Company has passed the common stock dividend now due, but has declared the regular quarterly dividend on the preferred.

SHATTUCK-ARIZONA

The Shattuck-Arizona Copper Co. for the first quarter of 1921 reports a deficit of $86,112 after taxes and all expenses. In the first quarter of 1920 a surplus of $55,740 was reported after all expenses and reserves for depreciation.

Michigan Wage Readjustments

(*Continued from Page 4*)

developments. A Detroit manufacturer writes: "Our belief is that a further reduction is inevitable. Our men, we are sure, expect this and would register no objection to it. We have postponed doing this for the reason that we feel that general living costs have not been reduced to the point that they should, and until that time comes, the rate we are paying is influenced more by sentiment than by figures that the selling price of our product warrants.

"Right in this connection we might say that we believe that this condition is responsible, to a large extent, for holding back normal business. The raw product that we buy is at the present time selling below pre-war prices and at figures which represent an actual loss to the producer. We in turn fabricate this and sell it at a price that is lower than pre-war prices and lower than our costs. One reason for our product costing us more than we get for it is the price we pay for labor. We feel we have to pay this price for labor on account of the prices that labor has to pay to the retailer for the items that go to make up a bare living. The prices asked by the average Detroit retailer are still very much out of proportion to the prices we manufacturers and wholesalers have set on our goods, and much higher than are being asked in other cities."

An Adrian manufacturing executive writes that he fears his company will have to cut its working force still further in June and July "if our product piles up, as we do not feel safe in accumulating any stocks under present conditions." He says nothing, however, about cutting the pay still further.

A Battle Creek writer makes a like prediction, as does another in Marquette, two or three in Flint, and two in Saginaw. The manager of a Detroit enterprise allied with the paint industry says he hopes additional wage reductions will not be necessary, "although conditions are not looking very bright just now." "We are not planning on further wage reductions at present, but if the cost of living is reduced materially we will no doubt be forced to make another reduction in order to be able to compete successfully with other manufacturers in our line," a furniture maker writes. The chairman of the board of a food producing plant writes that he and his associates are "discussing" the probability of additional wage cuts, although "we are naturally hopeful that no further reductions may be necessary."

Saving America's Dye Industry

(*Continued from Page 6*)

other chemicals needed in the new warfare. How well this country succeeded is indicated by the fact that at the end of the war the United States was producing more gas and war chemicals than Germany, Great Britain and France combined. Is such creative energy and patriotic endeavor to be sacrificed that a former ruthless enemy may continue to profit by her ruthlessness?

It may be asked why a high tariff wall would not be as effective as either the licensing system or the embargo. The nature of the product to be barred provides the answer best. As shown before, there are four fundamental coal tar by-products, benzol, naphthalene, toluol and anthracene, from which are derived thousands of other by-products including any number of dyes and synthetic drugs. It is argued that no tariff wall, no matter how high, would prevent Germany from shipping her coal tar products to this country for the reason that the very nature of the by-products would make it possible for evasion of the tariffs, while, on the other hand, Germany would be perfectly willing to sacrifice profits to almost any degree to put her dyes into American hands.

Coal tar products from bituminous coal are treated with acids or alkalies to bring out the four fundamentals mentioned, after which the

(*No. 8 of a Series of Examples*)

What is the duty of a corporation when stock is presented for transfer by an executor?

It must have record evidence of the will, its admission to probate, the appointment and qualification of the executor and that his appointment is still in force. Specific disposition may have been made of the stock to a beneficiary or trustee, and the transfer must be made in strict accord with such provisions.

"It has been ruled that where a transfer of stock is made by an executor, the corporation is fixed with a knowledge of a will and is chargeable with a knowledge of its contents."

Technical matters regarding transfers of stock are handled by our Transfer Department daily. Our charges are reasonable.

NATIONAL TWIST DRILL & TOOL

four essentials are subjected to numerous other elements, and these in turn can be again subjected to chemical action. The extent to which these reactions can be applied and the number of by-products possible are as yet unknown. It is reported that in one German plant where 11,000 different colors were successfully produced, more than 50,000 by-products were obtained for which it was necessary to find a market.

One American manufacturer who has been experimenting for years was able to get a yield of only 10 per cent on a certain dye process, where he expected at least an 80 per cent yield. Accidentally he discovered that by decreasing the revolutions of the vat paddles from 65 to 60 revolutions a minute he was able to obtain the 85 per cent yield. In other words, a difference in speed of five revolutions of a paddle converted his process from hopeless loss to profit. Such details are not found in books. They must be learned by studious and tireless research. Indigo is an important dye, but if a tariff was put on indigo it would be possible to import indoxyl, an intermediate from which indigo is obtained, by blowing air through it. Mr. Choate said in his address that indoxyl was no more like indigo than he was like a chair, but the simple process of blowing air through it made an important dye. Is is such simple reactions that turn worthless materials into valuable products, and while many of the German secrets are now known in this country through the sale of German patents to the Chemical Foundation, Inc., there are many others to be learned only by research. By the way, it might be mentioned that the valuable German patents sold by the Alien Property Custodian are held by the Chemical Foundation for use of manufacturers, and are not reserved for exclusive use by any present, or future monopoly.

Why Monopoly Is Impossible

The argument that the embargo on German coal tar products would result in unreasonable price advances on American-made dyes and chemicals was answered by Mr. Choate, who said that dye costs in manufacture are negligible. For instance, the dye in the average suit of clothes costs about thirty-two cents, and that used in a fine pair of socks would not amount to more than a cent and three-quarters for each dozen pair. He mentioned also that American textile manufacturers were competing with French and British goods which were colored with domestic dyes.

France has established a license system against German dyes, while Great Britain has declared a ten-year embargo. From France comes the report that German storehouses are packed with dyestuffs, which that country hopes to send into the United States at prices guaranteed to knock out any attempt to develop an American dye industry. Germany must dominate foreign markets, particularly that of the United States, or one of her most lucrative industries will become a liability instead of an asset. In one month recently Germany produced 12,000 tons of dyestuffs, which was an increase of 750 tons over the preceding month. The heavy reparations which Germany must pay is another powerful incentive for the development of a dye market greater than what she enjoyed prior to the war.

Any and every factor tending toward the readjustment and further development of American industry is of importance in the general movement necessary to a return to normalcy. The co-operation of all manufacturers will be necessary to make this forward movement the more rapid and effective. Whether the Michigan manufacturer may or may not be directly interested in the production of dyestuffs, he is affected indirectly by the success or failure of any large industrial activity, especially one as vital as that of coal tar by-product reclamation.

ENGINEERS IN CIVIC AFFAIRS

At the annual convention of the American Association of Engineers, in Buffalo, last week, the delegates outlined a program of constructive work for the 200 chapters throughout the country for the coming year. Featuring the program is a clause calling for more active participation in public affairs, such as assisting local chambers of commerce and the municipal authorities with current problems. The primary purpose of the Association, and which will not be lost sight of in the midst of the other work, is to maintain the ethics of the profession on a high plane. The Association has about 2,000 members in Michigan, the leading chapters being in Detroit, Ann Arbor, Lansing, Grand Rapids and Flint. The state headquarters are in the latter.

B. OF C. OFFICERS MOVE UP

Owing to the resignation of George H. Hannum as president and J. B. Kirby as secretary of the Saginaw Board of Commerce, John Jeffers, second vice-president, is acting as president, and Assistant Secretary Chester M. Howell as secretary.

MUST GUARANTEE THE CAPITAL

The mayor of Detroit has notified John C. Frost, who is backing the Middle States Elevated Company, a concern which wishes to build an elevated railway in Elizabeth street, from Woodward avenue to the Michigan Central terminal, Detroit, that the company must give a guarantee of having enough capital to proceed with construction before the city will consider a grant of operating rights. The mayor said the municipality did not wish to lend itself to any promotion scheme. The elevated company is capitalized at $3,000,000 in an eastern state. Mr. Frost promised, the mayor said, to furnish the guarantee.

W. H. ADAMS' NEW LOCATION

William H. Adams, consulting engineer, and his associates, Luther D. Beckley, civil engineer, and John E. Roth, contracting engineer, have removed their offices from the Vinton building to 2134 Cadillac building. Detroit. Associated also with Mr. Adams is Robert J. Cummins, consulting engineer, Houston, Tex.

A CORRECTION

On page 14 of the May 14 issue of this paper it was incorrectly stated that F. T. Schreiner was secretary-treasurer of the Howell Foundry Company. Claude B. Stowe is secretary-treasurer of the company and Mr. Schreiner is vice-president and general manager.

STAMPING FACILITIES INCREASED

The interest in the Lake Milling, Smelting & Refining Company owned by the Hancock brothers has been purchased by the Seneca Copper Company. This gives the latter immediate facilities for stamping from 1,000 to 1,200 tons of rock daily and increasing its stamping capacity as desired.

GOLDBERG HAS GARDNER AGENCY

The Detroit agency for the Gardner motor car has been given to Harry N. Goldberg by the Westerdale Motor Sales Company, Cleveland, the Michigan distributors. Mr. Goldberg's salesroom is in Davenport street. He was with the Tellotte-Hulek Company formerly.

Unique Tractor Wheel To Be Made in Detroit

A new industry that has decided upon Detroit as a logical location for its headquarters is the Midwestern Tractor Wheel Company, manufacturer of a patented wheel for tractors.

The Midwestern Tractor wheel is provided with adjustable lugs or cleats which can be arranged so that they can be adjusted to any desired depth from nothing to four inches. They can also be set so that they do not operate at all, and the wheel then becomes simply a plain tread tractor wheel, fit to run over any country road or restricted section.

With Midwestern wheels, the tractor owner is thus enabled to regulate the gripping ability of his tractor to meet any soil condition. In addition, a Midwestern equipped tractor can be driven from field to field and over roads prohibited to all but plain tread tractors. Wagons and other machinery can be hauled from place to place, and the utility of the tractor multiplied several times.

The entire operation, adjustment and manipulation of the lugs or cleats on Midwestern wheels is automatically controlled by one lever movement, which can be changed at will, without leaving the seat and while the tractor is in motion.

To date the Midwestern Tractor Wheel Company has not manufactured any wheels for actual sale. The last few months has been given over to experimental work in the refinement of certain mechanical details essential to efficient and profitable quantity production. Arrangements are now being formulated to manufacture the initial order of stock wheels, and official incorporation of the company, under the laws of Michigan, is likewise taking place.

Detroit men are backing the venture and their plans call for a popular subscription to a small block of running treasury stock, after the originators of the business have been given an opportunity to subscribe any reasonable amount. Further information regarding the company's progress will be given from time to time in these columns.

ENGINEERS' JOINT MEETING

Messrs. Clarke and Galusha, of Dwight P. Robinson & Company, New York, were the speakers at Friday's meeting of the Detroit Engineering Society, which was held jointly with the Detroit Section, American Society of Mechanical Engineers, and the Detroit-Ann Arbor Section of the American Institute of Electrical Engineers, at the Detroit Board of Commerce. The subject discussed was "A Mine-Mouth Super Power Station" and referred to the new Colifax plant of the Duquesne Light Company, Pittsburgh.

PURCHASING AGENTS' DINNER

The Purchasing Agents' Association of Detroit at its monthly dinner this week at the Board of Commerce had as the guests of honor a number of manufacturing executives of the city. The principal speaker was A. O. Backert, vice-president and general manager of the Penton Publishing Company, Cleveland, whose subject was "Signs of the Times." Dr. F. A. Perry, of the state coalition committee, discussed "That Long Lost Normalcy." Charles T. Kingston, first vice-president of the association, was the toastmaster. There was a musical program.

GO-CART CAPITAL INCREASE

Stockholders of the Sturgis Steel Go-Cart Company, Sturgis, held their annual meeting this week, and in addition to changing the name of the corporation to Sturgis Go-Cart Company, voted to increase the common stock from $500,000 to $3,000,000. Norval A. Hawkins is president and general manager of the company and Dwight L. Seymour secretary.

For Increased Production

THE TILTED TURRET

A CLEAR TRACK FOR THE STOCK

Will increase your production on bar or chucking work from 10 to 12% over any other make Turret Lathe.

A tool that is made right and is right. We will tool it up complete for your work.

THE WOOD TURRET LATHES are made in any size for handling bar stock from ¾" to 2"

Let us send our representative who will show you its advantages.

Riverside Machinery Depot

251 St. Aubin Ave. **Detroit, Mich.**

(*Continued from Page* 34)

This first article has had entirely to do with the industrial side of this important subject, but there is a national defense side, the importance of which will be realized when it is known that every dye plant can be converted into a high explosive plant in less than three weeks and that a few extra turns of a paddle wheel will turn sulphur black dye into picric acid, a most important element in high explosive shells. Also, if you happen to sport a new green suit, the dye which colors it can be turned into poison gas with a few changes in the process of manufacture and without any addition of machinery or added expense. This phase of the subject will be considered in the next article.

GREEN GOES TO SYRACUSE

Andrew H. Green, Jr., for several years general manager of the Delray works of the Solvay Process Company, has been transferred to the company's general headquarters at Syracuse, N. Y., to be vice-president in charge of operations and engineering. E. M. Bingham, who has been Mr. Green's assistant in Detroit, has gone to Syracuse to occupy a like position. W. C. Shailcross, who has been manager of the caustic soda department at Delray, succeeds Mr. Green as local manager.

FARM POWER MEN ORGANIZE

The Michigan Farm Power Machinery Club has been organized in Lansing by managers of various tractor and implement companies in the state to maintain and conduct exhibits, demonstrations and generally aid in improving business. Frank E. Miller, manager of the Lansing agency of the J. I. Case Threshing Machine Company, has been elected president, and Albert E. Burd, manager of the John Deere Plow Company's local office, secretary treasurer

New Publications

CUTLER-HAMMER BOOKLET

"The Cutler-Hammer System—Safest in the World," is a title of a sixteen-page, 8½ by 11 booklet with a two-color cover, recently published by the Cutler-Hammer Mfg. Co., Milwaukee and New York. The booklet illustrates and explains the new line of control apparatus which has recently been developed by this firm for use with high speed newspaper presses.

The booklet also takes up briefly the C-H Dispatch Conveyor for conveying folded papers from the press to the mailing room; the Electric News Bulletin which gives a simultaneous announcement of news in a bulletin form at one or several different points under control of a keyboard at some central location; the C-H automatic paper splicing machine, which splices news printing paper without marring the printed sheet; the Type H drive for paper calanders, electric linotypes and monotype pots and heating equipment for matrix beds.

THE GOLDEN YEAR OF GOODRICH

The B. F. Goodrich Rubber Company, Akron, which originally was incorporated under the name of Goodrich, Tew & Company, on December 31, 1870, and which celebrated its fiftieth anniversary at the end of last year, has issued an illustrated booklet entitled "The Golden Year of Goodrich," which, in addition to giving a complete history of the house of Goodrich is a history of the rubber industry as a whole. There are four symbolic illustrations in color, representing Earth, Air, Fire and Water, which were specially painted by W. T. Benda, while the story was prepared by Willard D. Nesbit. A fact not generally known is brought out in the book—that Alanson Work, father of the present chief executive of the company, became superintendent of the plant in 1879.

ATLAS DROP FORGE ELECTION

The Atlas Drop Forge Company, Lansing, made several changes in its executive staff and directorate at its annual meeting, last week. Samuel H. Carpenter, secretary, was chosen president and general manager. His place was filled by J. P. Hopkins, who also continues as vice-president. Earl W. Goodnow was elected to the board and will become assistant secretary. The directors are R. E. Olds, R. H. Scott, S. H. Carpenter, J. P. Hopkins, R. Bruce McPherson, H. A. Haze and Earl W. Goodnow. The treasurer is Bertha L. White.

Attention was directed to the fact that a ten per cent cash dividend was declared April 12. The company is now operating on a 50 per cent production basis, with 140 employed. It is expected production will begin to gain by early September. The company has just installed a heat treating plant.

NOW IN FULL OPERATION

The United Engine Company, Lansing, passed its low ebb in January and is now back on a 100 per cent production basis, according to Charles L. Sprinkle, president and manager. The full force is working on full time. Foreign business is improving rapidly, with orders from Canada, Australia, New Zealand and South America approaching normal.

RATIGAN JOINS HANNAN

William A. Ratigan, for some time sales and advertising manager for the Braun Lumber Company, Detroit, has resigned to become manager of the improved property department of the Hannan Real Estate Exchange, with offices in the McGraw building, Detroit.

What's Back of the Paint You Buy?

Quality in paint is something you cannot see—you must trust to the reputation and integrity of the manufacturer whose name is back of the product—and the service records of the paint.

If you buy ***Sta-White***—the pure white oil paint for walls and ceilings you have double assurance of service and satisfaction. Its service records in every type of industrial plant over a long period of years are proof of its high quality and durability. It is backed by the reputation of the Detroit Graphite Company as makers of good paint for thirty years.

There are cheaper mill white paints than ***Sta-White,*** but none with greater durability or lower ultimate cost.

Sta-White has established a recognized reputation for leadership in the mill white field. It is one of the dependable line of ***Degraco Paints*** and can be used without the hazard of experiment.

Write for sample panel and copy of our book "Lighting Industrial Interiors."

MICHIGAN AND FINANCIAL RECORD

Making the Railroads a Closed Shop

What Principles Laid Down by Labor Board Mean; What the Manufacturers' Associations Intend to Do

By F. W. HERSEY

ONE of the greatest struggles between organized labor and the industrial and transportation interests ever witnessed in this country is impending. Upon its outcome will depend to considerable extent the much desired return to the much discussed "normalcy."

Industrial management has taken the stand that transportation costs must be lowered considerably before manufacturing can be resumed upon a basis conforming to the new economic conditions; that the price of labor used in mill and factory has been or will be reduced, but the cost of materials for fabrication and the cost of distribution of the finished product cannot be appreciably lowered under existing freight rates.

Railroad management has taken the stand that present high freight rates are the result largely of increased labor costs and uneconomic working conditions forced upon the railroads by unionism supported and encouraged by the former Administration.

Financial management has taken the stand that until all costs have been materially lowered the credit of the country will continue to be strained to the point where restrictive measures will remain necessary.

Deflation has been in progress for some time, but the depression in business still is with us and will be, according to all evidences, for the rest of the summer and well into the fall. If we emerge from this sub-normal condition next winter it will be because deflation has been successfully accomplished in freight rates as well as in every other item on the economic list.

The Hearing in Chicago

The Railroad Labor Board has been conducting a hearing in Chicago to ascertain if a reduction in wages can and should be made. The committee on interstate commerce of the United States Senate has been trying to find out why the railroads have not been able to make ends meet even under the existing freight and passenger rates. At both hearings the railroad managements have declared that while the present wage and working conditions exist they will not be able to lower passenger or freight rates, but on the other hand will have to ask for further increases.

Representatives of the railroad brotherhoods have replied that the reason for high rates is not wages or working conditions, but extravagance and mismanagement; that in the operation of the railroads management has neglected to adopt more modern and efficient machinery and equipment.

While these hearings have been in progress the National Association of Manufacturers has held its annual meeting and gone on record as being in agreement with the railroads that high wages and uneconomic working conditions are largely responsible for present freight rates, and that these conditions must be remedied. The Association is opposed to the Railroad Labor Board as it is organized and is determined to ask for its removal on the ground that it does not represent public interest, but is dominated by organized labor. The idea of a national railroad labor board is not disproved, but the Association believes it should be organized as a judicial body, composed of men of judicial mind representing the public, rather than of members drawn from the employer and employe classes and the general public.

Michigan Manufacturers' Resolutions

The attitude of the manufacturers may be gauged by the following resolutions adopted by the Michigan Manufacturers' Association at the annual convention in Detroit recently:

"WHEREAS the Railway Labor Board has been conducting a hearing in Chicago during the past month or more, with a view of determining whether railroad wages shall be reduced; and

"WHEREAS said Board has served notice upon the carriers and also upon railroad labor, organized and unorganized, that the agreements that were entered into by the United States Railroad Administration with labor of various classes are cancelled, and that new agreements must be negotiated prior to July 1, which plan if followed out will have the effect of cancelling all railroad labor throughout the country into a closed shop, and

"WHEREAS an investigation is now being conducted by U. S. Congress through Senator Cummins, of Iowa, having for its object the development of the facts relating to the railroad situation as it exists today.

"IT IS HEREBY RESOLVED that the directors of this Association be instructed to utilize its forces and energies toward bringing this matter to the attention of the farmers, the merchants, the manufacturers and the public generally throughout the country in an endeavor to prevent the unionizing of employes engaged in the conduct of handling the transportation of the country, and

"WHEREAS in the judgment of this body the present high freight rates and industrial depression now upon us as a result of the war, cannot be relieved except through a return to normal conditions which involve the lowering of wages paid on railroads, along with decreases in all other classes of industry, and the abolishment of the onerous working conditions that were forced upon the railroads during the government control period, and the return of the power to the management of railroads to operate the properties without undue interference on the part of the labor unions.

"THEREFORE BE IT FURTHER RESOLVED that a committee consisting of three be appointed to take any action that may be necessary for the purpose of presenting the views of this Association to the Congressional Committee and to any other public body or officer which may have the subject matter under advisement."

It will be noticed that this resolution does not follow the spirit of the American Plan, the subscribers to which are not opposed to labor organization, but to interference by labor organizations and labor leaders in the conduct of industry. The Michigan Manufacturers' Association has gone further and registered opposition to the "unionizing of employes engaged in the conduct of the handling of the transportation of the country." This is the attitude of the National Association of Manufacturers, and of state associations affiliated with the national body. This is nothing short of presenting a united front against the existing railroad brotherhoods with a membership of 2,000,000 and assets of more than $40,000,000.

John L. Lovett, manager of the Michigan Manufacturers' Association, sent to all its members a folder explaining the railroad wage and rate situation and asking each one to take an active interest in the fight about to be made. The reasons for the opposition to the present National Railroad Labor Board as organized may be summarized as follows:

Although its decision of July 20, 1920, granting wage increases retroactive to May 1, 1920, to all railroad employes was cancelled April 14, 1921, because even the Board found many of them unreasonable, unjust and therefore burdensome, the Board requires that railroad employers and employees shall make new rules and agreements acceptable to both, if such is possible. Thus the burden of setting up rules and regulations to govern wages and working conditions on the rail transportation system of the country in the future is placed upon the carriers and their employes, with the understanding that an agreement shall have been reached by July 1. The Board reserved the right to continue the existing rules and working conditions beyond July 1 if there seemed to be undue and unjustifiable delay in making these agreements. Should the parties concerned fail to reach an agreement the Board will promulgate such rules and regulations as it deems reasonable and make them retroactive to July 1.

Unionization Guaranteed

The kind of "agreements" the Board would be likely to put into force may be judged by the following sixteen principles set up by it as a basis for these rules and regulations:

1. An obligation rests upon the management, upon each organization of employes and upon each employe to render honest, efficient and economical service to the carrier serving the public.

2. The spirit of co-operation between management and employes being essential to efficient operation, both parties will so conduct themselves as to promote this spirit.

3. Management assuming the responsibility for safe, efficient and economical operation, the rules will not be subversive of necessary discipline.

4. The right of railway employes to organize for lawful objects shall not be denied, interfered with or obstructed.

5. The right of each lawful organization to act toward lawful objects through representatives of its own choice, whether employes of a particular carrier or otherwise, shall be agreed to by the management.

6. No discrimination shall be practiced by management as between members and nonmembers of organizations or as between members of different organizations, nor shall members of organizations discriminate against nonmembers or use other methods than lawful persuasion to secure their membership. Espionage by carriers on the legitimate activities of labor organizations or by labor organizations on the legitimate activities of carriers shall not be practiced.

7. The right of employes to be consulted prior to a decision of management adversely

Digitized by Google

affecting their wages or working conditions shall be agreed to by the management. This right or participation shall be deemed adequately complied with if and when the representatives of a majority of the employes of each of the several classes directly affected shall have conferred with the management.

8. No employe shall be disciplined without a fair hearing by a designated officer of the carrier. Suspension in proper cases pending a hearing, which shall be prompt, shall not be deemed a violation of this rule. After a reasonable time prior to the hearing he is entitled to be apprised of the precise charge against him. He shall have reasonable opportunity to secure the presence of witnesses and shall have the right to be there represented by counsel or other adviser, if the judgment shall be in his favor, he shall be compensated for the wage loss, if any, suffered by him.

"Proper" Classification Provided

9. Proper classification of employes and a reasonable definition of the work to be done by each class for which just and reasonable wages are to be paid is necessary, but shall not unduly impose unnecessary requirements upon the carrier.

10. Regularity of hours or days during which the employe is to serve or hold himself in readiness to serve is desirable.

11. The principle of seniority long applied to the railroad service is sound and should be adhered to. It should be applied in such a way as to cause undue impairment of service.

12. The board approves the principle of the eight-hour day, but believes it should be limited to work requiring practically continuous application during eight consecutive hours. The hours' pay, eight hours' work should be performed by all railroad shop employes and road and train service employes regulated by the Adamson Act who are paid generally on a mileage basis as well as on an hourly basis.

13. The health and safety of employes should be reasonably protected.

14. The carriers and the several crafts and classes of railroad employes have a common interest in the competency of apprentices or persons under training. The number of any craft or occupation shall not be unduly restricted.

15. The majority of any craft or class of employes shall have the right to determine what organization shall represent such craft or class. Such organizations shall have the right to make an agreement which shall apply to all employes in such craft or class. No such agreement shall infringe the rights upon the right of employes not members of the organization representing the majority to present grievances either to the carriers or representatives of their own choice.

16. Employes called or required to report for work and reporting, but not used, shall be paid reasonable compensation therefor.

What Lovett's Analysis Shows

Mr. Lovett's analysis of these principles shows the following three outstanding facts:

1. The organization of railroad employes is recognized and encouraged.

2. A majority of employes in any craft or class has the right to determine what organization shall represent the members. A majority has the right to make an agreement to apply to all employes in such craft or class. While it is specifically stated that no agreement shall infringe upon the right of an employe not a member of the organization representing the majority, to present grievances either to the carriers or by representatives of his own choice, yet the minority must work under the agreement determined upon by the majority. Such a nonunion employe is bound by union rules.

3. Complying with these decisions means the unionizing of all railroad employes in every department. The railroad is to become a closed shop.

Prior to government control of railroads the carriers had agreements with approximately 35 per cent of their employes. Now, however, the Railroad Labor Board desires to force the railroads into agreements with twenty classes of labor organizations, which agreements must be consummated before July 1. The railroads must recognize new unions that were developed during the period of government operation, and which cover every branch of service from water boys and apprentices to clerks and even subordinate officers. Such a ruling plays directly into the hands of labor leaders who are determined to force the closed shop upon not only the transportation system but the whole industrial organization of this country.

No longer would the railroads have any right to select their own employes, establish wages and working conditions in accordance with the conditions under which they are operating, and with due consideration for the many other details and expenses of railroad administration, unless one great union approved their judgment. We say one great union because the railroad brotherhoods are to all intents and purposes one great union, and inasmuch as a successful attack upon any one unit, whether operating under a different name and independent constitution and by laws, would weaken the whole structure of organized transportation workers. Therefore, we must consider the railroad brotherhoods as one unit in the final analysis.

Why the national agreements recently abrogated worked a hardship is shown in a few illustrative cases presented by Julius Kruttschnitt, chairman of the board of directors of the Southern Pacific Railroad, at the Senate hearing in Washington. He gave only ten but said they could be multiplied indefinitely.

Four hostlers at Ogden, Utah, whose rates were paid back pay amounting to $9,364 because their titles had been changed by the decision of the Director General, although neither the character nor the volume of their work was changed.

A car repairer on a Virginia railroad, who was laid off because there was no work, was re-employed where there was work, and under the seniority ruling he received $1,000 in back pay for work he never did.

One clerical agreement provided that when employes were required to check in or out on their own time they should be paid for one hour extra per day per week, no matter how few hours they worked. During the first six months of 1920 this ruling cost the railroads $6,500,000, or at the rate of $13,000,000 a year.

When the fixed minimum hourly rate for car repairers was put into force on the Chesapeake & Ohio who were working on piece work the efficiency decreased 41.4 per cent and for air brake repairers it decreased 33.4 per cent.

Addition of piece work in the wheel shops of the Union Pacific at Omaha increased the time required for a job 31.9 per cent and decreased the output 24 per cent. In the coach cleaning yard at Denver the output decreased 38.8 per cent and the production decreased 28 per cent.

An employe in the Southern Pacific shops at Tucson, Ariz., was paid $5.60 for three days' work because he was sent 214 miles to repair a gas engine, 45 1-2 hours being punitive overtime spent in travel or waiting. As a result of several such instances he was allowed only 377 1-2 hours in a 23-day working month, earning $272.16. A pipe fitter from the same shop was allowed 393 hours in a 23-day month, earning $281.52, most of which was punitive and double time allowed while traveling in addition to expenses.

In the yards of the Southern Pacific a gang of men is employed to place blue flag signals and couple and uncouple air brake hose on trains. When any member of this gang were absent it was customary to put car cleaners on their jobs. The Director General changed the classification of the substitutes from watchmen with laborers' pay to car men and allowed them back pay amounting to $14,436 distributed among fifteen unskilled men.

On the same system stationary engine watchmen were changed to electrical workers by reclassification, although they knew nothing about electricity or electrical equipment, with the result that one man on the Salt Lake division received back pay of $2,381; another, $2,094; another, $2,009; another, $2,003, and six others, from $1,500 to $1,900 each.

Existing Shop Craft rules require in changing the nozzle tip on the front end of a loco motive that a boiler maker and his helper be called in to open a door, that being boiler maker's work; a pipeman and helper to remove the blower pipe, that being pipeman's work; a machinist and helper to remove the tip, that being a machinist's work. The same gang is required to put on the new nozzle tip.

The simple process of coupling or uncoupling air hose between cars earns a man, under union rules, 80 cents an hour, time and a half for Sundays and holidays, or $215 a month for a day of seven hours and forty minutes

Why Discriminate?

These advantageous working and wage conditions were obtained from the government during the period of the greatest emergency by organized labor and they were in force when the railroads were returned to their owners. Since that time the brotherhoods have worked diligently to keep these agreements in force. Finally they were cancelled, but the manufacturers as well as the railroad owners contend that so long as the labor organizations dominate the Labor Board any new agreements made will be equally as burden some. They also ask why they should not be allowed to make their own agreements with labor without interference by a third party, as is the case in all other industries.

Whether or not the contention of the railroads that wages are largely responsible for the increased freight and passenger rates may be decided after a perusal of Mr. Kruttschnitt's analysis on wage increases since 1917. Labor costs are in two classes, direct and indirect. Direct labor cost is the compensation paid employes; indirect costs are the labor charge against materials bought by the railroads. The table shows the upward movement.

Year	Wages	Increase over Previous Year
1917 (before Adamson Law)	$1,468,576,294	.....
1917 (after Adamson Law)	1,739,482,142	$270,905,748
1918	2,013,313,351	274,331,209
1919	2,343,138,481	329,825,091
1920 (Labor Board Grants)	2,690,316,251	$35,087,919

The labor costs of switching and terminal companies are not included in these figures for the reason that they are not available for years prior to 1919. Since 1916 the aggregate increases, exclusive of switching and terminal costs, have been $2,229,639,957. Since 1917, the last year of private management and the beginning of federal control, the increases have amounted to $1,868,734,209. For 1920 the labor costs, including those of switching and terminals companies, were $3,742,486,936. Thus the labor costs to first class carriers were greater in 1920 than in 1917 by more than 115 per cent, while during the same period the gross revenue of the carriers was increased less than 40 per cent. Additional railroad labor costs were due entirely to government action.

The theory of organized labor was that the railroads should pass the increased costs of labor on to the users of the railroads, which was done at the most critical period in the country's history, and at a time when the demand was for decreased costs to encourage a resumption of business confidence, credit and production. Wage increases pending when the Government turned back the railroads were passed on to the Railroad Labor Board to grant or deny.

Figures on Operating Costs

Mr. Kruttschnitt's figures on the operating revenues are as follows:

1920	$6,325,462,742
1919	5,184,064,321
Increase	$1,041,238,541
Railway operating expenses, taxes and rents were:	
1920	$6,163,128,341
1919	4,667,774,131
Increase	$1,495,264,210

After making allowances in each year for railway tax accruals, uncollectible railway revenues, equipment rents and joint facility rents, the net railway operating income was for

1920	$ 62,864,471
1919	$1,6,290,090
Decrease	$454,025,619

Studebaker and Its Men

The First Detailed Story About a Successful Co-Operative Plan Affecting 20,000 Employes

At the left is shown a group of Studebaker Corporation employes assembled to receive their anniversary checks, which came due during the week previous to the date of this meeting. The group shown in this picture is somewhat smaller than the average, and is of employes working in the South Bend plants. At the right is a street view in "Studebaker Place." Final cleaning-up has been done since this photograph was taken.

AT THE RISK of seeming redundant, let us go hurriedly over a story which is familiar to every individual who has kept even remotely in touch with the industrial situation in this country during the last half decade.

The time of this story is so close that it seems only yesterday; and it is a story about markets. Markets, markets—they were everywhere, with buyers vying with each other in their cries for early deliveries. Sales organizations were finding themselves facing a new situation; and deep in the solution of a new and somewhat puzzling problem. It was no longer a problem of selling; rather, it was how to keep the sales ledger from getting too far in advance of the most optimistic production schedule.

And in the face of all this, seemingly to make the matter more complicated, it was discovered that the labor supply was sorely inadequate to meet the demands of forced production. Despite the fact that the unskilled citizen had joined the ranks of the worker to assist in coping with the emergency, it was found that the demand was yet far in excess of the supply. Workers evinced a tendency to go from place to place as employers were forced to competitive bidding in connection with wages. No concern could be sure of its employes in view of the fact that a more attractive field was likely to offer at any time.

The question of labor turnover, although it had always demanded more or less consideration as a continual menace, suddenly took the field in full armor and loomed up as the markets called forth more and more production. The markets became more insistent and production was goaded to its utmost. Labor reached a premium and was never more uncertain. Employers, awake to the situation, suddenly discovered that their labor turnover was increasing in that mathematical ratio which has to do with doubling the amount at each turn. Briefly, it was time for immediate action.

The term "Industrial Relations" was given a new prominence almost over night, with new

By JAMES R. ADAMS

Editor the Studebaker Co-Operator

plans and schemes being announced right and left. Systems of co-operation, intended to work for a better understanding between employer and employe, sprang into being. A number of these systems served, at least to a certain degree, the purpose for which they were intended, while others were more or less unsuccessful.

Conditions have changed. Today, business must again be conducted on the old basis, with the sales organization functioning as of old. Production with most concerns it no longer at a premium, while labor, with the usual Monday morning crowd once more at the employment window, can hardly be thought of as the cause of competition among employers. But—

Now that the emergency seems to be past, temporarily at least, are we going to do away with the schemes of co-operation which were successfully employed when the need was urgent?

Various employers doubtless will answer the question in the light of their individual circumstances. The Studebaker Corporation of America, employing on an average about 20,000 workers in the building of automobiles, answers the query in the negative and suits its action to its word by continuing its unique and complete co-operative plans as put into operation in its plants at South Bend, Ind.; Detroit, Mich.; Walkerville, Canada, and all branches, during the summer of 1919.

The Studebaker Plan

This system of co-operation, which has been operated so successfully that it has been deemed worthy of a year of trial under more normal conditions, is based upon the granting of certain benefits and privileges to the employes in exchange for prompt attendance, loyal application to duty and continuous service. It is a direct attack on the problem of labor turnover, and the employes are so informed plainly. It does not savor of paternalism nor purport to give something for nothing. In fact, it is simply a business agreement between the Studebaker Corporation and its employes, wherein the party of the first part agrees to give certain benefits and privileges to the party of the second part in consideration of continuity of service and loyal application to duty.

The first consideration in the transaction is necessarily an obligation of the employe, as the system fails to function without his first carrying out his part of the contract. As is definitely stated in the booklet copy of the plans furnished each employe in the language with which he or she is most familiar, the fundamental obligation of the employe is to stay on the job in good faith from day to day, and any absence on his or her part, for any reason whatsoever, for more than thirty days during the year serves automatically to forfeit the right of the employe to participation. Absence without leave for more than six full working days during the year works likewise.

The management interprets this restrictive clause somewhat liberally, and while it is the intention to stick to the letter of the agreement, certain circumstances and conditions occasionally are taken into consideration in passing upon an employe's eligibility to participation. But in no case is any wilful violaton on the part of an employe given countenance where he or she has not met the attendance requirements.

Probably the feature which has attracted widest attention among the employes, and among persons outside the organization who have shown an interest in the trial of the system, is the one which makes it possible for employes in good standing to purchase the company's stock under extremely liberal provisions. This feature is, of course, based on the assumption that a man shows greater pride and concern in the manipulation of any business in which he has a financial interest. It provides that an employe who has been with the company in good standing for three months or longer may purchase the stock, with a maximum annual purchase of $300, market value. Ten per cent of the purchase price is payable at the time of sale and 40 per

Digitized by Google

cent in equal quarterly payments over a period of four years. The remaining 50 per cent is paid by the Corporation over the same period in exchange for loyal and continuous service. At the end of four years the stock is delivered to the employe in his own name.

For the Employe Who Leaves

Interest at the rate of 6 per cent is charged the employe on the unpaid balance. All cash dividends and stock dividends paid on the common stock are credited to the accounts of the employe, and the excess of dividend credits over interest charges acts as a reduction in the amount of final payment to be made during the last year by the employe. Counting the present dividends to be standard, an employe who bought under this provision during the first three months of 1921, when the market value was between $60 and $70 a share, will at the end of his four years actually be out less than $10 for a share with a par value of $100.

As participation under this provision is entirely voluntary, the employe may withdraw from under it at any time. If he withdraws before he has been a participant six months, he will get back in credits only what he himself has paid in. If he withdraws after having participated six months or longer, he may either buy up the unpaid balance and receive the stock in his own name or authorize the company to dispose of it for him at the prevailing market price—in which case he will benefit by any increase in the market value at the time of sale over the price of ten when he purchase. Employes leaving the company for any reason have no alternative but to dispose of their stock holdings under this provision in one of the two specified ways.

That the employes are quick to take advantage of this proposition is attested by the fact that approximately 28 per cent of the total number now own the maximum amount of stock under this provision. There has been little effort on the part of the company to further sales of this sort among employes, the majority of sales having been made at the suggestion of the purchaser.

To anyone going thoroughly into the working of this provision it will be evident that there is nothing to prevent an employe from taking advantage of any sudden rise in the market value later by selling his holdings six months or longer to dispose of his holdings at a profit. But it has developed that a man who goes into the proposition is usually furnished enough to see that any such action on his part is nothing less than sacrificing a greater gain in the future for a little money at present. Then, too, while there is no such inference on the part of the company, the majority of the employes participating under this provision seem to feel that they are under a sort of moral obligation to keep the stock acquired in this manner as long as they are in the company's employ. There are, of course, some exceptions.

It is impossible to give any concrete results of the working of this particular provision to date, but the general effect is such that the management has expressed a desire to see each employe a partner.

The Anniversary Check Provision

Another feature which has been employed at great cost, and which has met with the heartiest approval of the employes, is the anniversary check provision. This feature, which while in a revision of the company's old bonus system, provides for the payment of anniversary checks to employes for a year of uninterrupted service, as defined in the paragraphs dealing with the obligation of the employe.

On the occasion of his first anniversary date an employe in good standing receives a check from the company equal in amount to 5 per cent of his earnings during the last year. The percentage which determines the amount of the check does not vary on the first four years

DR. C. A. LIPPINCOTT

of service, but on the fifth year it doubles, making the check equal in amount to 10 per cent of the annual earnings. It remains the same for all succeeding years. This provision, as is the case with all provisions of the system where there is a service period involved, is retroactive, giving all old employes in good standing the privilege of taking advantage of the larger percentage.

A meeting is held once a week for those employes whose anniversary checks have come due during the week previous. The manager of the Co-Operative Department makes a brief talk to the assembled employes in which he makes it clear that the checks about to be given out are not donations in any sense of the word—that the company can well afford to give such a check to the man who stays on the job in good faith. He also goes on to explain labor turnover and its cost to the company. The anniversary check provision in 1920 cost the company approximately $800,000, as 8,063 employes shared.

While it is known as the life insurance provision states that at the death of an employe who has been continuously with the company for five years or longer a check for $500 will be given to his or her family. During the last year a number of checks were paid out in this manner.

Employes who have been continuously with the company for twenty years or longer, and who have reached 60 years of age, are eligible to retire on a pension equal to 25 per cent of their average annual earnings for the five years immediately preceding the date of retirement, provided this average annual earning is less than $3,000. A minimum pension of $30 a month is provided for in connection with this feature.

This being retroactive, a number of the company's old employes are in a position to accept the privilege. Approximately 50 of them come regularly for their monthly check. It is, as a precautionary measure, a part of the agreement that no employe sharing under this provision may work for another concern or receive payment on any other payroll of the company while on the pension list, without the special consent of the company.

Studebaker also grants vacations with pay to its employes under a provision of the co-operative work. Factory employes are entitled to this vacation at the completion of their second continuous year of service. A vacation becomes due on the anniversary date, but must be taken at a time satisfactory to the foreman. When a man contemplates taking his vacation he takes the matter up personally with the foreman and the two of them arrange the matter so the absence of the employe will not interfere with the regular working schedule of the department.

This provision, with 3,541 participants, cost the company approximately $132,000 in 1920. While it is impossible to check the returns in connection with this expenditure, it is felt that the money is well spent inasmuch as numerous participants have expressed themselves as feeling morally obligated to make this expense up to the company through faithful and conscientious endeavor throughout the remainder of the year.

Aside from all this, the company has spent in excess of $2,000,000 in the building of artistic and thoroughly practical homes for its employes at the South Bend plants. The city of South Bend is no exception to the general condition in that it has been confronted during the last few years with a sharp housing shortage. When the company opened its new automobile plant in the city during the latter part of 1919 it became evident that it would be impossible to find suitable homes for the workmen who had to be housed in it. What homes were available were not suitable for the class of workmen, mostly skilled mechanics, who needed homes. The company executives had previously decided that a man to be at his best must be properly housed in a suitable neighborhood. So to combat this situation, the Citizens' Realty Company, financed by Studebaker capital, was organized in December, 1919, for the purpose of erecting suitable homes for Studebaker employes.

A tract of land was obtained on the outskirts of the city and named "Studebaker Place." Work on the development was started early in 1920. The company made use of its large buying power in getting materials and placing contracts, and informed the employes from the very beginning that the homes were to be financed on easy payments at cost.

It was the original intention to erect 1,500 houses and at the time of this writing more than 250 have been completed. Architects and landscape engineers who have watched the progress of the work have unanimously pronounced it the most complete as to detail of any similar undertaking they ever witnessed. Every utility possible to make the addition strictly modern has been employed. Improved streets, gas, electricity and other desired utilities are in use as well as storm and sanitary sewers, concrete curbs, gutters and wide sidewalks have been put in. City water and gas mains have been installed and are sufficient to care for any growth which the addition may experience.

How Homes Are Sold

Five distinct types of houses have been used in the construction. The division exteriors have, for the sake of diversity, been given different treatments to do away with any semblance of monotony. The streets are laid out in graceful curves, conforming to the general tendency in the architecture. Lots have been laid out with the idea of a garden plot in the rear and are roomy on the sides. No expense has been spared to make the homes the very latest thing in construction and design.

Under the co-operative plan which affects the sale of these homes to employes, the first allotment of 200 is being offered with an initial payment of 2½ per cent of the purchase price, with the balance payable in monthly payments equal to one-half of 1 per cent of the purchase price. This is understood to be in the nature of a lease extending over five years, with all payments during that period given as an evidence of good faith on the part of the employe. A sum equal to one-twelfth of the annual charge for taxes and insurance is also payable monthly. The lease is based on the theory that the tenant will become the ultimate owner of the property and it is expected that he will keep the property in a good state of repair.

If the tenant remains continuously with the company in good standing for five years he

Punch and Power Press Operation

These Machines Are Very Simple in Principle But Perform Operations From the Smallest to Largest

By JOHN J. RALPH

THE essential definition of the power press is simple—just a ram moved by power, means to guide it in a fixed direction and return it to the starting place, and a solid base to receive the pressure. The base usually is joined to the ram by the guides.

They vary more than human beings; in fact the uninitiated would not feel that all were really members of the same family. There is the little hand paper punch you can put in your pocket, and the giant forging press that takes an ingot of steel, squeezes it, forms it and reduces it in size with the greatest of ease.

Power presses are an ancient proposition. Archimedes invented the screw. He used it to draw up water but it was not long before the old Greeks found that it was a most powerful mechanical element. Then there were lever presses for one purpose or another.

Of course nothing but hand or animal power was used until a short time ago. Boulton, of England, about 1770, has the credit of making the first power-driven press. He used a vacuum as the working force. A while later and the old blacksmith power hammer, operated by water power, developed into the gigator shear. The steam engine was inverted. They drove the fly-wheel by, power, put tools on the end of the cross-head, lowered the cylinder to an anvil—and the crank press was born.

About 1660 Pascal played with water and made a most peculiar discovery. If he took a closed tank of it and then pressed on a little piston he got the same pressure per square inch all over the tank. This on a big surface meant a great total pressure. By making such a surface movable he found that he could make one pound move 99 pounds when the big piston had a hundred times the area of the little one. He found also that he had to force the little piston a hundred times as far as the big one moved. This was the origin of our hydraulic press, the first practical one being built by Brahm in 1796.

By about 1835 we had developed all of the fundamental types, except perhaps the knuckle-joint type. By 1870 this last had been developed so that it was without a superior for fine, exact work, and was in fairly general use in the mints of the foremost countries of the world. Our own power press industry dates from about 1850.

Where does the power press touch us? Perhaps it might be better to ask where it does not touch us. That alarm clock that woke us up this morning is almost entirely a product of it. Parts of the bed we slept in were produced by it. The can or tube that holds the tooth paste, the eyelets in our shoes and so on ad infinitum throughout the day—practically everything we use has been produced wholly or in part by the power press and the tools which have been made to fit it.

It is rarely that the average man sees the finest finished products of the other machine tools. Put your hand in your pocket and pull out your change. Every coin in it is a perfectly good sales argument for the power press. So is the fork and spoon you use at breakfast. That tobacco can with its embossed letters is the product of a most highly developed press with triple action, automatic feed, and has about all of the refinements there are in presses.

The power press has made the inexpensive automobile possible. The breech-loading gun exists only because of its cartridge, and this is a product of the punch press. The price of instruments of precision, such as timepieces, cameras, typewriters and cash registers, would be entirely beyond the range of any but the wealthiest were it not for the press and its tools.

Almost every line of industry uses these machines. The book-binder would be lost without them. They have invaded the wood-working field and are used in making veneered work. In times past the printer used only a straight screw press. Today his machinery has departed from these lines but fine pictures are still printed by their means. The doctor's prescription is filled with power press-made pills. The electrical insulator and many other similar clay pieces are made on it.

Power presses may be roughly divided into two kinds—the individual operation machine, which is merely a method of applying enormous forces that cannot be applied in other ways; and the manufacturing machine, which uses special tools to do special jobs and turns out duplicate work in large quantities.

In the first class would be included the hydraulic forging presses, the shears, punches of various types, and wheel presses. The press for manufacturing purposes in some instances is precisely the same machine as the other but is tooled up differently.

In its larger sizes the non-manufacturing machine is very impressive. The big forging press stands high up in the air so that the mere man who operates it seems entirely insignificant. Enormous cranes carry the material to it and away from it. There is heavy machinery to handle the ingot being worked on. To see one of these at work, especially at night, is to carry away a picture that will never be forgotten, but to most it is of interest merely as a spectacle. There is little opportunity of our needing one in our factory.

The punch and shear also comes properly in this individual operation machine classification. These, especially in the small sizes, are very common and are made in a very great variety of shapes and sizes. They range from the little bench shear with a capacity for shearing perhaps a half square inch of soft steel or sheet, up to an eighth of an inch thick, to the enormous machines that will take the end of a billet off.

These machines have made the steel building of today a possibility. They punch the holes for the rivets for the plate girder and the steel ship. Another type rivets them.

Practically every metal working shop finds it necessary to have at least one to cut stock to length and size for further operation. They are comparatively simple and are made by many manufacturers.

Of at least passing interest is the peculiar fact that while the manufacturers of these tools made them for use in structural work they never realized that structural steel built-up frames were much more economical, lighter and in some cases more satisfactory than cast iron or steel. This was first realized abroad and in 1914 German manufacturers were competing very strongly for this business and taking it away from our builders, both because of lower prices due to the much smaller quantity of metal and because of the very much smaller floor space taken by that type of machine.

Today we build them with both structural steel, cast steel and cast iron frames. It remains to be seen whether foreign competition can again displace the domestic article. It may be that we ourselves may be able to compete in the foreign markets as we did but little more than a decade ago.

In buying these machines for the usual shop there is one thing to be borne in mind. There probably will not be many of them bought—usually but one, and this one will be expected to last a life time. Buy it big enough and good enough. Shearing metal is hard work and imposes very severe strains on the machine. Sometimes a piece of hot steel will come through by mistake from the mills. Its shearing strength may reach 150,000 pounds per square inch instead of the usual 60,000, and if it happens to be a piece almost up to the nominal capacity of the machine, something is going to break.

Very often it is desirable to shear a piece of metal much larger than the usual, and if the machine is not chosen sufficiently above the usual run of work in the shop this material must be cut in another and far more expensive way.

The manufacturing machine is by far the more fascinating of the two types. It must be considered in relation to the tools that it uses, for the press of itself is a fairly simple machine with but few refinements. With its equipment of tools it is almost human in ability to do complicated work, and quite superhuman in the amount it can turn out in a day, the evenness and smoothness of its operation and the tremendous power it exerts.

It might be called the "complete sheet metal worker," for such it really is. Its specialty is sheet metal, from the thinnest to about an inch in thickness. As a rule it works this metal cold, although there are cases where it is necessary to heat the stock.

The punch press and its products make one

This is a Bliss No. 410-D Double Crank Toggle Press. These presses are used for many kinds of stampings by many of the automobile manufacturing concerns. One of the E. W. Bliss Company's factories is at Hastings, Mich. Its general offices are in Brooklyn.

Digitized by Google

of the prettiest examples of competitive methods for attaining results. It has cut heavily into foundry, drop forge and machining lines. Except for a few places, it has entirely displaced spinning. Today it is reaching out for the field of wood. Its products in combination with concrete, threaten to displace the wooden partition in buildings and the wooden casing for dwellings. Sheet shelving and lockers, bins, tote boxes and trunks tend to eliminate the more perishable material.

There is a union of four parties—the press, the metal, the dies and the design of the product. About seventy years ago the manufacture of presses was started in this country. Ever since then these four have each alternately limited and spurred on the development of the others.

Sheet metal work is, of course, as old as the hills—one stone forming the anvil and another the hammer which first stimulated ancestors used to turn a nugget of gold or copper or tin into a vessel for cooking or a piece of ornament for the warrior or his wife.

The necessity for armor developed the sheet steel, which was hardened for protection of the soldier. This was forged to shape. The soft metals were beaten out into vessels and vases. When the power press first started to work it also used the primitive soft metals of the ancients—copper, brass, gold, silver and other cold working alloys then known. When Bessemer developed his process for making steel from cast iron there was then offered for the first time a metal which had a small cost per pound and which could be had freely.

A New Field Is Opened

Rolling mills had been developed long before for wrought iron. With this new steel, shortly there were cheap steel sheets available. The characteristics were not exactly right for press operation but a new field for exploitation was opened up. As the demand grew greater the sheet metal was refined, until today it is possible to obtain a raw product for the forming press than will permit of almost undetectable distortion without becoming unsound.

As the sizes of the finished articles grew, the presses grew larger and larger. As the pieces became more complex, shape and varied movements were added to the press, and the more rigid and powerful it was made.

The die makers added to their skill as the demands on them became greater. They learned how to make dies that gave exactly the product required, considering the limitations of the metal and the ways it must be handled to coax it into difficult shapes. As their skill increased they tackled more difficult metals, until today it is possible to have elaborate shapes made from very refractory metals.

They learned also that there were heat treating methods that would bring back to their original ductility and softness. This had been known to all of the old metal workers but equipment was not available until comparatively recently which would permit of properly treating large stampings economically.

Sheet metal probably will never be displaced from its position as the leading metal for stamping and forming but other metals are coming to the fore. There are new brasses and bronzes. Aluminum, nickel silver and monel metal are each reaching out for certain kinds of work for which they are peculiarly suited. Latest in the field is a new series of aluminum alloys which have almost the ductility of aluminum and the strength of steel. They will harden merely by the passage of time or they may be hardened as is steel. They require careful heat treatment before and during forming operations but will extend the available field for sheet metal products.

The tools are daily becoming more efficient. Where a few years ago the products of the power press was the raw material for finishing on other machines, today the sheet metal is fed into the press and the finished article is taken out. The standard of accuracy and finish has been materially raised. The average length of life of the tools has been increased. It is possible today to do economically kinds of work that even ten years ago would have been called absolutely impossible.

The last and equally important element of the problem is the design of the product so that it may be made with ease, economy and satisfaction from sheet metal. Very often a minor change in the design will permit of making a piece on the press at a very low cost with superlative accuracy and finish, with an abundance of strength and very low weight, which otherwise must be made of a casting or a forging with high machining costs and inferior results.

Progress in the use of stampings is perhaps most greatly held back by lack of knowledge of the essentials and the possibilities of this type of manufacturing than by all of the other elements combined. This making of the tools is a trade, an art, which is not generally known. Few designers have a close knowledge of what the requirements of the metal and the process are, and it is more usual to try to force the operation to a pre-conceived design than deliberately to design a product to take advantage of the economies and possibilities of this method of manufacture.

Perhaps no line of machine tools is so little known to the average mechanic or engineer. Certainly there are few who know what metals can be used, the characteristics of these metals after they have been cold worked and the methods of bringing them back to a condition where they will have the characteristics necessary for the piece being made.

The literature covering the subject is far from complete. The catalog of the press manufacturers and the makers of dies is a mere bald list of standard machines and is not such as to give a designer a clear idea of what the possibilities and limitations are. Technical magazines carry articles describing the making of dies for this or that part but there does not seem to be a general treatment of the entire subject. It is undoubtedly difficult because of the enormous number and variety of the parts turned out, but is for that reason more generally needed.

Those who are in lines where the power press has been greatly used probably need a more detailed and accurate knowledge than those where this type of machinery is already customary, for it is evident that the new uses will call for a greater knowledge to overcome the difficulties—practically all of the easy fields having already been conquered.

The Power Presses Themselves

The most important from the point of view of the number in operation and the kinds and amount of work done is the crank press. In the crank press, of which the cam press and the knuckle joint or toggle press may be taken as a sub-division.

This press receives mechanical power either direct from a motor or through a belt to a flywheel or pulley. This pulley is mounted on the crankshaft and connected through a clutch for machines requiring a moderate amount of power, or where the material to be worked is heavy through gearing, either single or double. The crankshaft applies the power to the dies through a pitman in the case of the crank machines, or through a cam or a toggle mechanism.

They vary as to size, from the little machine shown herewith, and which is working on small sewing machine parts and which weighs only a few hundred pounds, to machines two and three times the size of the other one here, and which is making mud guards for automobiles. They are made to take pieces only a few hundredths of an inch wide, to the machines which punch out the sides of automobile truck frames and take sixteen feet between housings.

The stroke also varies from an inch or less to perhaps two feet total. The cam an toggle presses have the smaller range of stroke but deliver by far the greatest pressure. The straight crank presses have the longest stroke, the maximum pressure delivered varying with the position of the moveable die.

The rate of operation of this type of press is far faster than that of any other type. Some of the presses are arranged to have two speeds—one when the belt runs from the flywheel, and another when the reducing gear is thrown in.

The types of frame vary greatly. In the smaller sizes the gap or "C" type of frame is more usual, as this permits of faster operation of feeding and of doing work on larger pieces. There is a rather low limit of rigidity possible with this type and as soon as the pressures increase it is necessary to provide some means of holding them stiff. This is done by making provision for long bolts across the opening to keep the frame from springing.

The larger sizes of machines are made usually with supports on each side, the work passing through from front to rear. The frames are made of cast iron or cast steel, depending on the total amount of pressure to be exerted. Where the pressure is excessive, built-up frames are used with wrought steel through bolts to take the tension strain. This is necessary because cast iron does not have sufficient evenness of texture and strength to prevent unequal distortion under great strain. It also is weak in its strength per square inch as compared with forged steel.

They Vary as to Pressure

Presses also vary in the total amount of pressure that they can apply. It will be realized that a somewhat heavier blow is given by one thirty-second of an inch thick, a much lighter machine will be satisfactory than where material of three-quarters of an inch is being worked. There are parts which are made of inch thick metal. These require very heavy machines.

As the size of the press increases it is necessary to reinforce the upper die. This is done by adding more cranks with supports in the upper frame. The large machines for forming the automobile frames may have as many as four cranks. Where the intensity of pressure is great even comparatively small machines are given two cranks.

The next complications come in the secondary movements which are added to the presses. Some of these movements require comparatively little power; others are main movements. The presses fitted with them are known as the double and triple action presses. As a rule they work from cams on the crankshaft, sometimes inside and sometimes outside of the frame.

These additional movements are what enable the press to perform such a complicated series of operations, in some cases blanking the piece, forming it and embossing it. There may also be provided automatic feed and removal features. These compound operation presses call for very complicated and expensive dies and are therefore used only on work manufactured in large quantities. They turn a single piece out for an unbelievably small sum, using only unskilled labor, which is mainly concerned in bringing up the raw stock and carting away the finished product.

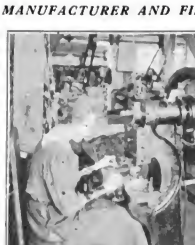
The crank press finds its main field in the cutting, forming and drawing of sheet metal goods, such as tin cans and steelware utensils. The most complicated forms are made with almost no hand labor. They make possible our canned goods industry and the package system of distributing groceries.

There are two types of cans or vessels turned out—the seamed and the seamless. The first is composed of stock which is cut to size, then formed and fastened with seams which are sometimes soldered afterwards. The seams

Digitized by Google

are all made on punch presses. Where the goods are seamless, the stock is cut to a correct size to make the piece and is then drawn to shape. This is also done on the same press and often at the same time.

Pick up an ordinary tin pail and you will notice that the edge is turned over a wire which gives it the necessary stiffness. There are ears on the side of the pail to carry the bail. The bail is of wire closely folded over the ears. The punch press has done it all. The seams were closed on the horning press, the wire was inserted in the wiring die and the ears were placed and riveted with dies as was the handle.



The toggle press works mostly on shallow material. It does all of the operations that the other does and in addition it does the finer kinds of embossing work. These are the presses that turn out our coins in the mint, that make medals, that are responsible for the legends on our can covers.

Of late years there has opened a new field for the crank press—the extrusion of metals. You put a slug into a die, the punch comes down on it and the solid metal is forced out as if it were a liquid—just as you force out grease from a grease gun when filling your differential on your automobile.

Using this method it is possible to make very small diameter thin walled tubes for cartridges, pencils and the like which it would be impossible to draw. The softer metals are used for this purpose. Block tin is used to make containers for tooth paste and shaving soap. Lead is used for the tubes for photo paste, greases and soap. Copper, aluminum and certain kinds of brass can be worked in this way. Steel cannot be so hard for any but the very simplest conditions.

The crank press has another field also—in the drop forge shop, where it trims the flash from the forgings and cuts them from the bar in the smaller sizes. In certain cases it is used for forging. The hull dozer and the upsetter are really crank presses.

To make deep pots a number of draws are necessary and for this purpose large machines have been designed with a number of punches. Blanked material is placed on the first die and

This photo shows an operator repunching sewing machine attachment binder frames at the rate of 12,000 per 9½ hours on a Bliss No. 1 "Stiles" type press. The material is cold rolled steel, .035 inches thick.

is drawn to a shallow dish. It is then moved to the next, and so on until the piece is finished. Where the material is light, there may be a piece on each die at the same time.

This press also uses mechanical power, the ram being actuated by a vertical rack operated through gearing. The stroke of this machine can be made considerably greater than that of the crank press. It usually is used for drawing. The speed is less than that of the crank press but greater than that of the hydraulic.

The operating characteristics of this press are considerably different from any of the previous presses. In the first place the pressure is adjustable and can be made as little or as great as desired at any point of the stroke. The speed of operation is much less than that of other types of presses. There is no limit but the crushing strength of hardened steel to the total pressures which may be obtained. There is scarcely any limit to the length of stroke that is practical.

The work movement of the press is accomplished by hydraulic pressure. Additional speed is obtained by providing quick means of returning the ram to its initial position. Mechanical means sometimes are used, in other cases counter-weights, and in still others, where the movement is from underneath, gravity.

The auxiliary mechanism usually is more elaborate with a hydraulic press than with the other types. Powerful pumps, accumulators, high pressure piping, valves and piston return mechanism all make for complexity. Still it is the only practical method of obtaining very high pressures and long strokes.

Its use in forging has already been mentioned. The field is mainly in the forging of large billets. Here its stroke characteristics, the enormous pressure freedom from hammer blow affects permit of the proper refining of large masses of steel. The pressures are not absorbed at the surface as is the case with the steam hammer but are passed right through to the center of the ingot where the metal is compressed and worked as is necessary to properly refine it.

In the machine shop it finds a considerable field in broaching and in presses for putting on locomotive wheels, flywheels, assembling built-up crank shafts and other pressing operations in which the great pressures and smoothness of operation are ideal.

In the drawing of metal for deep parts or for wire or tubing it is without a peer. It is the best machine for making large stampings of certain intricate shapes.

Perhaps more than any other type of press it finds a field in non-metallic lines. It is the machine used for calking and briquetting ores and fuels and other powders. It presses the oil from the cotton seed.

Henry Ford Asks Tom Edison for a Job

By H. I. PHILLIPS

[*In the Chicago Daily News*]

SCENE: Edison plant.
Time: Plenty.
Mr. Ford enters and asks Edison for a position.
Edison: "Well, Hen, what I do for you?"
Ford: "I'm looking for work."
Edison: "I'm looking for work! Why, Hen, I thought you had the biggest-paying business in the country."
Ford: "Well, it's like this: I'm sick of it; there's too much detail—too many little things to look after."
Edison: "Why don't you make a larger car?"
Ford: "No, I wants get into a new game, something more illuminating and with a brighter future in it."
Edison: "Whatcher gunter do with the flivver business?"
Ford: "Oh, I know a couple of nice young Jewish boys, and I'm gunter let 'em have it."
Edison: "Well, Hen, you're a friend of mine and all that, but I can't give any one a job here who doesn't pass my A-Z test. It's the rules, you know. Do you think you could answer a hundred questions on history, geography, etc.?"
Ford: "The last time I tried it I made an awful mess of it. Couldn't you lay off the history stuff—just as a favor?"
Edison: "No; history is very important in the electric light business. I man who doesn't know, for instance, how long Cleopatra was sick could never string a telephone wire properly; and just fancy employing a man to charge a battery if he couldn't tell offhand what colored vests Henry VIII. wore!"
Ford: "Well, shoot your questions, but I don't like the idea."
Edison: "Who was Paul Revere?"
Ford: "A jockey or something like that, wasn't he?"
Edison: "Correct. Who wrote 'The Star-Spangled Banner?'"
Ford: "George C. Francis Cohan, wasn't it?"
Edison: "Right! Now, who was John Quincy Adams?"
Ford: "He's the feller that writes 'The Conning Tower' in the New York Tribune."
Edison: "Gosh, Hen, you know everything!"
Ford: "Well, I've studied a bit in my spare parts—I should say, my eparc hours."
Edison: "Who was Moses?"
Ford: "Let's not get into any racial dispute."
Edison: "Now, Hen, tell me, who was Hendrik Hudson?"
Ford: "He invented the Hudson motor car."
Edison: "Who wrote 'The Barber of Seville?'"
Ford: "I dunno, unless it was Gillette."
Edison: "Correct, Hen. Tell me something about Mephistopheles."
Ford: "Mephistopheles are young mosquitoes, ain't they?"
Edison: "It's impossible to stick you. What Latin motto was on the original American flag?"
Ford: "F. O. B. Detroit."
Edison: "What is the capital of Soconv?"
Ford: "About $10,000,000."
Edison: "Where is Sedan?"
Ford: "I dunno; I came in a coupe."
Edison: "Name a famous general."
Ford: "General Motors."
Edison: "Where are the greatest tin mines located?"
Ford: "Detroit."
Edison: "Who discovered carbon?"
Ford: "Do you know any car owner who didn't?"
Edison: "How many miles to a gallon."
Ford: "Eighteen or your money back."
Edison: "What does the Monroe doctrine guarantee?"
Ford: "Ninety days' service at any of our service stations."
Edison: "Who killed Ben Hur?"
Ford: "Probably a garage bill for chariot repairs."
Edison: "Where do all the codfish come from?"
Ford: "I dunno. I just keep advertisin' the car and they just flock in from all sides to buy it."
Edison: "Oh, there's no sense going any further; you answer them as well as I could. Take off your coat and hat and go to work."

Durant Begins Construction of Lansing Plant

[By Staff Correspondent]

LANSING, May 23.—Two important developments in the automobile world during the last week have turned the eyes of motordom toward Lansing. This city is to become one of the centers of Durant Motors, Inc., with the construction of a $3,000,000 assembly plant here. It will be managed by Edward Ver Linden, who retires as general manager of the Olds Motor Works to become associated with W. C. Durant.

Durant Motors thus becomes a fact. The preliminary plans have been completed. The actual construction of the first big plant has been started and it will be hurried to completion. By the first of next year the new Durant cars are scheduled to make their initial appearance from the Lansing factory.

The announcement of the location of the Durant plant in Lansing followed the retirement of Mr. Ver Linden and the appointment of A. B. C. Hardy as general manager of the Olds. Mr. Hardy has assumed charge here and Mr. Ver Linden has turned his entire attention to the development of Durant Motors. This new situation makes Lansing the location of the large Olds unit of the General Motors, of the main assembly unit of the Durant Motors and of the great Reo Motor Car Company the big independent.

Lansing's newest automobile plant, the Ver Linden division of Durant Motors, will cost approximately $3,000,000. The excavation and construction work was started late last week. It is to be completed by November 1 and production is scheduled to start by January 1, 1922. Between 2,500 and 3,000 men will be employed, virtually increasing the population of Lansing about 15,000. The plant will be located on 135 acres of land in the west part of the city along the Manufacturers' Belt Line railroad, between Michigan avenue and Saginaw street. The Michigan Railway Company is expected to extend its lines to the plant.

The plant will have about 500,000 square feet of floor space. Besides the main assembling building there will be three supply units, 90 by 400 feet each, for all body processes, motor chassis, machinery, etc.; a wing, 80 by 260 feet, for enameling processes; a wing, 300 by 400 feet, and a warehouse. The buildings will be of reinforced concrete with brick trimmings and plenty of glass, and most of the plant will be two stories high. The plant will be operated by electric power.

The factory will be built by the Christman Construction Company, Lansing, under the direction of E. J. Ketterman, general superintendent, and with Engineer Harry L. Conrad in charge of the engineering details. A large force of men, chiefly Lansing labor, will be employed.

Mr. Ver Linden announces that the incorporation of this division is now under way. The Lansing plant will be the largest assembly plant of the Durant Motors and the only one

EDWARD VER LINDEN

in Michigan. The location of the unit will benefit many local factories, as all accessories and supplies purchased will be bought here. Among the local plants which are expected to be so benefited are the new Ryan-Bohn Foundry, which is located near the new factory; the Auto Body, Motor Wheel Corporation, Michigan Screw, forging concerns; Michigan Brass and Iron and Gerson-Garey, foundries, and smaller enterprises.

This diversity of manufacture was one of the reasons for the location of the unit in Lansing. Among the others were the central location of the city, the railroad facilities and the lack of labor troubles. However, probably the principal cause was the fact that Mr. Ver Linden's home is here and he insisted upon this city.

Mr. Ver Linden came to Lansing about nine years ago with the General Motors Corporation as general manager of the Olds Motor Works. He developed this plant from a production of 2,000 vehicles a year to that many every twenty-six days.

Besides the assembling plant in Lansing, it is expected that Durant manufacturing units will be located in Jackson, Detroit and other Michigan cities.

The other significant move, which is linked with the Durant-Ver Linden project, was the appointment of A. B. C. Hardy as manager of the Olds unit of the General Motors, following the retirement of Mr. Ver Linden. Mr. Hardy has come to Lansing and assumed charge of the Olds factory. His appointment assures a strong head for the local plant.

Mr. Hardy was born in Ypsilanti and after leaving the University of Michigan was with the Wolverine Carriage Company, established in 1892 in Davison, Mich., being secretary and general manager. In 1896 he went to Flint and became vice-president and general manager of the old Diamond Buggy Company, which was merged with the Durant-Dort Carriage Company. Following his return from a European trip in 1902 he organized the Flint Automobile Company, but after building and selling 50 cars, this concern went down under Selden patent litigation. He next manufactured buggies in Iowa. In 1909 he returned to Flint and became associated with W. C. Durant again. He managed the Welch Company in Detroit, the Pontiac-Welch Company and the Rainer Company, Saginaw, which were merged into the General Motors. He later became vice-president and general manager of the Little Motor Company, Flint, and vice-president of the Mason Company of the same city. The Little company was later known as the Chevrolet, and Mr. Hardy had complete charge of this organization when Mr. Durant regained control of the General Motors. In 1918 Mr. Hardy became assistant to Mr. Durant and held this position until Mr. Durant left the General Motors Corporation.

On January 1, 1921, Mr. Hardy was made a member of the operations committee for the General Motors, directing interests in outside companies.

WILLIAMS LEAVES LINCOLN MOTOR

The Lincoln Motor Company, Detroit, has just lost one of its first line executives in the resignation of Le Roi J. Williams as counsel and assistant to the general manager.

Although just over 30, Mr. Williams has made a notable record in the motor industry. He became associated with the interests of Henry M. Leland and Wilfred C. Leland six years ago, and since that time has been prominently identified with their enterprises, both at the Cadillac and at the Lincoln companies. During this period Mr. Williams has not only been a close personal advisor of the Messrs. Leland in their various activities and one of the largest stockholders in the Lincoln company, but also because of his special training as a corporation, patent and trade counsel has taken a leading part in many matters vitally connected with the Lincoln company.

During the war Mr. Williams took a leading part in all of the negotiations with the Government. It was at this time that the Lincoln company obtained the largest aircraft motor contract awarded by the Government. This involved about $17,000,000. Later he represented the company in its tax problems involving many millions of dollars, and passed upon the company's refinancing and reorganization in January, 1920, which was carried out to take up the development of the Lincoln car.

Mr. Williams feels that he has earned a brief vacation and is not prepared to announce his plans for the future.

FRANK H. MILHAM DIES

One of the best known men in the Michigan paper industry, Frank H. Milham, president of the Bryant Paper Company, Kalamazoo, died this week in Pasadena, Cal., of heart disease. Mr. Milham was director of the Home Savings Bank and of the Kalamazoo National Bank and was interested in a score of paper-making concerns but especially in the Michigan industry. He was president of the Eddy Paper Company, Three Rivers and White Pigeon; managing director of the Munising Paper Company, Munising; a director in the Kalamazoo Vegetable Parchment Company and the Illinois Envelope Company, Kalamazoo, and of the Nashwauk Pulp & Paper Company, St. Johns, N. B., and the Whalen Pulp & Paper Company, British Columbia. He was one of the organizers of the Birmingham-Seaman Paper Company.

DURANT ACQUIRES SHERIDAN

It is announced officially that W. C. Durant and his interests have taken over the Sheridan Motor Car Company's plant in Muncie, Ind. This was a General Motors Corporation unit—in fact, it was the most recent new unit in the GMC family. Complete details are lacking, but according to a special dispatch to the Detroit Free Press the deal involves more than $5,000,000 and the sale was completed at a meeting between the higher GMC officials and Mr. Durant. It is further stated that D. A. Burke, who was president and general manager of the Sheridan company, will join the Durant organization and become president of the new company, which will be incorporated under the laws of Indiana. It is said to be likely that several automobile parts concerns in Muncie will become affiliated with Durant due to the chance in ownership of the Sheridan.

TO RESUME OPERATIONS JULY 1

It is reported that the Ideal Furnace Company's plant in Homer will resume operations July 1.

Used Machinery at Attractive Prices

Metalworking and Woodworking

Below is a partial list of used machines that we offer at attractive prices. We invite you to inspect our stock.

METALWORKING

6" x 6" Ingersoll Rand ER-1 Air Compressor
No. 4 Gardner Disc Grinder
14" x 6" Bradford Engine Lathe
No. 2-B Foster Univ. Turret Lathe
No. 3 Carter & Hakes Hand Miller
Gisholt Belt Driven Tool Grinder
Barnes 14" Drill Press
No. 15 Lea Simplex Cold Metal Saw
No. 3½ Sloan & Chase Precision Lathe
No. 2½ Universal Grinding Machine

WOODWORKING

16" Crescent Round Cylinder Hand Jointer
No. 2 Crescent Saw Table
18" Crescent Planer, variable speed
No. 702 Sidney Auto. Hollow Chisel Mortiser
No. 7 Sidney Saw Table
21" Sidney Band Saw
12" Fay & Egan Moulder
No. 110 Fay & Egan Self Feed Rip Saw
12" Berlin Single Cabinet Planer
30" Whitney Double Cabinet Planer

The Weeks Reductions in Motor Car Prices

DURING the last few days more motor car producers have announced new prices. The reductions are far in excess of what had been expected.

It is known that several other manufacturers are preparing or have prepared new schedules of prices, which are likely to be announced at any time.

The Scripps-Booth Corporation, Detroit, cut its prices from $195 to $270, according to body style. Following is the new and the old price schedule:

	New	Old	Reduction
Five-passenger touring	$1,295	$1,545	$250
Three-passenger roadster	1,275	1,545	270
Five-passenger sedan	2,100	2,295	195
Four-passenger coupe	1,950	2,215	265

The Willys-Overland Company reduced prices on the Overland from $200 to $425, and on the Willys-Knight from $195 to $300, effective June 1. The revised prices are:

OVERLAND

	New	Old	Reduction
Five-passenger touring	$ 695	$ 895	$200
Two-passenger roadster	695	895	200
Two-passenger coupe	1,000	1,425	425
Five-passenger sedan	1,275	1,475	200

WILLYS-KNIGHT

	New	Old	Reduction
Touring	$2,195	$2,195	$300
Roadster	1,895	2,195	300
Coupe	2,850	2,845	295
Sedan	2,750	2,945	195

In conjunction with the announcement of Willys-Overland it was stated officially that the new price of Overland cars is $150 less than the lowest price for which this vehicle ever was sold. The present reduction added to the price cut of last September makes a total reduction of 33 per cent since September.

The Maxwell Motor Company, Inc., Detroit, reduced its prices $150, as follows:

	New	Old	Reduction
Five-passenger touring	$ 845	$ 995	$150
Roadster	845	995	150
Coupe	1,595	1,445	150
Sedan	1,695	1,545	150

In connection with the reduction of prices of the Willys-Overland cars, President John N. Willys in the course of a statement says:

"The public wants to buy automobiles but the buying public has hesitated in the hope that price cuts might be made. We have decided to anticipate every possible saving from material savings, and from the savings of volume production, and we are putting our prices at rock bottom June 1.

"We are going the whole route right now. The price is the low price which we have long anticipated we might some day reach on the Overland car.

"At the present we will take a loss on every Overland car we sell but we fully expect to make this up through increased volume and increased material savings."

In the course of a statement on the price situation, Guy Peasley, sales manager of the Olds Motor Works, Lansing, says: "In our model 43-A and model 47 cars we believe we are offering the most attractive values for the price today. When these cars were brought out they were priced at the market values of materials. Should we receive any reductions in the price of materials in the very near future, we would be only too glad to reduce our prices to the motor buying public, but from our experience and observations, it is our feeling that no reductions can be made on our product in the very immediate future, or for the balance of the present year."

BEGINS MAKING FLOORING

The Flexotile Floor Company, Birmingham, which some time ago acquired the Michigan manufacturing rights from the Flexotile Floor Company, Rockford, Ill., has started production. The concern makes a composition floor and other building materials, such as an interior stucco and fiber floor. J. R. Seabright is president.

TRACTION STRIKE THREATENED

As this was written, May 24, it appeared possible that a strike would be called by leaders of the employes of the Michigan Railway Company on the Jackson, Battle Creek, Kalamazoo and Lansing lines as well as on the interurban lines running between those cities. The report came from Jackson that the men had refused to accept the company's decision that when the present wage scale of 60 and 62 cents an hour expired, June 1, men would be paid at the old 1920 rate of 40 and 42 cents an hour. It was said that the company had declined to have the matter submitted to arbitration, nor was the company willing to reduce the present wage scale ten cents an hour only, as proposed by the men.

RENTAL FREE TO IDLE EMPLOYES

The Antrim Iron Company, which recently shut down its Mancelona plant for the summer, has given free rental of its houses to employes while the plant remains idle, says the Grand Rapids Herald. The only condition made is that the men agree to return to their jobs when the company is ready to reopen the plant.

TARDEN WITH FRANKLIN AGENCY

W. J. Doughty, Franklin distributor, Detroit, has appointed Frederick L. Barden sales manager with headquarters at the salesroom, 3745 Cass avenue.

MAXWELL-CHALMERS PRODUCTION

W. Ledyard Mitchell, president, is authority for the statement that the Maxwell division of the new Maxwell-Chalmers, Inc., will increase its monthly production from 2,000 to 3,000 cars after the reorganization has been completed. The Chalmers division will increase output from 500 to 750 cars a month.

F. A. SEIBERLING MAKES STATEMENT

Following a recent stockholders' meeting, F. A. Seiberling, founder and former president of the Goodyear Tire & Rubber Company, made the following statement concerning the change in administration: "My brother, C. W. Seiberling, and myself never our official relation with the company and control of the business passes into the hands of the bankers, as provided in the reorganization plan. Both of us continue our interests as the company's largest stockholders. My successor is E. G. Wilmer, a young man of fine legal training and broad experience in operating business. With the return of the world to normal business there is no reason why Goodyear cannot move forward to a higher plane than it has yet achieved."

OLDS CLOSED A FEW DAYS

The plant of the Olds Motor Works, Lansing, was closed a few days to investigate the manufacture of some rear axles which did not meet the requirements of Olds inspection, according to Manager A. B. C. Hardy. Mr. Hardy says the company is pressed with orders which will keep the plant at high production until at least August 1.

MOTOR WHEEL APPOINTMENTS

John C. Garient has been named factory manager for the Auto Wheel and Gler Pressed Steel units of the Motor Wheel Corporation. Mr. Garient formerly was factory superintendent of the King Motor Car Co., Detroit, and came to the Auto Wheel organization a year and a half ago.

R. S. Irvin has been made advertising manager of the Motor Wheel Corporation. This is a new position made necessary by the campaign to nationalize the corporation's products. He has been head of the sales promotion advertising department for the Evans-Ayres Company, Detroit.

The corporation has started an advertising campaign for the new pressed steel wheel, called the Gler Tuarc. It is manufactured in the Gler Pressed Steel Company's plant.

STEWART-WARNER SALES

Sales of the Stewart-Warner Speedometer Corporation for April were only slightly less than those for April, 1920, according to the president, C. B. Smith. Net profits, after all deductions, for the first quarter of the year were $50,927

FORD PLANT TO BE ENLARGED

It is reported that the Ford Motor Company's tractor plant at Hamilton, Ohio, will be enlarged to employ 5,000 men.

TO CONFER WITH HOOVER

Col. Charles Clifton, president of the National Automobile Chamber of Commerce, has appointed the following permanent committee to confer from time to time with Herbert Hoover, Secretary of Commerce: J. Walter Drake, chairman of the board of the Hupp Motor Car Corporation; Arthur Waterfall, vice-president, Dodge Brothers; E. A. Williams, Jr., president, Garford Motor Truck Company; Alfred H. Swayne, vice-president, General Motors Corporation, and Percy Owen, president, Liberty Motor Car Company. The committee was named at Secretary Hoover's request.

HURLEY DIRECTS McGRAW SALES

W. H. Hurley has been made general sales manager of the McGraw Tire & Rubber Company, succeeding C. E. Humphrey, resigned. Mr. Hurley has been district supervisor of western territory for Ajax Rubber, but previously had been with McGraw in several capacities.

ELGIN MOTOR CAR STATEMENT

The Elgin Motor Car Corporation, Argo, Ill., reports that its sales for 1920 were the best in its history, totaling $7,383,606, as compared with $6,479,100 in 1919. Net profits amounted to $191,086, as compared with $104,272. The balance sheet shows assets of $4,572,638 on December 31, 1920, as compared with $3,621,480 in 1919. Among the liabilities were notes and accounts payable of $1,000,000. Commenting in connection with the report the following statement is made to the stockholders: "Since our statement of December 31 we have reduced outstanding obligations $344,425, which is an unusually good record under the prevailing conditions."

MOORE MANAGES GOODRICH BRANCH

William H. Moore has been made branch manager in Detroit of the B. F. Goodrich Rubber Company, succeeding R. C. Hargreaves, resigned.

AMERICAN BROACH'S PROGRESS

Francis J. Lapointe, head of the American Broach & Machine Company, Ann Arbor, was the principal speaker at a recent luncheon given by the Rotary Club of that city. He said in part: "Broaching means greater production for the same outlay in a big reduction of time. It will only be a short time before we expect to broach cylinders. We are experimenting in that line now and have every reason to believe we will be successful. During the war we succeeded in broaching guns for submarine chasers in one hour and fifteen minutes, which previously had taken about 84 hours by other processes. The construction of broaches is a delicate operation and about 20 per cent of the tools are lost in the tempering and straightening process."

SKELDON OPENS DETROIT OFFICE

The Joseph L. Skelton Engineering Company, 242 Water street, Toledo, which makes a specialty of municipal and general power plant construction, has just opened a Detroit office at 1156 Penobscot building in charge of H. E. Heilman. The company has just finished a power plant for the Monroe Paper Products Company, Monroe, which it designed and built complete, and is installing an addition to the new plant of the River Raisin Paper Company, Monroe. It also acts as representative for the Ames Iron Works, Oswego, N. Y.; Houston Stanwood & Gamble, Cincinnati; the American Steam Pump Company, Battle Creek, and several other lines. It operates its own machine and pipe shop and does general machine repair work.

N. A. D. A. Speaker Makes 7 Tax Recommendations

Another effort to have some of the heavy tax burden removed from the automotive industry was made a few days ago before the U. S. Senate finance committee. This time it was the National Automobile Dealers' Association, for which H. B. Harper, Philadelphia, chairman of the association's tax committee, appeared. Much of the taxation levied on the industry, he said, was for the war emergency, but now that the war was over, it had the aspect of "highway robbery." His attempt to show how small the amount of the taxes collected was used for highways was cut short by Senator Penrose, chairman of the committee, who declared impatiently that all that information had been submitted by automobile manufacturers.

The interest of the committee was aroused, however, when Mr. Harper made seven recommendations relative to taxation. They were as follows:

Economy in federal expenditures.
Repeal of the excess profits tax.
Repeal of the higher brackets of personal income and ex-surtaxes.
Repeal of all special excises.
Moderate protective tariff.
Funding of war debt over a period of 50 years, and
Enactment of a gross sales tax not exceeding 1 per cent.

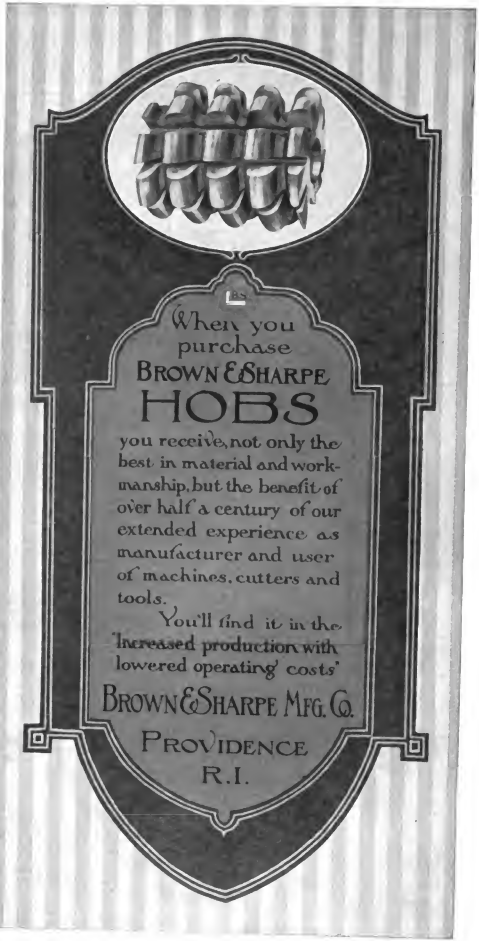
Mr. Harper closed his appeal with the statement that past experiences had shown that such taxation as is now in effect had discouraged industry, which was the effect excises taxes were having on the automotive industry.

WILDMAN PLANT CONTRACT LET

Award of the contract for the construction of the first unit of the Wildman Rubber Company's plant in Bay City is announced by President W. W. Wildman. The three-story and basement structure will be 365 by 161 feet in size. The Bay City Stone Company put in the foundations and will complete the building. There has been a rather long delay in getting the work started, but that was due, it is said, to the fact that prices of building materials were considered entirely too high and it was decided to wait a while.

The plant will be of such a size as to permit the making of 2,500 tires and 5,000 tubes daily, and when conditions make it necessary to expand, the company has sufficient land for plant extensions which will eventually make possible an output of 50,000 tires and 100,000 tubes a day.

FRANKLIN'S BUILDING PROGRESS



Announcement is made by the H. H. Franklin Manufacturing Company, Syracuse, N. Y., that its building expansion program, started last year, is going on to completion and that when the work is done the Franklin plant will be the largest in the city. The plans include a seven-story manufacturing and warehouse building which will have 360,000 square feet of floor space. The interior construction on a new power house is also being rushed. It is expected that the buildings will be ready for occupancy by September 1.

OAKLAND OUTPUT INCREASED

According to a report from Pontiac, production at the Oakland Motor Car Company plant was increased this week from 75 to 100 cars a day. George H. Hannum, the new general manager who succeeds F. W. Warner, took up his new post this week, while Mr. Warner will remain for a short time to help him.

BUICK DISTRIBUTORS' MEETING

Branch managers and distributors from forty sections of the country attended a conference on plans for the 1922 sales campaign held this week at the Buick plant in Flint.

TWO NEW MICHIGAN ROUTES

Every week sees the establishment of additional motor bus routes in Michigan. John Burke, Marquette, has established a line between Marquette and Ishpeming, largely for the accommodation of miners between these two cities. The route is proving popular also for residents along the way, who use it for buying expeditions.

Another lower peninsula route has been established by T. O. English, of Woodland, who will operate buses between Woodland and Ionia, making stops at Hastings, Coats Grove and Lake Odessa.

STARTS WITH 100 TRUCKS

One hundred motor trucks, to carry freight between New Orleans, Washington, St. Louis and Cincinnati, have been put into service by the South-Eastern Express Company, of which J. B. Hockaday, New Orleans, is president. Service began a few days ago. Most of the trucks are two-ton and all equipment will be standardized eventually.

SOME DATA ON OPERATING COSTS

A Chicago tire concern has been operating trucks of varying sizes between that city and Milwaukee, well loaded with all kinds of commodities, in order to test out the service that its tires would give.

The following figures are submitted on the performance of a three-and-one-half-ton truck, equipped with pneumatics:

"The record sheet shows fourteen round trips and a total mileage of 2,806. The truck consumed 352 gallons of gas a week or at the rate of 7.966 miles a gallon. It used 151.2 gallons of oil, or a mileage of 187.6 a gallon.

The gross weight of freight carried was 122,300 and the running time 168 hours.

Figuring truck depreciation at the rate of 31.3 cents a mile, including 6 per cent interest on the investment, hours of overtime, including several hours spent in assisting a five-ton solid tired truck through the sand and towing them in after burning out a bearing, the total weekly cost amounted to $405.47, or at the rate of $1442 a mile. The cost of shipping by freight would have been $457.80.

In compiling the weekly truck operating cost of $405.47 the tire company included the cost of cartage, inasmuch as this latter se under contract.

This, alone, would have effected a s $100 in favor of the truck operation wi matic tires

BUS SERVICE IN CALIFORNI

In its mere infancy only a few yea the automobile transportation industry a huge one, carrying more than 5,000 sengers to various points in the cou year. The commercial traveler as we pleasure-seeker is beginning to deper Already it has materially assisted in up the famous "playgrounds" of Califo Nevada such as the Yosemite Valle Tahoe region, Rim of the World and National Park. More than 3,600 car daily passenger service.

More than 70 buses operate out o daily to all parts of California. Their s are so arranged that the 3,000 passen patronize them each day can make co without long delay at the terminals.

figures available showed an invest $350,000 in equipment in Fresno alo haps the most startling fact the inve uncovered was the unusual safety of t portation in comparison with other carriers. For the percentage of injur any cause whatsoever in handling people was less than .001 per cent.

In Stockton, too, bus lines have m strides forward. The records show March, 1921, the affiliated lines ser than 40,000 people. Most of these p were carried in twenty-six large buse accidents, in the last two years appro 75,000,000 passenger miles there has one fatality.

Out of Sacramento alone there are type buses arriving and departing dai ating on a two-hour schedule during year, they have handled approxim people a day to points within a 50-m of the city.

The greatest single impetus that given the motor stage lines was the ment of through routes and conne different motor companies and the c ing of terminals into union stations. was first perfected in Los Angeles rapidly extended over the larger pa state.

State Cartage Directors Hold Meeting in Lansing

[By Staff Correspondent]

LANSING, May 24—A drive for members and against unfavorable laws was launched by the directors of the new Michigan Highway Transportation Association at a meeting in the Hotel Kerns, Monday, May 23. It was decided to contest the village ordinance of Watervliet which provides for a special license for any vehicle being used for hire.

The proposed state bill covering the weight and size of trucks using the state highways was generally discussed and the Association went on record as favoring a bill which would limit the weight to fourteen tons. A resolution adopted also states that when the Michigan license is fixed the law should not permit any city or village to assess an additional license for inter-city hauling.

With the Detroit and Grand Rapids local associations, the state organization now has a membership of about 600. It is the aim of the Association during the campaign for members to increase this number to at least 1,000. Henry H. Stevens, Flint, chairman of the membership committee, will have charg drive. Other members of this comm Guy P. Downing, Lansing; A. H. Sha Rapids; J. C. Dowding, Flint, and D nerrette, Ann Arbor. The state will b into districts, with a captain and sub- for each district. It is intended to v commercial truck and bus owner in explain the purpose of the Associ endeavor to enlist his support. The membership fee is $5, with annual d For local associations the fee is $25, capita tax of 50 cents, a minimum c maximum of $100.

The Watervliet ordinance, which h provides that the trustees may deci tain places where vehicles for hir stationed to solicit business, with a $ fee for the transportation of passe further says:

"Section 11. No person shall use o be used or caused to be kept on the the village of Watervliet, on or alo the village depot grounds in said vi dray, cart or wagon for the purpose porting or hauling any freight, baggag hold goods, merchandise or other ar hire, or rent or loan the same to be h ou first having obtained a license the the village of Watervliet; and no lice

cart, wagon or automobile shall occupy, while waiting for employment, any other stand than such as may be designated by the trustees of said village, which stand may be changed by said trustees when deemed expedient. There shall be charged and collected for the use of the village of Watervliet under this section for each dray, cart, wagon, automobile or other vehicle the sum of $25 per year or any part thereof."

The license number is to be plainly visible, the license may be revoked by the trustees for non-compliance and violations may bring fines not to exceed $100 or imprisonment in the county jail not to exceed 60 days, or by both fine and imprisonment. No license may be transferred. The ordinance took effect May 15.

Under such a measure it is figured that a truck owner delivering goods in the village from another city might be required to have a license. O. L. Alden, a member of the Association, runs a bus line from Benton Harbor into Watervliet but charges nothing for riding in the village. Backed by the Association Mr. Alden will decline to pay the license and abide by the ordinance, and the matter will be carried to the courts. Secretary H. H. Hardy was instructed to inform Watervliet officials of the decision of the Association.

By-laws were adopted for the local associations. It was voted to apply for membership in the National Team & Truck Owners' Association. An invitation was received to attend the national convention and boat trip at Detroit, June 13, and several members of the executive board will be present.

The bonds of the secretary and treasurer were fixed at $500 temporarily.

Those present at the meeting were President E. Foster Moreton, Detroit; Secretary H. H. Hardy, Lansing; Treasurer H. G. Beebe, Jackson, and O. L. Alden, Benton Harbor; E. F. Raseman, Kalamazoo; W. F. Stevens, Sr., Saginaw; H. H. Stevens, Flint, and W. J. Le Strange, Mount Pleasant.

New Safety Campaign in Progress This Week

Detroit's sixth public safety campaign opened Monday with 25,000 persons engaged in promoting propaganda and education through every channel of the city's life. Governor Alex. J. Groesbeck issued a proclamation making the week one for safety promotion, and Mayor Couzens issued a similar proclamation for the city. Campaign flags, consisting of green cross on a white field, have been displayed prominently, and at prominent corners large metal signs have been erected. The slogan of the campaign is "Safety First Always."

Monday morning the safety campaigners marched from Grand Circus park to the city hall, where they were received by the Mayor. This ceremony was followed by safety meetings in various parts of the city. A phonograph, said to be the largest ever made, and mounted on a motor truck, was driven along Woodward avenue from the river to Highland Park and records containing lectures on safety used on it during the days and evenings. Eight trucks carrying the wreckage of automobiles were driven about the streets to arouse motorists to the importance of safe driving.

Judge John Faust addressed the noon luncheon of the Exchange Club, Hotel Statler, and Mayor Couzens, W. S. Gilbreath, manager of the Detroit Automobile Club, and George A. Walters, deputy commissioner of police, spoke at open forum meetings in the Real Estate Exchange building. Other meetings were held in schools, churches, in Cadillac Square, the Y. M. C. A. and other public places. Literature was distributed by the Girl Scouts and the Campfire Girls.

Sixty or more communities throughout the state are interested in the campaign also.

ANOTHER KNIGHT CAR

The Sterling-Knight Motor Company has been organized in Cleveland to manufacture a motor car which will have a six-cylinder Knight engine. P. H. Withington, Toledo, president of the Sparks-Withington Company, is president of the new corporation; J. G. Sterling, for eighteen years chief engineer of the F. B. Stearns Company, Cleveland, is vice-president and chief engineer, and J. V. Thomas is sales and distribution manager. The enterprise is backed by Cleveland capital.

FEDERAL GUARANTEES TILL OCTOBER 1

Prices of Federal motor trucks have been guaranteed until October 1. A statement issued by W. C. Rowley, an executive of the company, says in part: "While there has been some slight reduction in the price of steel recently, the cost of manufacture has not been affected thereby, as labor and other items of cost do not warrant any reduction." The previous price guarantee of the factory, made November 18, 1920, was up to July 1, 1921.

Haynes' Resignation From Dodge Brothers Denied

The persistent rumor that Frederick J. Haynes, president and general manager of Dodge Brothers, had resigned and was preparing for an extended trip through Europe, has been emphatically denied at the plant. A. T. Waterfall, vice-president and assistant general manager, said that the rumor emanated from certain business rivals in New York city and should be given no credence whatever.

TRANSPORTATION NEWS

Rail :: :: *Water*

Washington—In the case of the Barnett Oil & Gas Company vs. the Director General of Railroads, as agent, the Chicago & North Western Railway Company, et al., the Interstate Commerce Commission has decided that the rates on gasoline and its products in carloads, from Blue Island, within the shipping limits of Chicago to nearby destinations in Illinois, Wisconsin, Michigan and Indiana, are not unreasonable, unjustly discriminatory or unduly prejudicial and has dismissed the complaint. The case, which was No. 10305 on the Commission's docket, was submitted October 13, 1920, and decided May 5, 1921.

Lansing—The structural steel work on the Prudden office building was started this week by the Rickman Construction Company. The footings are piers of cement, 10 by 12 feet, sunk below the basement of the old building, and sufficient to sustain the weight of ten stories.

Lansing—The footage sold in Lansing and vicinity at present is much larger than a year ago, according to Lansing lumber dealers. Hundreds of repair jobs, remodeling, additions, and garages are being done. The construction of houses is expected to receive an impetus by the announcement that the big assembling plant of the Durant Motors, Inc., will be located in Lansing. This factory is to cost $3,000,000, to employ 3,000 men and to be completed by November 1.

Washington—The Interstate Commerce Commission has found, in the case of the Steel & Tube Company of America, et al. vs. the Director General of Railroads, as agent, the Michigan Central Railroad Company, et al., that the rate on steel car-plates, in carloads, during federal control, from Indiana Harbor, Ind., to Michigan City, Ind., were unreasonable, and has awarded reparation. The case, which was No. 11052 on the Commission's docket, was submitted November 15, 1920, and decided May 3, 1921.

Lansing—The attorney general has filed with the Michigan Public Utilities Commission a petition on behalf of the public, asking a hearing on the rates charged by the Mackinac Transportation Company, St. Ignace, for carrying automobiles across the straits between Mackinaw City and St. Ignace. The attorney-general alleges that the rate is too high.

Why the Court Dismissed the Lucking-D. & C. Suit

The reasoning which prompted Judge Arthur J. Tuttle, of the United States district court, last week to dismiss the suit of Lucking vs. The Detroit & Cleveland Navigation Company to prevent the latter from discontinuing certain of its routes, is that the company, not being bound by franchise obligations, is at liberty to cut off such service as it desires. The company had raised, in its motion to dismiss the case, two questions, first that the court had no jurisdiction and, second, that the plaintiff was not entitled to the relief asked. The court overruled the first contention and proceeded to consider the second, as follows:

"The question presented is whether a common carrier by water, after establishing several regular routes for the transportation of passengers and freight by vessel, in both interstate and intrastate commerce, is under any legal obligation to continue to operate its vessels in such transportation over all of such routes in the absence of a franchise or other arrangement with the state, imposing upon it such an obligation.

"No authority, however, has been called to my attention and I have discovered none, to the effect that a common carrier such as the defendant here, not enjoying any public franchises or exercising any public powers or privileges, is bound, after commencing to operate vessels over a certain route, to continue such operation, if it finds it desirable to discontinue and abandon the same.

"It is true that common carriers, like rail road companies, which enjoy peculiar rights and powers at the hands of the state, are not permitted to discontinue at will the rendition of transportation services, for the performance of which they have been endowed with such special privileges and powers.

"The reasons, however, which underlie and prompt the imposition of this duty upon common carrier railroads do not apply to common carriers such as this defendant, because they have no privileges and rights other than those held by a private individual desiring to engage in the business of transportation of passengers and freight by water. It cannot exercise the power of eminent domain. In the eyes of the law it occupies no different position than that of a common carrier operating taxicabs or other vehicles on land, and it is under no greater obligation and I am clearly of the opinion that in the absence of some statutory provision applicable, the plaintiff is not entitled to the relief prayed."

STUDEBAKER PRODUCTION PLAN

Officials at the plant of the Studebaker Corporation announce that the June production schedule will call for 8,600 cars. During the first six weeks of the second quarter of 1921, sales are given as 10,000, and unfilled orders as 7,600.

SPEAKS GOES TO LONDON

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Battle Creek—The Purity Stamping Company, of which W. T. Hulcher is president, contemplates the erection of a two-story plant. The company manufactures milk strainers.

Detroit—Statistics from the city building department for April disclose that 1,509 permits for new buildings to cost $5,079,450 and 560 permits for alterations and additions to cost $465,301 were taken out. The total number of permits was thus 2,069 and the cost involved $5,544,751, as compared with 2,227 permits for new buildings to cost $11,189,325 and 640 permits for additions and alterations to cost $1,268,210, or a total of 2,867 permits involving an expenditure of $12,397,535 for April, 1920. The 1,509 new building permits listed during April were distributed as follows: 993 automobile sheds, barns, etc.; 321 single residences; 58 two-apartment residences; 41 stores; 19 stores and tenements providing 36 stores and 49 apartments; 11 tenements providing 96 apartments; 11 major garages; 10 factories and shops; eight storage or lumber sheds; six warehouses; three churches; one office building; one theater; one school; 25 miscellaneous buildings.

Grand Rapids—There were applications for 89 building permits during the week ended May 13. The expenditure involved was $79,065. The majority of the permits were for dwellings and garages.

Detroit—Among the contracts awarded by contractors during the week ended May 19, as reported by the Builders & Traders' Exchange, were the following: Three schools; a store and office building; a printing establishment; a garage and a large show stable, the latter for the Michigan State Fair. Among projects reported by architects are several stores, a market and residences.

Royal Oak—During March and April 53 building permits were issued involving in cost $457,965. The list is headed by the First State Bank building, to cost $225,000, and the Baldwin Theater, which is to cost $125,000.

Grand Rapids—A four-story addition, 40 feet wide, is being completed at the plant of the Hekman Biscuit Company, which will practically double the company's capacity.

Lansing—Work has been started on the new warehouse and offices of the Brick Supply Company, which, it is said, will be among the largest building material warehouses in the state. The buildings are to be completed in about five weeks.

Detroit—Samuel S. Kaplan has purchased the property at the northeast corner of Jefferson and Lakeview avenues, on which he will build a two-story public market building with stalls on the first floor and offices for the Economy Market Company on the second.

Detroit—The department of public works, lighting commission, water commission and the street railway commission will adopt the two-shift system on public work. This system will add 3,000 men to the payroll of the department of public works.

Grand Rapids—The Metal Office Furniture Company has awarded the contract for an addition to its plant to the Owen-Ames-Kimball Company. The structure will be two stories high, 150 by 150 feet, and will cost $50,000.

Grand Rapids—The high mark for a week thus far this year was attained during the week ended May 20, when 102 permits were issued involving an expenditure of $217,450, or in excess of $60,000 over the previous high week. The list of permits is headed by a three-story school building to cost $80,000. Next comes a permit for a four-story addition, 60 by 120 feet, to the plant of the Gunn Furniture Company, to cost $37,500. The American Seating Company is to put up an addition which will cost $10,000. A score of permits were for residences and frame houses to cost from $3,500 to $6,500 each.

Jackson—During the week ended May 21 a total of 18 permits were issued, of which three were for new buildings.

Detroit—The board of fire commissioners will receive bids until 4 p. m., June 6, on the construction of a ladder house to be erected at McGraw and Martin avenues.

Detroit—The common council Tuesday approved of the award of contracts for the construction of the Belle Isle bridge. All work except the steel superstructure will be done by Grelling Bros., Green Bay, Wis., who will receive $2,011,895, while the superstructure will be built by the Wisconsin Bridge & Iron Works, Milwaukee. The latter's bid was $354,135. The work is to be completed in twenty-seven months.

Each Accuses Other In Building Confab

When it became quite certain that no amount of "coaxing" investments in building operations this summer by "inflated" optimism was likely to create a resumption of building activities, the Detroit Board of Commerce adopted the only method of getting at the facts by calling a conference of all the interests concerned in construction work. The result was a meeting of 250 manufacturers and dealers in building materials, contractors, labor representatives and bankers, in the Board of Commerce, Tuesday.

The result of the meeting was nothing less than a "deadlock," because no representatives of any of the interests involved would assume responsibility, while some were inclined to shift the blame to other shoulders. The bankers, if any one, had the best of the argument, for when the four-hour conference was over, the only conclusion that could be reached was the real one—lack of finances. In turn, the lack of finances was shown to be due to lack of deflation in the prices of some building materials, and the lack of employment. This latter factor naturally reduced deposits from which building loans are made.

As shown some time ago in an article in the Michigan Manufacturer and Financial Record, on the building situation, the lack of such facilities as building loan associations and the absence of proper encouragement for those in existence (five) influenced the situation. The statement made in that article to the effect that Detroit did not appear able to finance its own home building and that outside money was sorely needed was borne out by the deliberations of the conference.

While a review of comparative prices of building materials and work for 1920 and 1921 indicated a drop of 30.8 per cent in a certain class of materials and seven division of labor, no evidence was given to show any appreciable approach to 1914 prices. The list of percentage reductions submitted at the conference follows:

Lumber and mill work, 51.8 per cent; mason work, 18.5; paint materials, 18.1 wall paper, 36.4; plumbing (limited), 26.5; plaster, 31.1; trimming, 14.5; wiring, 27.3; fixtures, 16.7; furnaces, none; glass, 23.4; hardware, 9.7; window shades, 14.9; curtain rods none; carpenter labor 20.5.

In 1914 a plumbing set for an ordinary home

Digitized by Google

such as a worker in moderate circumstances would build cost $165; in 1920 this cost went up to $570, and at present it is $380. The mention of Detroit brick selling at $19 a thousand as against $12 a thousand in Chicago brought the statement that Detroit brick was better than the Chicago brick and was being sold at "bottom" prices.

Contractors were represented as on the verge of bankruptcy as the result of the bids being made. Investors in building enterprises were accused of seeking too high returns. Banks were charged with being too niggardly with loans. Labor was charged with resisting wage cuts. Labor charged the contractors with being "parasites" on the industry. As nothing was to be gained by the orgy of charge and counter-charge, the conference asked the Board of Commerce to appoint a committee to do these three things:

Ascertain why the costs of certain building materials had not been cut in ratio with reductions in other items.

Ascertain the reason for the high cost of financing building.

Ascertain from manufacturers and employers the probable employment situation in the near future.

Michigan Purchasing Agents Condemn Printers' Strike

Through general policy, the various divisions of the National Association of Purchasing Agents have never been actively concerned with labor conditions. However, the action taken by the unions for the printing industry is deemed by the purchasing agents to be so contrary to the industrial welfare of the whole country that the district associations have felt called upon to take a definite stand.

The following resolution, originally wired out by the Purchasing Agents' Association of Chicago, has been indorsed by both the Purchasing Agents' Association of Western Michigan and the Purchasing Agents' Association of Detroit, which, together, comprise the entire state of Michigan:

"Whereas, the unions in the printing industry at this time are demanding a reduction in hours of work from 44 hours per week and whereas the employing printers are resisting the demands of the union with a view of bringing their industry back to a normal and reasonable basis, and as a result of such resistance, have had their shops closed by a strike of their employes, and whereas many users of printing represented by the purchasing agents throughout the country will be greatly inconvenienced through this action, and whereas, a reduction to a 44-hour week will raise costs of printing in the face of an economical demand for a reduction in prices, for this reason, be it resolved:

"That this association will advise its members of the commendable attitude taken by the printing industry and urge all buyers of printing to support in every way the employing printers in their efforts to co-operate with all other industries in returning business to a normal and economical basis.

"Be It Further Resolved, That this action of the Purchasing Agents' Association of Chicago be communicated to the National Association of Purchasing Agents and request that copies of this resolution shall be circulated to the different local purchasing agents' associations, also that it be communicated to the press and to the various employing printers' associations."

BUILDING BIDS SOUGHT

James S. Bicknell, cashier of the Citizens State Bank, Clare, writes that there will be an $85,000 hotel built in that city this summer, in addition to a school building, bonds for which have just been purchased by the Detroit Trust Company. He says the authorities would like to get into touch with contractors who would like to bid on the jobs.

A Machine Tool Service Station

In Detroit
where so many Warner & Swasey turret lathes are operating a Service Staton is imperative,
so we put on at 5928 Second Boulevard.

Two practical men are there to serve you—
Men who know Detroit and its vicinty
and who know Warner & Swasey Turret Lathes,
C. S. Stilwell, Manager, and Wm. B. Pope.

Turret lathes of each size are on exhibit there.
You can buy one right off the floor if you like,
and equip it with tools from the stock we keep there,
or you can buy tools for the machnes you have.
Our tools are adaptable to any make turret lathe.

Come and look us over—or telephone us.

DETROIT, SATURDAY, MAY 28, 1921

Henry Brockholst Ledyard

FROM 1818 to 1921 is a long period for any industry, especially in so new a territory as Michigan, to be ruled through the lives of two men. Yet that is exactly what has been the experience of the railroad industry in Michigan. These two men were James Frederick Joy, long since passed away, of grateful memory to those who have profited by railroad transportation in Michigan, and Henry Brockholst Ledyard, of equally grateful memory, who has this week passed to his reward.

With the death of Mr. Ledyard but one of the old-time railroad managers whose services have influenced the development of Michigan railroads remains, that one being Chauncey Mitchell Depew, the great New York railroad lawyer who has seen all the great associates of his lifetime pass on. He, too, was an influence in Michigan railroad development, though more remote than the two whom we have named. To Mr. Joy and Mr. Ledyard Michigan owes more than to any other men who were active in the laying of its great industrial foundations. Joy was the grim but dashing promoter, a promoter not in the modern sense of the word but rather in the purer one, a man who had vision, who had ability, who had the confidence of the capitalists of his period and who justified that confidence by seizing situations, improving them sufficiently for the time, and leaving to later comers the duty of putting the enterprises on firm and lasting foundations. Joy's genius reached out afar. He took the Michigan Central railroad from the state when it was a bankrupt enterprise, pushed it on from Ypsilanti to Lake Michigan, foresaw the possibilities of the great west and got his great capitalist associate, John Murray Forbes, to endow his ideas with money. He started the Burlington road westward from Chicago. He had to do with a railroad running southwesterly from the Missouri river. He was the first to give practical value to the idea of a canal around St. Mary's Falls, between Lake Superior and Lake Michigan.

In these daring enterprises he surrounded himself with many able young men. It is surprising how few of these became dominant in the industry to which their patron devoted his life. None was more dominant than the young man who came into contact with him, fresh from the army, in 1869, a youthful West Pointer, as superintendent of the Eastern Division of the Chicago, Burlington & Quincy Railroad. He drafted him into the service of the Michigan Central Railroad forty years ago as an assistant superintendent. This young man was Mr. Ledyard, who became successively superintendent and general manager of the road, until 1883, when he succeeded to its presidency.

Mr. Ledyard came to the direction of the Michigan Central railroad at a time of as great change in the railroad business as has been witnessed in any of the other public utilities which have become familiar since the development of the steam railway. In the first instance railroads were built to get them going. Questions of grade, of rail structure, of motive power, of permanent bridges and the like were left for the future, if they were even understood. One can appreciate the kind of a railroad that the Michigan Central was when Mr. Ledyard took hold of it as its practical manager from the report made to the state in 1872. In that report it is set down that there were two iron bridges between Detroit and Chicago. The rest were of wood. In that same report it is set down that an experiment had been made with the newly-devised steel rails, and that a quantity, less than 200 tons, had been laid in the previous year. There was a note of uncertainty as to their practical value in the report to the state. What this meant was that the entire railroad system constructed between 1848 and 1872 had become obsolete, and that complete reconstruction had to be accomplished. It is not quite certain to the writer when Mr. Ledyard's authority in regard to the disposition of corporate earnings became dominant, but it was very early. From its first day his financial policy was to provide corporate funds at low rates of return and to keep the dividends upon the company's stock down to a modest but constantly paid figure. The railroads made some money in those days and the practice of other managers had been to seek to earn and pay large dividends to attract new capital. Mr. Ledyard's policy became one of applying excess earnings to the rehabilitation of the property and its modernization according to the new standards of railroad engineering economics. The wooden bridges passed and were supplanted by metal ones. The iron rails passed and were supplanted by steel rails of successively greater weights. The grades were reduced. The motive power came up in efficiency. The rolling stock was replaced with newer, more capacious and more lasting freight cars. The passenger equipment of wood passed and was replaced by steel. It is noteworthy that, during all this period of replacement, renewal and reconstruction the capital stock of the Michigan Central railroad never appreciably increased in amount above what it was in 1872, an economic policy that was good no less for the owners of the property than it was for the users of the facilities which the railroad created. Mr. Ledyard's conservation of the large earnings of "fat" years for the necessities of the lean ones, and his well defined policy that maintenance and depreciation were proper charges to the beneficiaries of the service rather than against new capital brought into existence during his time a new Michigan Central railroad plant, fit to cope with any of the demands made upon it as a transportation unit, and strong enough to carry any normal burden placed upon it.

So much for his financial policy. This conservator and upbuilder was not lacking in vision. Where Mr. Joy forty years ago had looked to the West as the feeder of the Michigan Central, Mr. Ledyard looked to the East. Mr. Joy entered upon the construction of the Chicago, Burlington & Quincy road as "a feeder of the Michigan Central," to quote the language of John Murray Forbes, and intended it to be about 150 miles in length. Mr. Ledyard saw the possibilities of feeding from the East and his development of the Canada Southern division into a great railroad taking its share of the traffic west from Buffalo, was a lifework, which finally culminated in his realization of the Detroit River Crossing, the greatest engineering project of recent years which has been carried out for the benefit of the commerce and industry of Michigan. Even that work had taken a quarter of a century of study and effort, of decision between an overwater and an under-water crossing of the Detroit river, of modification of existing terminal facilities and of the creation of new ones, of additions to local trackage and a dozen other items. Once decided upon, it was put through in characteristic fashion, completing as one man's life-work, the provision of a true trunk line railroad between Buffalo and Chicago, of feeder divisions from all the great industrial cities of the state, and of a north

Digitized by Google

and south line through the eastern and central portions of Michigan to the straits of Mackinac.

This work was not carried out without opposition and criticism, but now that it is done, the important thing about it was that it was carried out at all. Mr. Ledyard's visible characteristics were those of command, austerity and modesty. He had no liking for the limelight or for public applause. The soldier that was in him at the beginning of his career remained in him until its end. Yet he was not a man to whom the amenities of life failed to appeal. Those who enjoyed his intimate acquaintance tell us that he was full of the wisdom of the books and that even the years of his age were devoted to the study of subjects quite apart from those of his profession or of the industry of which he was so long a directing head. Nor was he averse, under proper conditions, to the dissemination of the experiences of his career. So often as to have been frequent, this paper has enjoyed his confidence in this regard, a number of the articles on railroad management and necessities which have appeared herein, and which he only permitted to be ascribed to a railroad executive of experience, having been his contribution to the knowledge of his fellow citizens.

Some men build their own monuments and some others have monuments built unto them after their passing. Henry Brockholst Ledyard built his own in his own life-time. It is the Michigan Central Railroad system in Michigan, without which Michigan would not be the leader it industry that it is.

A New Bishop Speaks

AFTER one has pondered some of the ill-advised, ill-considered outgivings of certain leaders in the church as regards the latter's position on questiums at issue between capital and labor, it is refreshing to behold a churchman of high estate who believes the church should know whereof it speaks, before speaking, and then should speak with a dignity and a sense of fairness born of an appreciation of its position and its function in the human scheme of things. When one recalls some of the statements in the most recent address of the Episcopal bishop of Michigan—the Rt. Rev. Charles David Williams—in which he made it fairly plain that the church ought to compel its adherents to accept his ('the Bishop's) brand of economics, which is the labor union brand of economics, the following from the consecration sermon of Bishop William T. Manning, of one of the New York Episcopal dioceses, will bring a sigh of relief:

"There are great questions, social, industrial and economic, now before the world in which the church must play her true part. In the movement for social progress the church must not be a mere sympathetic onlooker but the great loving influence and power.

"In the very nature of things the church must feel keenly upon those questions and must be in deep sympathy with those whose lot is hardest and who are at most disadvantage from the present imperfections of our social system. But the church must include all within her sympathy and must minister to all alike. She must sympathize with the problems of the laborer and the wage earner, but she must recognize also the problems of the capitalist and the employer, and she must call upon all equally for right dealing, for the spirit of good will and brotherhood.

"Wherever there is a proved wrong and injustice the church, of course, may, and must, speak. But the church is not commissioned nor endowed with special wisdom to pronounce upon specific political and economic programs. It is the function of the church to inspire men and women to right social actions, to bring the spirit of Christ into all social relationships and into every department of life, but it is not the function of the church to prescribe the economic views which men shall hold, nor the economic systems which they are to adopt. It would, I think, be unfortunate if all of us in the church thought alike on these subjects. I hold it to be the most wholesome and important that all social views which are reconcilable with the Ten Commandments should have their representation within the church and among the clergy. In the church there should be, and there is, freedom of opinion upon these questions to the full limit of consistency with the principles of Christ."

"The church," he says, "is not commissioned nor endowed with special wisdom to pronounce on specific political and economic programs. It is the function of the church to inspire men and women to right social actions, to bring the spirit of Christ into all social relationships and into every department of life, but it is not the function of the church to prescribe the economic views which men shall hold, nor the economic systems they are to adopt."

Measured by this conception of the church's position in our everyday lives, how far out of proportion becomes, for example, the Interchurch Steel Report, based, as it was, on one-sided, embittered testimony and seeking to force upon the American conscience conclusions which in no way squared with the facts as they should have been and could have been brought out. How lacking, again, in the real spirit of the christian church some of the pronouncements of churchmen regarding the Denver strikes.

No, when the church turns agitator for one class as against another class, it distinctly has misconceived its mission and is playing into the hands of groups that not only are un-christian, but are imposing upon the clergy's keen sympathy for humanity to lead it into paths that can bring nothing but lack of respect, not to say ridicule, for it.

When the church has aroused individually in the hearts of men the desire to practice christian principles, the relationships of men in groups will take care of themselves. That is the church's part.

Short Measure Stuff

THESE EDITORS of weekly papers have it soft. As which:

Take George Harvey, f'instance. He goes to Europe, slams his cane down on the table and tells the boys to quit hanging around LaFayette's tomb and the Victory arch waiting for America to do their work. Right away, everybody starts buying his sheet to see what he is going to say privately for world consumption.

Then there's Ford. He begins blasting at the Rock of Ages and transposing the tablets of the patriarchs for his own ends, and every street corner in the world has leather-lunged salesmen peddling his weekly.

We hope that we get recognized before all the jobs that require plenty of talking are filled. We would like to be sent to Tokio but would be satisfied with Berlin. Our paper could save a lot of money that way.

DENTISTRY

"I want some cotton for my tooth,"
Said suffering Mr. Baker;
"I think that I will need enough
To cover a whole acre."
—Lake McLoke

The dentist peered into his mouth,
His patient's need to serve,
He saw a little tooth that ached
And said: "I like your nerve."
—Detroit Free Press

With a steam drill he went to bat,
The pain he did but double;
And boring deep, said, "We'll get
The root of this here trouble."
—Newark Advocate.

And as he worked in Baker's mouth,
While looking right straight down it,
He said that tooth's the real royal thing—
I think that I will crown it.
—Hastings (Neb.) Tribune

He changed his mind and said, "I think
"It would be better yet
"If I pulled these and made you some
"Then you would be all set."

FINANCIAL

The Pound Sterling and Its Price

By A. W. KIMBER

[Editor's Note—Owing to the fact that the price of sterling worked up around $4 recently, which is the first time since June 28 a year ago that this level had been reached, and the importance which the rate of exchange on London is bound to play in future international business, we believe Mr. Kimber's article will prove of interest to students of the foreign situation. He is an authority on foreign bonds and foreign exchange and is the author of several books on these subjects which are given an exceptionally high rating. All over the world the rate of exchange on London is the rate of greatest importance, for bills of exchange drawn on London are to a large extent the currency of international commerce and finance. Even when goods or produce are dealt in between two other countries, payment is made in bills on London, such bills being the world's nearest approach to an international money. The article is reprinted by permission of Paine, Webber & Company.]

WHEN Peru sells sugar to Chile, for instance, the Chilean importer pays the Peruvian merchant with a draft on London for so many pounds sterling. The advantage of this method is obvious, for the Peruvian merchant can use the sterling either to buy goods direct from London or to buy anywhere else in the world a sterling draft being taken by bankers everywhere as the equivalent of local currency at the appropriate rate of exchange on London. The day-to-day rate on London is controlled by the demand for sterling and rises and falls accordingly. In 1914, for instance, the pound sterling sold in New York as high as $7.10. The war, which was because the need of the British government for funds compelled us to pay quickly certain short-term loans contracted in England, and the unusual demand thereby set up, which to pay them forced the price of sterling up.

But commerce between countries is barter, the swapping of goods for other goods, and foreign exchange, the exchange of drafts and cheques between countries, is also barter, not of the goods themselves but of the money of them, a payment in one place being exchanged for a payment in another place. Over the greater part of the world, therefore, the rate of exchange on London merely serves as a basis or indication of the trade balance. The price of the pound at New York is a way of expressing the value of American goods which the pound will buy at New York. Normally it will buy $4.86 worth but when the British demand for American goods is urgent, competitive bidding by British merchants or bankers inclines them to pay more and more for the goods, in other words to take less and less for their pound.

During periods of normal trade movement the price of the pound at New York (the value of American goods it would buy) rarely moved outside the limits $4.84 to $4.89⅛. At $4.84 or below, it was cheaper for the Briton to buy our goods with gold than with a pound's worth of goods; therefore at $4.84 gold would leave London for New York. At $4.89⅛ or higher, on the other hand, the Briton would not take our goods; they were too high; he would send a pound's worth of his own goods and get $4.89⅛ of our gold; with that $4.89⅛ worth of gold the Briton could buy more goods elsewhere than he could get from us. Therefore at $4.89⅛ or higher gold, not goods, would leave New York for London. So smoothly did these processes work that for more than thirty years before the war the highest price of sterling at New York was $4.91, the lowest $4.82.

It is a remarkable fact that at most other financial centers the pound is selling at a premium. In twenty-eight countries sterling is above normal parity in twenty and below normal parity only in the United States, Holland, Canada, Sweden, China, Japan, in Switzerland and at Hongkong.

The reason for the discount at New York is a very simple one. The war created an enormous demand for our goods, and goods were shipped abroad to a much greater value than foreign countries could pay. These transactions were financed in large part by the United States government, which loaned to foreign countries nearly 10,000,000,000 American dollars to enable them to pay for these goods. As long as the American goods were paid for by these American dollars, the price of the pound at New York was not controlled by the value of the goods moving from our shores, and it was possible for government control to "peg" it at $4.76. Shortly after the Armistice this government support was withdrawn and the pound once more stood upon a competitive basis.

All other foreign currencies are selling at a discount in New York; not one of them is at par. Looking at the situation impartially, it is apparent that the discount which is given to all the dollar is at a premium. But this premium is due in great part to the urgent demand from abroad for American dollars to pay for goods exported from this country.

To some extent our exports have been paid for with securities sent here from abroad, and by means of foreign bond issues in this country. But there is still a considerable balance owed us from abroad and it is chiefly the demand for dollars to pay this balance which is keeping up the price of the dollar.

The situation is beginning to adjust itself. The excess of exports for March, 1921, was $132,000,000 against $295,000,000 for the corresponding period of 1920 and $335,500,000 for 1919. Obviously, if this adjustment continues, the demand from abroad for dollars to pay for American goods exported will become less insistent and the price of the dollar will decline.

British Trade Balance

Great Britain for many years has had a heavy excess of imports over exports, the average for some years prior to the war being about $1,000,000,000 annually. This was balanced by the interest and dividends on British foreign investments, which averaged about the same amount. There were other large items of British invisible imports and exports but they virtually offset one another so that the balance was affected as above. During 1919 Britain had an unfavorable trade balance of $3,300,000,000, only partially offset by invisible exports; in 1920 the unfavorable balance was $1,890,000,000, but the British Board of Trade estimates that it was later than offset by invisible exports leaving a balance in favor of the country of more than $800,000,000. Due to this huge balance against Britain in 1919 the price of the pound at New York, which had ranged in 1919 from $4.76 to $3.65, declined in February, 1920, to $3.19. Recovery was rapid and the pound sold in April and May between $3.75 and $3.94, but heavy purchases of dollars to meet the Anglo-French 5 per cent bonds forced sterling down to $3.33 in November, 1920. Since that date the price of the pound at New York has steadily advanced, coincident with the improvement in the British trade balance noted above.

Other discussion of sterling rates has thus far been limited to the movement of commodities and the resultant demand for sterling or dollars to pay for them. This is because the currencies of Great Britain and the United States are sound; both countries are on a gold basis, using gold freely in the settlement of their international accounts; and the price of such currency in terms of the other is controlled, ultimately, by trade balances.

In this period of post-war adjustment there are other factors which influence exchange rates. One such factor is inflation. To what extent is the price of sterling at New York influenced by inflation in Great Britain?

Prior to the war the paper currency of Great Britain was Bank of England notes, covered practically pound for pound in gold. The lowest denomination of these notes was five pounds. The actual circulating medium of the country was gold and silver coins. Immediately upon the outbreak of the war this metal currency began to be hoarded; it was virtually withdrawn from circulation by its chance holders. To meet the currency needs of the nation the government issued a new series of notes in denominations of one pound and of ten shillings; these are known as "currency notes," and it is the total of their outstanding that has been regarded more or less as inflation of British currency. At the end of the first six months the currency notes were covered 48 per cent in gold but successive issues during the war without corresponding increase in gold reduced the gold ratio to to 14⅜ per cent, gold to notes (May 1, 1921).

If inflation of currency in Great Britain had anything to do with the discount on sterling at New York, it is important to note that the process of deflation is well under way. Currency notes outstanding at December 31, 1920, were £367,626,000; at April 30, 1921, this figure had been reduced to £335,838,000. On a percentage basis this is a substantial decrease in four months.

At the same time the purchasing power of the pound, in England, has rapidly increased. The London Economist estimates that average prices in Great Britain are 40 per cent lower than the high prices of last year, the U. S. Federal Reserve Bulletin calculating that them 50 per cent lower. This decrease in prices means increased purchasing power of British currency; the pound will buy more goods; the pound is worth more to those who want British goods or British-controlled goods.

At the same time the British government returns exhibit the old skill in the handling of financial problems. For the fiscal year ended March 31, 1921, the government revenues were £7,600,000 more than budget estimates and the actual revenues for the year exceeded actual expenditure by £230,472,000.

During the year Great Britain reduced her total debt by £248,000,000, and has announced that this year she will pay interest on the advances made during the war by the U. S. government. Last year Great Britain reduced her debt to America by $365,000,000; she has already bought in $45,000,000 of the $150,000,000 bonds maturing in New York next November, and every week shipments of gold arrive here to be used in liquidation of the balance.

All these facts lead to the conclusion that the movement toward normal rates of sterling exchange should continue.

State Income Tax Battle Is Under Way in Lansing

[*By Staff Correspondent*]

LANSING, May 25.—Evidence that the state income tax resolution will meet spirited opposition in the special session of the legislature was not lacking yesterday when the session opened. It appeared certain that the entire Wayne delegation would be solidly against it and that help would be forthcoming from other industrial centers.

The resolution, which is practically identical with the Mosier resolution, which failed in the last session, was introduced by Rep. Peter Lennon. It merely changes the word "shall" to "may," thus making it optional for the legislature to pass an income tax law. Corporations are included, as they were in the Mosier resolution.

That the Michigan Manufacturers' Association does not propose to sit idly by and allow the resolution to pass the legislature, and then take chances on the people's defeating the proposition at the polls, was evidenced in the presence of John L. Lovett, general manager of the Association, in Lansing.

Eight bills were introduced the first day, of which two only are regarded as important. The first of these is the bill of Rep. George Welsh amending the James vocational school law and the other is the soldier's bonus enabling act, sponsored by Rep. Vincent Dacey.

Governor Groesbeck's message makes a number of recommendations, chief of which are the income tax; the bonus enabling act; ports and post district legislation; commission form of government for counties; the short ballot and additional compensation for members of the legislature.

Frank W. Brooks Resigns Presidency of the D. U. R.

Frank W. Brooks, railroad man for 39 years, and who made the Rapid Railway one of the most talked-of traction systems in the United States, has resigned as president of the Detroit United Railway because of ill health.

Born in Waco, Tex., and educated in private schools and the Waco Military Academy, Mr. Brooks finished his schooling at the Texas State College, graduating in engineering. Subsequently he was employed by the New Orleans & Texas Pacific, Queen & Crescent and the Louisville, New Orleans & Texas railroads. In 1895 he left the steam roads and became general manager of the Rapid Railway, the first interurban railway as distinguished from the suburban. It was on the Rapid Railway that the idea of carrying freight and mail by trolley was developed.

When the Rapid Railway was taken over by the D. U. R. Mr. Brooks became assistant general manager, gradually taking over more and more of the detail work from Jere C. Hutchins. In 1915 Mr. Brooks succeed Mr. Hutchins as president. For several years Mr. Brooks has been afflicted with nose and throat trouble. His successor has not been named.

M. B. A. CONVENTION SPEAKERS

The principal speakers for the 1921 Michigan Bankers' Association convention, June 6 and 7, will be the following:

John S. Drum, president of the American Bankers Association, who will speak Monday afternoon.

Willis H. Booth, vice-president of the Guaranty Trust Company, New York, who will speak Tuesday morning.

Prof. David Friday, of the University of Michigan, who will speak Tuesday afternoon.

The subjects selected by these speakers have not been announced.

THE OLDEST HOUSE IN MICHIGAN

STERLING BONDS

We have a selected list of Sterling bonds which are exceptionally attractive. They will pay the purchaser an annual income of from 6% to 9% and show a profit at maturity as high as 100% on the money invested. The safety of these issues is unquestionable. We shall be glad to send particulars on request.

DOING BUSINESS IN MICHIGAN

THE UNITED STATES Circuit Court of Appeals for the Sixth Circuit has affirmed the decision of the District Court for the Eastern District of Michigan, reported in the Corporation Journal for September, 1919, page 47.

The Phillips Company, a Wisconsin corporation, with its principal place of business in Chicago, entered into a contract with the Springfield Realty Company, a Michigan corporation, to equip a manufacturing plant in Detroit with a system of automatic fire sprinklers, for which it was to receive $31,776. Later, additional equipment was ordered making a total of $32,224. The Phillips Company filed a mechanic's lien on the property for this amount. The Springfield Realty Company went into bankruptcy, and in a proceeding to enforce this lien it was contended by the trustee in bankruptcy that the contract for this installation of the equipment was void, because the corporation had not taken out a license to do business in Michigan. The contention of the trustee was upheld by the District Court, and this is now affirmed by the Circuit Court of Appeals. The court in part says:

"In view of the evidence offered on behalf of the appellant, it is clear that the installation of this automatic sprinkler system was not merely an incident to its sale and purchase, for the appellant was not manufacturing sprinkler systems and had none of its own either to sell or install. Its contract with the Springfield Realty Company comprised the whole scope of the business for which it was organized. It could have done no more in the state of Wisconsin, the fact that it employed a Michigan corporation to perform a part of this contract for it, and that this Michigan corporation brought some raw materials from other states to the state of Michigan in the manufacture of its finished product, can, in no wise, affect the appellant's relation to the transaction further than to show that it was not selling to the Springfield Realty Company an automatic sprinkler system manufactured by itself in its home state or in any other state.

"As we have already seen, the status of the sub-contractors cannot fix, change or alter the status of the parties to the original contract. If that were true, the Phillips Company might transfer its entire business activities to the state of Michigan and by sub-contracting with persons or corporations outside that state defy its laws, providing terms and conditions upon which non-resident corporations may do business within the state, and at the same time avail itself of the benefits of the statutes of that state and use its courts for its own protection and to enforce its rights.

"It is true that the Phillips Company may, and probably did, sign this paper writing at its Chicago office; but it was not a contract until signed by the other contracting party, which, from the jurat of the notary public, appears to have been done in the state of Michigan on the 9th of the same month. This contract, however, contemplated by its terms performance by the Phillips Company within the state of Michigan, and the evidence relating to that company's method of performance clearly shows that no part thereof was merely incident to the main transaction, but rather that the contract, in its entirety, was a business transaction, local in its nature and indivisible in character.

"In disposing of this question this court has neither the right nor the authority to ignore the laws of Michigan pertaining to this transaction. It is, of course, unfortunate that the appellant must lose the cost of the material and labor that it added to the fund for distribution among the general creditors of the bankrupt; but that is not the fault of the referee in bankruptcy, or of the court. The appellant could easily have protected itself from loss by complying with the laws of Michigan relating to non-resident corporations doing business within the state. It failed, neglected or refused to do this and the courts cannot relieve it from the consequences of its own neglect."

Phillips Co., vs. Everett, 262 Fed. 341. Corp. Journal No. 98.

FRANCHISE EXTENSION UP

A special election will be held in Rochester, at a date to be announced later, to decide the question of extending the franchise of the Detroit United Railway in the village. At a meeting held a few days ago between the local authorities and Frank W. Brooks, general manager of the D. U. R., the latter is reported to have informed the town that if the company is to make any improvements in the village it must be assured that the present franchise will be extended. The franchise has still seven years to run.

ANN ARBOR BANKERS ENTERTAIN

The spring meeting of Group 9 of the Michigan Bankers' Association met Friday, May 27, at Ann Arbor, where the Ann Arbor bankers are hosts to the delegates from banks in this group, which comprises Jackson, Washtenaw, Lenawee and Monroe counties. Headquarters for the meeting was the Michigan Union, where luncheon was served at 12:30, after which the delegates heard Prof. David Friday. The program was completed by 3:30 to enable delegates to attend the Michigan-Ohio baseball game at Ferry Field.

OFFERS TO SELL TO BAY CITY

Simultaneous with an order from the Michigan Public Utilities Commission requiring the Bay City & Saginaw Railway Company to spend $100,000 for paving on Winona avenue, Bay City, the company notified the city council that unless the competing jitney lines were removed from the streets and certain burdensome conditions in the franchise eliminated, the city could purchase and operate the railway system.

PURCHASE VOTE DEFERRED

The common council of Reed City will not submit to the people a proposition to buy the Osceola Light & Power Company properties for $40,000. A special committee has approved of the appointment of an engineer to look over the property and present a report as to its actual value and what it will be necessary to expend to put the plant in 100 per cent condition.

PUTS IN "AUTOMATIC TELLER"

The Grand Rapids Savings Bank, Grand Rapids, has installed an "Automatic Receiving Teller" at the John D. Rash Company's plant. The teller dispenses 1, 5, 10 and 25-cent stamps which are pasted on folders until $1 or more is accumulated. Then the folder is brought to the bank and a savings account opened. The "teller" is made by the American Banking Machine Corporation, Saginaw.

$50,000 ADDED TO CAPITAL

The Lanz Furniture Company, Allegan, has increased its capitalization from $150,000 to $200,000 and added Weldon Smith, Allegan, and John Travis, Coopersville, to the board of directors, making the total seven.

WEBB, LEE & CO. EXPANSIONS

Webb, Lee & Company, members of the Detroit Stock Exchange, who recently opened offices in Saginaw, Flint and Grand Rapids, has made the following appointments to office managership: L. D. Chapple, formerly with the National Union Bank, Jackson, takes charge of the Jackson office. Harry H. Williams, formerly with Phipps, Benson & Williams, will have charge of the Saginaw office, and Claude Whitney, at one time manager of the F. W. Wagner office at Toledo, will direct activities in the Grand Rapids office. Otto Sherling, formerly with F. W. Wagner's Detroit office, and later connected with the Detroit office of Meeker & Company, will direct the wire service for the entire Webb, Lee & Company organization.

Michigan Bond Items

The Grand Rapids Gas Light Company, Grand Rapids, has been authorized by the Michigan Public Utilities Commission to issue and sell $100,000 of its 5 per cent first mortgage bonds, dated February 1, 1915, and maturing August 1, 1939. The bonds are to be sold at par.

The village of Ford, Wayne county, has turned down the offers of Keane, Hlubie & Company and Matthew Finn, Detroit, to purchase $27,919 of 5 per cent water extension bonds recently authorized. The former's offer was $24,650, and the latter's $24,384. The sale of the bonds will be readvertised.

Hornblower & Weeks and W. A. Harriman & Company have purchased a $2,500,000 issue of 8 per cent fifteen-year bonds of the American Bosch Magneto Company, offered at 98½. The company sold the bonds to obtain working capital and eliminate floating indebtedness.

Reports in Detroit on the $100,000,000 issue of French 30-year external loan 6½ per cent bonds underwritten by a syndicate formed by J. P. Morgan & Company indicate a ready sale of the securities. The bonds are offered at 85 and interest, yielding slightly over 8 per cent. The proceeds of this issue are to be used to retire $70,000,000 in maturing issues formerly sold in the United States and to establish a $20,000,000 credit for American commodities, particularly materials and foodstuffs.

The First National Company and Detroit Trust Company, Detroit, are members of the original Morgan purchasing group.

The city clerk of Sault Ste. Marie will receive sealed proposals for the sale of $100,000 of Sault Ste. Marie refunding water bonds until 2 p. m. June 6. The bonds to bear interest of not more than 6½ per cent.

Dearborn township will receive bids until 8:30 p. m., June 1, for the purchase of $30,000 of bonds for the construction of a concrete arch bridge. The bonds bear 5 per cent interest, are payable semi-annually, $15,000 July 1, 1922, and $15,000 July 1, 1923.

Thirty-five to forty bond houses already have signified their intention of bidding for Lansing bonds, although these will not be opened until July 11. The bonds are $200,000 for paving; $200,000 for bridge and $100,000 for sewer. They were voted at the spring election and the city treasurer is receiving applications.

The Lansing city council this week voted to submit to the people at a special election a proposal to issue $200,000 of bonds for the erection of a memorial building for soldiers of the Civil, Spanish-American and World wars. No date was set for the election.

HARRIS, SMALL & LAWSON'S PLAN

Harris, Small & Lawson, Detroit, are offering the benefits of a copyrighted partial payment plan to small investors who are not in position to pay for bonds in full. Investors who take advantage of this offer may purchase any bond offered by the firm subject to regular conditions from $100 up to $1,000 par value and pay 10 per cent initial payment, the balance to be paid within one year in regular installments. The interest accruing on the bond is credited to the account of the purchaser and the purchaser pays the prevailing rate of interest on unpaid balances. The plan is more fully described in an attractive booklet issued by the firm.

NOTE—Detroit Stock Table omited this week because changes are inconsequential.

$100,000,000

Government of the French Republic

Twenty-Year External Gold Loan 7½% Bonds

Dated June 1, 1921 **Due June 1, 1941**

Not subject to Redemption prior to maturity

Interest payable June 1 and December 1. Principal and interest payable in New York at the office of J. P. Morgan & Co., in United States gold coin of the present standard of weight and fineness, without deduction for any French taxes, present or future.

In the opinion of counsel, these Bonds are a legal investment for Savings Banks in Connecticut, Vermont and California

Coupon Bonds in denominatons of $1,000, $500, and $100, registerable as to priincipal only.

In the Loan Contract under which these Bonds are to be issued, the French Government covenants to pay to J. P. Morgan & Co., during the first five years, as a Sinking Fund, the sum of not less than $9,000,000 in cash per annum, in monthly instalments of not less than $750,000 each, beginning July 1, 1921, such sums to be applied to the purchase of Bonds, if obtainable, at not exceeding par and accrued interest; any unexpended portion of any such instalment remaining in the Sinking Fund at the end of any month to be returned to the French Government.

We are receiving subscriptios nsubject to allotment, for the above Bonds at

95% and Accrued Interest to Yield Over 8%

Subscription books will be opened at the offices of J. P. Morgan & Co., at 10 oo'clock A. M., Wednesday, May 25, 1921, and will be closed in their discretion.

All subscriptions will be received subject to the issue and delivery to us of the Bonds as planned, and to the approval by our counsel of their form and execution. The right is reserved to reject any and all applications, and also, in any event, to award a smaller amount than applied for. Amounts due on allotments will be payable at the office of J. P. Morgan & Co. in New York funds to their order, or on or about June 10, 1921.

Temporary Bonds or Trust Receipts will be delivered pending the preparation of the definite Bonds.

True Cost of Expert Plumbing and Heating

Knowledge and experience are tools of the expert.

Like everything else, the cost of plumbing and heating work is, in the long run, vastly more economical and infinitely more satisfactory when entrusted to experts.

The broad, basic knowledge of plumbing and heating possessed by our organization, has been made more valuable to our clients by a tremendous, diversified practical experience.

Without obligation, we shall be pleased to consult with you at any time, regarding your heating or plumbing problems or plans.

R. L. Spitzley Heating Co.
Heating Contractors Plumbing
DETROIT • 346 Larned Street West • MICHIGAN

THE Michigan Mutual writes more compensation insurance in Michigan than any other two companies combined.

Yes, there is a reason.

Ask for it. A postal will do

Every policy is non-assessable

Every policy shares in savings

Michigan Mutual Liability Company

Real Estate Exchange Building
Detroit Michigan

DETROIT FIDELITY & SURETY.

The Detroit Fidelity & Surety Company is the name of a corporation which succeeds the Detroit Bond & Mortgage Guarantee Company. Capital and surplus is $2,000,000 and the required $200,000 in securities has been placed on deposit with the state treasurer qualifying the new company to engage in business. Present offices are in the Book building. At the reorganization meeting of stockholders held recently the following officers and directors were elected for terms as indicated:

For one year—C. E. Glttins, E. J. Corbett, R. A. Mercier, Maynard D. Follin, all of Detroit; W. H. Burnham, Adrian; Sidney C. McLouth, Marine City; R. Shields, Houghton; Paul Ulrich, Mount Clemens; C. O. Hetchler, Flint.

For two years—Albert E. Sleeper, Bad Axe; Richard G. Lambrecht, Ralph B. Wilkinson, George Reid, F. C. Martindale, F. E. Bushman, Charles J. Esterling, all of Detroit; N. S. Potter, Jackson; Roy Clark, Benton Harbor; Sherman T. Handy, Lansing.

For three years—A. F. Bunting, Walter J. Hayes, Louis W. Schimmel, John A. Russell, E. E. Englehart, all of Detroit; John Q. Rose, Muskegon; Burt D. Cady, Port Huron; Frank H. Ellsworth, Benton Harbor.

The company has purchased from the General Motors Corporation the building at Milwaukee avenue west and Cass avenue formerly occupied by the Hyatt Roller Bearing Company.

Officers of the company are; President, A. F. Bunting; vice-president and agency director, F. H. Ellsworth; secretary, E. E. Englehart; treasurer, W. J. Hayes; auditor, F. C. Michaud; secretary to the president, Frank N. Wakeman.

MICHIGAN CENTRAL ELECTION

Gross earnings of the Michigan Central Railroad Company for the first three months of 1921 were $16,494,476, compared with $20,904,589 for the first three months of 1920. Net operating income, after taxes, was $1,365,810, as against $2,636,681 a year ago.

Michigan Central stockholders, meeting recently in Detroit, elected the following directors: Henry B. Ledyard, E. D. Bronner and Henry M. Campbell, Detroit; Frederick W. Vanderbilt, William Rockefeller, Alfred H. Smith, Chauncey M. Depew, George F. Baker, William K. Vanderbilt, Harold S. Vanderbilt, Edward S. Harkness, Robert S. Lovett and Albert H. Harris, New York.

MAXWELL-CHALMERS ON CHANGE

The Maxwell-Chalmers 8 per cent Class A preferred stock and the Class B common have been admitted to list on the New York stock exchange, when issued.

NEW CEDAR SPRINGS BANK

The Farmers' & Merchants' Bank at Cedar Springs has opened for business. It has a capital and surplus of $30,000 and has more than 80 shareholders. The officers are: President, D. Phelps; vice-president, Thomas J. Blanchard; cashier, Thaddeus B. Taylor. These officers, together with George Arnold, George Munro, James E. Hanna and John M. Holland, constitute the board of directors.

I. C. R. R. EARNS $12.41

Illinois Central Railroad reports net income of $13,571,132 in 1920 after deduction of charges and federal taxes, this being equal to $12.41 a share on the $109,284,467 of capital stock, compared with $11.13 a share in 1919.

D. T. & I. REPORT

The Detroit, Toledo & Ironton Railroad Company reports an operating deficit of $233,385 for the three months ended March 31, as against net operating income of $16,713 for the corresponding period of 1920. Gross earnings were $877,648, as against $1,148,106.

SOO LINE REPORT

Minneapolis, St. Paul & Sault Ste. Marie Railroad Company reports gross earnings of $9,586,872 for the first three months of 1921, as compared with $10,220,705 for the similar part of last year. Net operating deficit, after taxes, was $1,982,666, as against $126,238 in 1920.

STANDARD OIL MEETING JUNE 3

Stockholders of the Standard Oil Company of Indiana, at a meeting June 3, are to vote on a proposal to increase the authorized capital stock from $100,000,000 to $140,000,000. One purpose of the increase is said to be to acquire the remainder of the Midwest Refining Company's stock, about 33 per cent of which is now owned by Standard Oil of Indiana.

World Trade Hurdles to Clear

A Word More About the Handicaps With Which American Manufacturers Burden Themselves

By MARC BRAUN

THE government statistics on American exports during March, recently made public, show a decrease of $450,000,000 as compared with our exports during March, 1920, and a decrease of about $100,000,000 as compared with February, 1921.

It is not the purpose here to discuss the causes for the decline. There are a good many reasons—the exchange situation, for instance, as well as the fact that Europe is beginning to produce more of the things which it has been buying here. However, there is one fact with regard to our foreign trade and that is that too many American manufacturers do not take care of their overseas customers in the same way and with the same spirit as they do for their home trade. This isn't something new; it has been a matter of complaint on the part of foreign buyers of American goods for a great many years.

When the writer was in Belgium and in France during the winter of 1919 in the interests of this publication, he was able to see for himself that the allegations made against American exporters were correct in many instances. At the time one or several articles were written on the subject, but it is not out of place to come back to the subject, now especially, when our foreign business is dropping off.

There was a time when many American business houses made very extensive use of the mimeographed and multigraphed letters to get business in the home markets. The former type of letter is used now only occasionally, and while the multigraphed letter is still used extensively it has been much improved and actually looks more like an individually written letter.

In Europe, so I was told, this sort of letter writing was quite unknown until American business methods brought it out. Some European firms adopted the idea, but only a very small number. As a rule, individual letters were adhered to.

American firms, however, owing to the greatly reduced expense, continued the practice, with the result that much of their mail went into the waste basket. The writer knows of several cases of Belgian and French automobile distributors who had written to American manufacturers for the purpose of obtaining the distribution of their motor cars. Some of the manufacturers acknowledged the receipt of the letters by merely filling out a multigraphed letter form, in which the only thing actually typewritten was the date, the prices and the models. A Belgian dealer who had got one such letter received a "follow up" multigraphed form about thirty days after the first, and in the second letter reference was made to the first one and to the fact that "no answer had as yet been received." Which answer—unless cabled—could not possibly have been received by the American manufacturer; and this he could have found out had he figured the time required for his letter to get to Belgium and for an answer to get to him. Needless to say, the Belgian business man was not very enthusiastic. He did not have much faith in this manufacturer, notwithstanding that his letter head showed the picture of a wonderfully large plant and that he claimed to be one of the biggest producers of cars in the United States.

In Paris a firm of importers was organized to handle American products only. There were two Frenchmen and an American in the partnership. The American naturally corresponded with American exporters. Practically every car from the United States brought a dozen or more multigraphed or mimeographed letters, together with quite a large number of real typewritten letters. The latter were all taken care of with the utmost attention, while the former were given no attention—or at least very little.

Failing to Make an Impression

Undoubtedly many American business men believe that illustrations of their factory and statements as to their large production, or the large number of workers they employ, or the floor space of their factory, is an important factor in the securing of business. In 95 out of 100 cases it does not interest the European prospective buyer in the least, but has rather the effect of making him think that in such big plants and with such tremendous output, the product cannot be made so good, so carefully, so soldidly as in Europe. Nowhere in the old world has quantity production along typical American lines been tried out. Quantity output is not what the European manufacturers instill into the minds of their workers; it is rather quality production.

In a recent issue of Automotive Industries Clyde Jennings relates the experiences of an importer of American cars "over there," from the letters received from the European business man. One letter the writer said: "We started off at the beginning of the year 1920 with a tremendous amount of enthusiasm, but our prospects are marred by the fact that even our first demonstration car did not reach us until June, and finally the first batch of cars for delivery reached us August 13. The situation at this end can be seen by the fact that of the thirty provisional orders for sample cars that we had for dealers, we were only able to get six of them converted into money, the trade view being that the year was dead and gone."

The writer when in Paris was shown copies of cabled orders to American manufacturers, which orders were not filled for more than thirty days, and which arrived nearly sixty days after date. The manufacturer's excuse was that domestic business at the time was taking practically all of his output. True as this might have been, it is most assuredly a poor way to try to build up an export trade. Since that time there has been a great change in the automobile industry in America, and this manufacturer during the latter part of 1920 was very anxious and very willing to take care to the best of his ability of possible foreign business. However, the European dealer did not care then to do business with him. A copy of the letter he wrote several months ago, was handed to the writer: "At a time when I could have sold several of your cars you were in no hurry to take care of my orders, and so I lost some sales. Now when you find that sales in America are diminishing, you are anxious to sell your cars over here. But I do not need them now. I am able to get French and Belgian cars now, without having to wait six months for them, and thus shall not order cars from America. You might, however, take my advice for the future. If you wish to do business in Europe you must take more consideration of the desires of the European dealers."

There is another drawback in our trade expansion methods. We attempt quite often to write to the people of Europe in their language, but instead of writing good French or good Russian or good Greek we employ translators who are not competent. An American truck maker sent out a so-called French letter to Belgian and French automobile dealers during the winter of 1919-1920 which was so faulty and so evidently written by some one who was merely studying French that the letter was circulated among the dealers at one of their weekly meetings and made the topic of an hour's good laughing. The letter even found its way to the office of a high official of the staff of the Minister of Commerce and there also was made the target for jibes.

In summing up the export trade possibilities for America, it may be well to quote again the correspondent of Automotive Industries:

"The export trade is going to need a lot more specialization, much more careful handling and some entirely new treatment along the lines of credit. If your people want to have their full share of export business they have got to get away from this cash against document at the factory or at New York. It means that we importers have the whole of our credit locked up for months at New York waiting for shipment, and it is impossible for the business to expand in the way it should.

"Take my own case as an example. I have had a large credit established at New York now for eight weeks to take care of cars which were due for shipment; the cars have not materialized and, therefore, the credit is not yet used, but as long as the credit is established at New York it is no longer available here, and so other work that might have been done here with the same credit has been standing by. In other words, this means that that portion of my business has been dead for two months.

"If, on the other hand, cars were shipped (of course, only to approved persons with all the necessary safeguards) on the 60 days' sight draft or any other form of credit which might be agreed, I could be going on here here full speed with the other necessary developments and would have ample time, once I knew that the cars had been shipped, to take care of the payment for the shipment when they arrived."

The sooner American exporters begin to think about export trade in the same light as they do about their domestic business, the better it will be for them. We must satisfy the foreign buyer just the same way as we try to satisfy Tom Watkins in Kalamazoo or Charles McGinnis in Owosso. Monsieur Paul Rivaud in Paris or Mr. Emile Robyns in Brussels must be taken care of exactly with the same courtesy and attention as the above mentioned prospective American buyers. For if we don't take care of them they will turn to other foreign markets, where they are likely to be taken care of.

To get foreign business and to keep foreign customers requires special attention and special study. It should not be such a difficult matter for us to make good. We have made good in so many things and we can make good here if we want to. It is merely a case of being less indifferent and careless.

REMINGTON MADE VICE-PRESIDENT

Fred M. Randall, president of the Fred M. Randall Company, advertising agency, Detroit, announces the election of Charles F. Remington as vice-president of the organization.

C. F. REMINGTON

Mr. Remington has been associated with this agency for the last three years as director of research and statistics. He has long been identified with the advertising and publication fields in Chicago and New York and for several years connected with Detroit daily papers. He is a writer of national prominence and has contributed many articles to the press.

COLUMBIA GAS & ELECTRIC

Gross earnings of the Columbia Gas & Electric Company for the year ended April 30, 1921, are reported as $14,894,213, an increase of $1,824,074 over the previous year's earnings. After taxes, rentals and fixed charges, the surplus for dividends was $4,828,677, an increase of $943,544.

SENECA COPPER CO. MEETING

Stockholders of the Seneca Copper Company have been requested to attend a meeting, the date for which has not been set, to vote on an increase in the capital stock from 250,000 to 350,000 shares.

D. U. R. STOCK DIVIDEND

The Michigan Public Utilities Commission has authorized the Detroit United Railway to issue a stock dividend of $375,000, representing money earned, but turned back into the company for betterments and extensions. This dividend represents 2½ per cent on $15,000,000 of the $25,000,000 capital stock actually issued. The dividend will be paid to stockholders of record May 16.

OWENS BOTTLE REPORT

Net earnings of the Owens Bottle Machine Company for the first three months of the current year were $503,189 after deduction of charges and taxes. After providing for a dividend on the preferred stock, a balance equal to 78 cents a share on the common, amounting to $11,037,575, par value $25 a share, was shown.

UTAH COPPER REPORT

The Utah Copper Company reports net loss of $89,828 before allowance for depreciation, but after charging off loss of $395,544 on the sale of government bonds, for the first three months of 1921. In the same period of 1920 the net profit was equal to $1.75 a share on capital stock to the amount of $16,244,900, par value $10.

CITIES SERVICE EARNINGS

Net earnings of the Cities Service Company for April were $1,382,446, a decrease of $735,254 from the report for April, 1920. After allowing for preferred dividends, the balance was $807,930, a decrease of $768,606. Net earnings for the twelve months were $21,578,167, an increase of $1,278,766, the balance after preferred dividends being $14,843,316, an increase of $888,177 over the previous year.

The River Raisin Paper Company, Monroe, has brought suit against the Escanaba Manufacturing Company, Escanaba, for $50,000 for goods claimed to have been delivered the defendant at its own request, but never paid for.

Who's Who In Michigan Finance

Clarence H. Macomber, Banker and Civic Leader at Midland.

THE THUMB of Michigan has produced a goodly number of notable bankers, several of whom have become connected with Detroit institutions and others who have made Detroit their residence. But there is a man up in Midland who has an enviable record of achievement behind him, and a brilliant future. He accumulated wide experience in a short time because he applied efficiency methods to handling bank work from the beginning of his career in 1895, when he entered the Cass City Bank.

C. H. MACOMBER

Clarence H. Macomber is a combination of intense vigor, genial personality and sagacity. And the story of his rise from a beginner in the Cass City bank to president of the Chemical Savings Bank of Midland is a splendid example of what the right sort of young man can do for himself in the banking business.

It happened that C. W. McPhail, owner of the Cass City Bank, was looking for a bank clerk. He applied to the Detroit Business College and was given a number of names of prospective employes with a description of the work each had done and the records made in the schools. From among these he selected Mr. Macomber because of his excellent school record and the recommendations given him by the school officials, and he was hired, as Mr. McPhail says, "at the prodigious salary of $6.50 a week." It was not long thereafter that Mr. McPhail sold out the Cass City Bank to Seeley & Anten, and as a result Mr. Macomber was out of a job. Not for long, however, for he soon became cashier of the American Express Company at Bay City and shortly thereafter was appointed agent of the company at West Bay City. There are some interesting incidents told of how he indulged in economies and extra work in order to get capital together for the bank of his own which some day he hoped to organize.

Eventually the opportunity came. This was about 1898, when he cast his fortunes with Mr. McPhail again. Together they started the Arenac Exchange Bank, of Omer, with Macomber holding down all jobs from janitor to cashier. The chief industry was merchandising forest products and there was but one other bank in Arenac county at the time, at Standish. But both Mr. McPhail and Mr. Macomber had faith in the future of the county and eventually the bank became successful, but, as Mr. McPhail says, "there was quite a period when the little bank didn't earn much more than enough to pay Macomber's board bill."

By 1905 there seemed to be business for a bank at Whittemore, and the Iosco County Bank was established by these two pioneers. Mr. Macomber being the active manager of both institutions. In 1909 they organized a bank at Auburn, which two years later became the Peoples State Savings Bank of Auburn.

Meanwhile McPhail and Macomber bought the controlling interest in the State Bank of Coleman, which made four banks in the string, and Mr. Macomber moved to Midland, from which point he supervised the banks by spending certain days of each week with the different institutions. He had not lived in Midland long before his public mindedness and careful business methods brought to him the mayoralty of the city, which he held for two terms. In 1917, when Midland began to grow rapidly by reason of the success of the Dow Chemical Company, he organized the Chemical State Savings Bank, of which he became president. This bank had a most remarkable growth and within a year after its opening had footings of about three-quarters of a million dollars, passing the million mark within two years.

Midland knew Macomber not only as a good banker and a good mayor but as a successful chairman of the Liberty Loan drives. He was also chairman of the Midland County War Board and director and treasurer of the local American Red Cross. He was born in Calhoun county, Michigan, September 23, 1873, and his hobby, if he has one more prominent than hard earn is swimming, goodly and that April shipment totals were expected to show an increase over those of April, 1920. The plant is operwork, is driving an automobile, of which he is an ardent enthusiast.

A RULING ON TARIFF PROTEST

It happens frequently that importers delay filing promptly protest against government assessment of duty on goods coming from a foreign country. Many importers disregard the fact that such claims or protest must be made within 30 days after the ascertainment and liquidation of the duties, as provided in the tariff law covering customs litigations.

An important decision on the subject upholding the Government has been handed down by the Board of United States General Appraisers in New York affecting the protest which had been filed by a St. Louis, Mo., importer. The board, says the New York Commercial, admits that the contention of the importers for a lower rate of duty than that imposed by the collector was justified, but the protest was overruled on the sole fact that it was not filed within the prescribed time. Duty was assessed on the fabrics in question at the rate of 35 per cent ad valorem, under paragraph 284 of the tariff law. The importers contended for classification under paragraph 283, with duty at the rate of only 30 per cent ad valorem. The importers must pay the higher rate under the board's ruling.

In the course of his ruling Judge Weller wrote: "If the importers were in any way misled through this apparently immaterial error, we can only concinde it was entirely due to their own fault or negligence, for we think they have received all the reasonable notice of the time of liquidation to which they were entitled, and we can find no justification in law for granting the importers in effect an extension of time beyond the statutory limit of thirty days within which to file a protest under paragraph N of Section 3 of said act of 1913."

WESTERN UNION EARNINGS

The Western Union Telegraph Company reports that during the three months ended March 31 its total operating revenue was $25,885,677, as compared with $28,878,725 for the corresponding period in 1920. The net revenue after taxes was $2,761,772, or $1,668,887 less than in 1920.

CALUMET & ARIZONA ELECTION

The Calumet & Arizona Mining Company and the New Cornelia Copper Company, a subsidiary, have elected Gordon R. Campbell president. He was secretary-treasurer and director of the Calumet & Arizona Company.

NEVADA CONSOLIDATED COPPER

For the quarter ended March 31 the Nevada Consolidated Copper Company reports a net loss of $6,634 before depreciation, as compared with a profit of $215,583 for a corresponding period in 1920.

News of the A. I. B.

The annual election was held last Saturday evening at the Hotel Statler and was attended by more than 250 members of the Detroit chapter and their wives. The successful candidates are as follows: President, Frank C. Thomas, First & Old Detroit National Bank; vice-president, Fred D. Lorimer, Dime Savings Bank; secretary, Christopher Montross, Peoples State Bank; treasurer, Arthur Gramm, First State Bank; directors to serve one year, George L. Bott, Merchants National Bank; Kenneth Paton, Detroit Savings Bank; A. A. Chipman, Detroit Trust Company; George Y. Reed, Highland Park State Bank; Julius Rohlfer, First State Bank; directors to serve two years, Grant D. Esterling, First & Old Detroit National Bank; Leo D. Heaphy, Peoples State Bank; Clifford H. Hyett, Dime Savings Bank; George T. Jarvis, Federal Reserve Bank; A. C. Voss, National Bank of Commerce.

CHANGES IN BANK LAW

It is reported by the banking commissioner's office that the only changes in the state banking law resulting from the acts of the legislature which adjourned May 19 are as follows: (1) Terms of commissioner changed from four to two years; (2) the total investment in banking house may now equal one-half of capital and surplus, instead of one-half of capital alone, as heretofore ; (3) directors, officers or employes may vote proxies at annual meetings. This was prohibited by the previous statute.

"COMMON LAW TRUST" PROSECUTIONS

Following the recent decision of the Michigan supreme court that stocks of so-called "common law trusts" come within the range of securities which must be subjected to approval by the Michigan Securities Commission, prosecutions have been instituted against persons selling this unapproved stock in several cities, according to H. N. Duff, executive officer of the commission.

STATE TAX $903,194 LESS

The total direct state tax for the next two years to be levied to meet appropriations made at the regular session of the legislature will be $33,906,028.64, as compared with $34,809,-224.08 for the present two years which end June 30. This means a reduction of $903,-194.44, according to figures just completed by the state administrative board. The total expenditures will be $48,861,431.31, with estimated receipts from all sources at $51,906,-029.64. The total taxes this year total $7,578,654.98, as compared with $6,995,690.96 for 1920. The total valuation of listed companies is fixed at $287,072,650.

MICHIGAN AUTOMOBILE INSURANCE

Stockholders of the Michigan Automobile Insurance Company, Grand Rapids, have elected the following officers: George E. Nichols, president and general counsel; Henry J. Kennedy, vice-president and general manager; Brinton F. Hall and Harlan J. Dudley, vice-presidents, and William M. Ames, secretary-treasurer.

EARTH CONCRETE ELECTION

R. S. Greenwood has been elected president of the Earth Concrete Company, Grand Rapids, in place of Alvah Brown, resigned. Harrison Rich has been named secretary and Abner D. Dilley a director.

CHINO COPPER CO. REPORT

An operating loss of $122,949 for the quarter ended March 31 is reported by the Chino Copper Company During the same period in 1920 the company had a net income of $737,605.

Willmarth & Morman
GRINDERS

Brand New at Special Prices

No. 78 Full Automatic, Wet Power Feed Surface Grinder---$800.
No. 3 Full Automatic, Wet Power Feed Surface Grinder---$800.

These Grinders are Brand New, Late Style, Complete with all Standard Equipment and on our floor for immediate delivery, f. o. b. Detroit, Michigan.

The Above Machines Carry the Factory Guarantee

Riverside Machinery Depot
251 ST. AUBIN AVE. DETROIT, MICHIGAN

PAINT SALES PICKING UP

There has been a gratifying increase in business in the paint industry, according to statements by various representatives of big concerns. Charles S. Kennedy, director of merchants' sales of the Glidden Varnish Company, Cleveland, is quoted as follows: "Reopening of the automobile factories in Detroit already has been felt by the company in a gratifying increase of business along industrial lines. The same may be said about other industries. All indications are that there will be a continued increase.

"Sales to paint dealers during the first quarter this year are in excess of sales made last year, in the matter of dollars and cents, and this notwithstanding that there have been reductions of about twenty-five per cent in price of house paint. Dealers are buying more carefully and placing smaller orders, but the orders are more frequent."

TO MAKE CANE SUGAR

The Marine City plant of the Independent Sugar Company is being overhauled and made ready for a large run. It is expected that within another 30 days a full force or 250 men will be working. The plant will make cane sugar.

MAY MOVE TO HOMER

It is stated by officials of the Homer Chamber of Commerce that if a suitable building is provided the Laughlin Farm Gate & Hinge Company, now in Jackson, will move to Homer. Arrangements have been made whereby the cedar mill of Preston Miller will be offered the Jackson firm.

REHABILITATING BREWERY PLANT

The plant of the Ionia Brewing Company, Ionia, has been leased by Albert Sorg, Grand Rapids; Charles Koeber, Detroit, and John H. Puddnull, Chicago, who are forming a company to manufacture a patent stepladdor invented by Mr. Sorg. Machinery and equipment has been purchased and the company will begin operations with orders for several carloads of ladders on hand.

DALL'S NEW PRODUCT

Another new Lansing product is the all-steel Wolverine express wagon for children, originated and manufactured by the Dall Steel Products Company. Orders already exceed output and will mean an increase in the production of the local plant. The dies and tools are now being built and in 30 or 60 days the wagons will be made in quantity

NEW MANISTIQUE MILL READY

The new sawmill of the Brown Lumber Company, Manistique, construction of which was started in December, 1920, is now completed. The main building is 44 by 140 feet and is known as a line shaft mill. The boiler room is 32 by 50 and the engine room 20 by 40 feet. A number of smaller buildings for diverse purposes will be constructed later. Finished lumber from the mill will be carried from the mill on trucks, pulled by a tractor.

EMPLOYMENT AGENCY REPORTS

According to the state labor department, reports from the twelve free employment bureaus show a steady improvement. During April 2,616 employers offered positions, as against 2,171 in March, with 436 more men and 260 more women offered work.

CONTRACTING PLASTERERS ELECT

At the recent annual meeting of the Contracting Plasterers' Association of Detroit, the following officers were elected for the ensuing year: Walter Fritsch, president; John Shea, vice-president, and Albert Beever, secretary-treasurer.

BITUMINOUS OUTPUT ON INCREASE

Increased bituminous coal output is evidenced in the report of the Department of the Interior for the week ended May 7. The production totald 7,296,000 tons, as compared with 6,970,000 for the previous week and 9,167,000 tons for the corresponding week in 1920. Total output of bituminous for the coal year to date was 136,352,000 tons, compared with 180,171,000 in 1920. In the anthracite mines there was a sharp decline in production, the week of May 7 showing that only 1,633,000 tons were produced, as compared with 1,945,000 for the previous week and 1,891,000 for the similar week in 1920. Yet output for the calendar year to date is ahead of the 1920 production, 31,978,000 tons having been produced, as compared with 30,105,000 for the same period a year ago.

ANGLE STOOL WILL EXPAND

In connection with the announcement that the Angle Steel Stool Company, Otsego, has declared a dividend of five per cent, the Otsego Union reports that the business of the concern is recovering rapidly. The plant is operating six days a week and the expectation is that within the next two or three months operations will tax its capacity, on account of which arrangements are being made to expand the production facilities. The postoffices of Washington and Chicago recently were supplied with steel stools made by the Angle company.

GLOBE KNITTING'S PURCHASE

The Globe Knitting Company, Grand Rapids, has bought an interest in the Robinson & Peckham Company, New York, which for the last fifteen years has been its eastern selling agent. R. W. Jones, president of the New York firm, has been elected a director of the Globe company, while E. A. Clements and Grover C. Good have become members of the board of the Robinson & Peckham company.

Making the Railroads a Closed Shop

(*Continued from Page 4*)

The net operating income was smaller by $454,025,669 in 1920 than in 1919, while the gross operating revenues were $1,041,338,541 larger in 1920 than in 1919. When the roads were returned to private ownership, with them went numerous contracts for materials and supplies at prices fixed by the Government. Out of the charges from which operating revenue was to come, these charges being fixed by the Government, had to be added 97.5 per cent on every dollar for labor, 30 per cent for materials and supplies and 3.5 per cent for expenses other than labor and materials. Of the thirty cents for materials fifteen cents was for materials and supplies contracted for by the Government at prices fixed by it, and the other fifteen cents was contracted for by the roads at prices fixed by market conditions. Therefore for 1920, 97.5 cents of every dollar went for labor, materials and expenses, the costs of which were fixed by the Government during federal control.

Under those conditions all the railroads could do was to seek economies in the consumption of materials and supplies and increased production from labor. The total increase in all expenses of the railroads for 1920 was $1,499,-566,184; the net increase, $1,041,338,210. Fuel cost 27 per cent more; lumber 60 per cent more, and bar, sheet iron and steel, 15 per cent more. Lower costs of all these items is certain this year, which new costs will be possible because of cuts in payrolls as well as in other items of expense, and increased production from the same, or decreased number of employes on the payrolls of manufacturers.

What Louch Did Not Figure

W. Jett Lauck, representing the railroad brotherhoods, filed with the Railroad Labor Board exhibits presuming to show where the roads could save a billion dollars a year by certain economies, particularly those made by the use of more modern equipment. Daniel Willard, president of the Baltimore & Ohio, replied with a statement to the effect that a saving of $10,000,000 a year could be made by modernizing locomotives at a cost of $165,-000,000. Mr. Willard estimated that the Baltimore & Ohio represented about 1/25 of the entire railroad system of the United States. Assuming that the conditions on that system were typical of those on every other, Mr. Willard estimated that an expenditure of twenty-five times that necessary on his system would equip all the railroads to effect a savings of $250,000,000 a year, but the investment necessary to gain this economy would exceed $4,-000,000,000, and he desired to know from what source this sum, or even one-fourth of it, was to be obtained. To provide more modern machinery in the railroad shops, thereby saving $1,250,000 a year, would cost approximately $6,000,000, Mr. Willard said. At one time, he added, the question of whether $2,000,000 should be spent in improving the shops or for providing steel coaches to replace wooden ones came up and it was decided that the comfort and safety of the public called for the purchase of steel coaches more important than the improvement of the shops.

That the railroads have endeavored to effect economies is shown by the following list of methods:

By intensive effort to reduce coal consumption.

By buying coal at prevailing high prices on only a hand-to-mouth basis.

By a sustained nation-wide campaign to reduce loss and damages claims.

By increasing the average movement per car per day.

By increasing the average tonnage per loaded car.

By increasing the average number of cars per train.

By consolidation of operating divisions.

By discontinuation of unprofitable stations.

By discontinuation of unnecessary trains.

By reclamation of scrap materials.

By abstaining from the purchase at present high prices of all but absolutely essential materials and supplies.

By a reduction in the amount of many of these supplies, due to increased efficiency per car and per locomotive.

Inasmuch as wages constitute more than 60 per cent of the cost of operation, not enough saving can be effected in the above fields. Therefore, the roads have been forced, on account of the business depression, to effect reductions in the number of employes. They are seeking by conference with their men a reduction of basic wage rates of necessary employes, to come closer into harmony with wages paid for similar labor in other fields, and to correspond with the reduction of the cost of living since last July.

Why High Rates Fail

Mr. Kruttschnitt's explanation of why the higher rates in 1920 failed to produce sufficient revenue, made before the Senate committee, follows:

"in 1920 the gross revenue of Class I roads was $6,225,000,000, an increase of $1,041,000,000 over 1919, or 20 per cent. The increase was made up as follows:

"1. Increase of 10 per cent in volume of traffic (ton miles plus three times passenger miles).....$469,000,000

U. S. RUBBER'S POSITION

Directors of United States Rubber Company have not recently discussed new financing of any kind, nor do officials think it will become necessary to do so, says the Wall Street Journal. Bank loans which were approximately $50,000,000 at the close of last year have already been somewhat reduced and it is believed that by the end of 1921 they will have been cut in half at least.

Different conditions prevail in the three branches of U. S. Rubber's business. The footwear division is the slowest, although there is an active demand for canvas footwear, such as tennis shoes, keds, etc. Mechanical goods business is somewhat better than it has been and is approaching a satisfactory level. In the tire end, however, there is making a remarkable showing. April sales were on a par with April last year and indications are that May will show substantial improvement.

U. S. Rubber has used up practically all its high priced rubber and is taking advantage of current low prices around sixteen cents a pound to pick up small lots whenever available. In position with respect to cotton fabric is less favorable although sufficiently good to have made possible the recent tire price reduction without any great loss.

Aside from the possible establishment of a few new branch stores, etc., incident to the normal growth of its business, the company contemplates no immediate expansion program of any size. Additions to tire making plants undertaken last year and which are virtually completed will add to tire making capacity. Since Rubber would have no need for additional funds except for new construction on a big scale it appears certain that the company will not enter the money market this year.

MOHAWK MINING REPORT

During 1920 the Mohawk Mining Company's net receipts amounted to $1,627,150, as compared with $2,384,941 in 1919. Net income was $632,762, as against $598,821 in 1919. After deduction of dividends there remained a surplus of $82,762, as against $70,635 in 1919. The feature of the last fiscal year was that work expenses and other operating costs, which in 1919 amounted to $1,850,692, dropped to $1,-046,240.

"2. Increased revenue derived from higher rates on freight and passenger traffic granted by Interstate Commerce Commission, four months.....418,000,000

"3. Increase in mail, express and miscellaneous revenues.....164,000,000

"Thus of a total increase of $1,041,000,000, only $418,000,000, or 40 per cent, was due to the higher rates granted by the Interstate Commerce Commission; the balance, $563,000-000, accruing from greater service performed, excepting only the back mail pay amounting to $64,000,000.

"The increase of $418,000,000 was due to the Interstate Commerce Commission's increases in rates granted on the application of the carriers designed to produce 33.5 per cent increase in freight revenue and 23.9 per cent in passenger revenue.

"These higher rates were in effect for the last four months of the year only; so that the increase in revenue from higher rates fell far short of the requirements of the railroads and amounted to but 8 per cent for the entire year.

"How meager this increase was can be judged from the fact that had the increases designed by the Commission operated for the full year, the increase would have been on the volume of traffic handled $1,202,000,000 more than they actually earned and the increase in gross revenues for 1920 would have been $2,243,000,000, instead of $1,041,000,000.

"From the above will be seen how incorrect is the popular impression that with freight rates fixed so as to increase their gross revenues by 33.5 per cent and passenger fares increase of 23.9 per cent, the managements of the railroads, since their return to private control, must have been improvident and inefficient in the extreme to produce the unsatisfactory results in the calendar year 1920.

State Commission Obstruction

"The increased rates became effective August 26, and although the volume of business during the last four months of 1920 was larger than in the last months of 1919, the actual gross revenue was substantially less than the rates should have yielded, for the following reasons:

"1. The state commissions in many states did not raise the state freight rates the full amount authorized by the Interstate Commerce Commission, so that the full measure of increase was not realized until after the Interstate Commerce Commission issued the necessary orders upon appeal of the carriers. In several states some commodities are still excepted from the increases finally authorized. In Arizona the increases were denied in toto by the state commission, so that no freight rate increase in that state on intrastate traffic was enjoyed by the carriers during the year 1920.

"Many states denied any increase in intrastate passenger fares, and proceedings were necessary before they allowed the higher fares to be put in effect, and as the intrastate passenger business is of almost the same volume as the interstate business, the failure of the carriers to realize the increase of passenger revenue that the Interstate Commerce Commission's decision was expected to produce is easily understood.

"2. Agencies created by the Government and paid for by taxes, in which the railroads themselves contributed largely, operated with constantly increasing effect during 1920 to deprive the steam lines of large amounts of freight traffic which they had created and fostered."

It was not until after the National Association of Manufacturers case was made acquainted with the conditions under which the railroads were operating, and with the evident intention of the Railroad Labor Board to encourage a continuation of such conditions by approving the unionizing of all rail labor, that it took a definite stand against organized labor in the transportation industry and the Railroad Labor Board as at present constituted.

THE PEOPLES STATE BANK

MEMBER FEDERAL RESERVE BANK

Capital, Surplus and Undivided Profits - $14,000,000

For every banking need, this institution has complete facilities; and the standard of service is particularly high.

The past year has emphasized the desirability of a banking connection of this type.

OFFICERS

JAMES T. KEENA, Chairman of the Board
JOHN W. STALEY, President
F. A. SCHULTE, Vice-President

MICHIGAN MUTUAL LIABILITY

F. C. Whitney, Muskegon, secretary of the Motor Specialties Company, who retired as president of the Michigan Manufacturers' Association this year, was elected a director of the Michigan Mutual Liability Company, Detroit, at the annual meeting. The retiring directors were re-elected as follows: F. S. Bigler, Wilson Critzen, C. W. Dickerson, Frederick T. DuCharme, F. W. Hutchings, James Inglis, A. F. Jackson, A. J. Peoples, F. C. Root, J. R. Searles, Hal H. Smith, A. A. Tompkins, all of Detroit; Fred Buck, Saginaw; P. W. A. Fitzsimmons, Tecumseh; Lisle Hall, F. C. Ruch Lansing; E. A. Weves, Grand Rapids; William A. Yawter II, Benton Harbor; A. B. Williams, Battle Creek; C. F. Zapf, Traverse City. The stockholders held the meeting in Hotel Statler, where dinner was served in the evening. In the meeting room the company arranged an exhibit of photographs showing progress in accident prevention work and during the afternoon motion pictures on the same subject were presented.

CREDIT MEN'S CONVENTION PLANS

Members of the Detroit Association of Credit Men who will attend the annual convention of the National Association of Credit Men, San Francisco, in June, will leave Detroit on the "Indianapolis Special" at 10 p. m., June 3, on the Michigan Central. On this train will be the delegations from St. Louis, Pittsburgh, Cincinnati, New Orleans and Cleveland.

GORMAN ON CORPORATION TAX

Frank E. Gorman, state treasurer, reports that the new corporation tax law of three-tenths of a mill on capital stock and surplus is being well received. He quotes executives of a number of corporations as saying they do not believe the tax will be burdensome and the the collection of the $6,000,000 sought will be difficult. Mr. Gorman says these men feel it is far better than a state income tax.

HUBBARD HEADS NEVADA COMPANY

Two men well known in Michigan's sugar industry—B. C. Hubbard and Charles Cave, both of St. Louis—have been elected respectively president and treasurer of the Lahontan Valley Sugar Company, Fallon, Nev. The plant has a capacity of 600 tons of beets a day.

BELDING BOARD ELECTS

The Belding Board of Commerce has elected the following officers: President, E. C. Lloyd; vice-president, Clyde A. Knapp; treasurer, Merton Smith. Directors, Walter Ireland, Henry J. Leonard and W. P. Hetherington.

PORTLAND SEEKS NEW INDUSTRIES

The Portland, Mich., Board of Commerce announces that negotiations are pending to bring a garment industry and a brick plant to the city. The following have been elected directors of the board: Carl D. Bywater, Ross H. Collier, Carl O. Daby, Peter H. Knox, Lorenzo Webber, Will J. McClelland, Will C. Stone, O. E. Robbinson, A. A. Mack and E. A. Richards. It was decided to hold an old-fashioned business men's and farmers' picnic August 10.

HANDS SUCCEEDS ELLSWORTH

L. T. Hands has been appointed state insurance commissioner by Gov. Groesbeck to succeed Frank H. Ellsworth, who resigned to become vice-president and superintendent of agencies of the Michigan Bonding & Mortgage company, Detroit. Mr. Hands, who comes from Sanilac county, has been in state service for some years, having been first deputy in the insurance office since the death of Don A. Baxter a year ago.

DELIVER TO SINK NEW SHAFT

The Oliver Iron Mining Company, which recently obtained an extension of the lease of the Geneva property in Beaver township, Gogebic county, will begin shortly the sinking of one of the largest shafts ever constructed for the production of iron ore, says the Iron Wood Times. The new mine will be located midway between the Davis and the Puritan properties of the company. The shaft will be designed to develop further the iron ore coming into the Geneva territory from the west, from the Norrie and Newport properties.

TWO URGE REFORESTATION

George L. Lusk, of the public domain commission and conservation department, in an address to the Lansing Engineers' Club, last week, urged the importance of a program of reforestation. He declared there were thousands of acres in Michigan which were good for little else. Richard A. Smith, state geologist, also emphasized the possibilities of profit to the state and industry through reforestation.

Books Containing Facts On Operation of Trucks

On request of the National Team & Motor Truck Owners' Association, whose headquarters are in Detroit, the Detroit Public Library has compiled the following list of references on motor truck operation:

Short Course for Motor Truck Operators, by H. P. Gould. Engineering and Contracting, v. 52, pp. 231-232, Aug. 20, 1919.

Classified Table of Truck Load Capacities. Horseless Age, v. 33, p. 349, Nov. 15, 1916.

Curbing Waste in Motor Trucking. Iron Trade Review, v. 32, pp. 973-978, Apr. 13, 1916.

Design of Passenger Automobiles, by C. M. McCreery. Society of Automotive Engineers Journal, v. 3, pp. 37-38, February, 1920.

Efficiency in Motor Truck Scheduling Age, v. 43, pp. 48-49, February, 1921.

Getting the Co-operation of the Man Who Drives Your Truck. Factory, v. 20, pp. 242-244, February, 1918.

Load Scale for Trucks. Municipal Engineering, v. 51, p. 204, November, 1916.

Making the Motor Truck Better. Factory, v. 24, pp. 872, 1173; v. 25, pp. 276, 766, 1156, 1354, Mar. 1-Apr. 15, May 15, Sept. 1, Nov. 15, 1918.

The Modern Motor Truck Design, Construction, Operation, Repair and Management. Directions, by V. W. Page. 1921. "Considers in detail everything one needs to know about motor trucks, their care, operation and economical use. Includes full instructions in non-technical language, for the guidance of leading makes of trucks and making necessary repairs. Illustrated by specially drawn engravings."

Motor Truck and Automobile Motors and Mechanism; a practical illustrated treatise on the power plants and parts of gasoline motor vehicles, by T. H. Russell. 1917.

Motor Truck Cost Data for Use in Business Profits, by S. V. Norton. 1918. One of the most complete books on motor trucks, containing accurate, tested information on all essential features. Phases are grouped under five main parts:

Part 1. Fitting the motor truck to your business.

Part 2. Making your motor truck do more and better work.

Chapters on body design, methods and time of loading under this head. The other three parts discuss cost accounting, building new business and future problems.

The text has 225 illustrations, and many performance charts.

Motor Trucks: Design and Construction, by C. T. Schaefer. 1913. The book aims to give in simple language, a practical discussion of the gasoline commercial truck. The general mechanical layout of the chassis is followed by chapters devoted to the construction details of the engine, cooling systems, etc. The illustrations number 192, consisting largely of photographs and text.

Motor Truck Efficiency as Related to Solid and Pneumatic Tires. India Rubber World, v. 60, pp. 561-567, August, 1919.

Motor Truck Operation and Accounting. Municipal and County Engineering, v. 58, Supp. 18, v. 59; Sup. 18, Sup. 10, Sup. 10, Sup. 10; v. 60, Sup. 14, January, March-December, 1920, February, 1921.

Motor Vehicle Engineering, Engines (for Automobiles, Trucks and Tractors), by Ethelbert Favary. 1918. Presents in a concise way information needed by the designer and engineer as well as the draft-man. Includes many dimensional details and drawings.

Motor Vehicles on Their Engines; a practical handbook on the care, repair and management of motor trucks and automobiles, for owners, chauffeurs, garagemen and schools, by E. S. Faser and R. B. Jones. 1919. "Authors have collected in a small compass such elementary, theoretical and practical information as will assist in the operation, upkeep and adjustment of motor vehicles."

Power Wagon Reference Book. 1920. The motor truck, tractor and passenger car, are treated in separate sections. The use of the motor truck in different industries is a special feature of the book. There is good material on truck body design, including blue print drawings. Tabulated specifications for motor trucks and tractors are listed.

A Study of Road Impact and Spring and Tire Deflection, by A. F. Masury (an account of tests made).

Society of Automotive Engineers Journal, v. 7, pp. 96-102, July, 1920.

Practical Considerations as a Motor Truck Delivery Wagon on Different Roads, by E. A. Kennelly and C. D. Asbury. (Massachusetts Institute of Technology, Electrical Engineering Department, Research Division Bulletin No. 10, pp. 101-1039. June, 1914.)

Truck Efficiency Graphically Shown, by F. W. Ives. Automotive Industries, v. 38, pp. 33-36, Jan. 3, 1918.

What Truck Service Should Be and How It Should Be Rendered. Motor Age, v. 37, pp. 91,92, January 29, 1920.

There Also Recent Instruction Books on the Operation of Different Makes of Trucks as Peerless, Packard, etc.

Maintenance and Inspection

Constant Inflation Means Long Tire Life. Automobile, v. 35, pp. 28, 29, July 3, 1916.

How to Get the Most Out of a Motor Truck, by V. W. Page. Scientific American, v. 121, p. 634, Dec. 27, 1919.

Importance of Systematic Inspection and Maintenance of Motor Trucks. Scientific American, v. 116, p. 498, May, 1917.

Maintenance of Motor Tires. Machinery, v. 26, pp. 42-44. September, 1919.

Overloading and Misuse of Trucks Automobile, v. 35, pp. 1070-1071, Dec. 21, 1916.

Relation of Solid and Pneumatic Tires to Motor-Truck Efficiency, by Ethelbert Favary. Society of Automotive Engineers Journal, v. 3, pp. 203-4, April, 1918.

Supervision, Lubrication, Maintenance of Motor Trucks. National Petroleum News, v. 12, pp. 51-52, Oct. 6, 1920.

Trends in Management—How the Motor Truck is Developing Ideas that Lead to Better Management. Factory, v. 25, pp. 708-709, Sept. 1, 1920.

What Constitutes Good Care of a Motor Truck. Factory, v. 20, p. 704, April, 1918.

Cost Accounting

A Six-form System of Keeping Track of Truck Work. Engineering and Contracting, v. 53, pp. 61-64, Jan. 7, 1920.

A Checking System of Upkeep for Automobiles and Trucks, by R. C. Rognon. 1913.

Cost and Operating Data of Motor Truck Service. Railway Review, v. 63, pp. 806-810, Dec. 7, 1918.

Cost Systems Adapted to Make Motor Trucks Economic Engineering, v. 57, pp. 104-105, Apr. 19, 1912.

Motor Transportation and Its Value to Industry. Engineering Magazine, v. 44, pp. 626-646, 732-750, 851-866, January-March, 1913. (Deals fully with cost accounting.)

Standard System for Motor Truck Operating Costs. Engineering and Contracting, and Contracting, v. 49, Sup. 24, Sup. 23, Feb. 6, June 19, 1918.

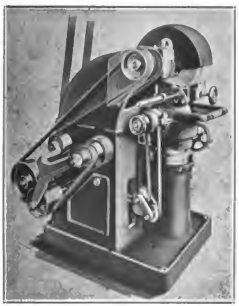
RED CROWN GASOLINE EVERYWHERE

Every few miles in the country---and every few blocks in the city---you can get Red Crown Gasoline. That's your assurance of uniform power when you use Red Crown---for it never varies.

Its uniformity is guaranteed---its performance is assured. It's the best motor gasoline you can buy regardless of price.

That steady steam-engine-like piston stroke imparted by Red Crown means long life to your motor.



No racked engine causing frequent overhauling. No delay from lack of power. For the utmost in gasoline service, use---

RED CROWN

Standard Oil Company (Indiana) Chicago, U. S. A.

Pageant of Progress Exposition at Chicago's $5,000,000 Municipal Pier, July 30 to August 14

Mr. Automotive Parts Manufacturer:--

Did You Get That Order You Figured On?

Maybe this is your predicament.

The other day a local parts manufacturer called on the Purchasing Agent of ——— Motor Company.
He wanted to quote on wrist pins, oil pump plungers, cam rollers and pins, etc.

Says the P. A.: "Have you got a Detroit Centerless Grinder?"

"No. Why?" said the Parts Manager.

Here is what the Purchasing Agent said:
"You can't compete with others unless you grind by the Centerless Method, and you better buy one of the machines."

AND WHY NOT?

Piston Pins, 1 1-16" dia. x 3½ long—125 per hr.
Piston Pins, ¾" dia. x 2¾ long—200 per hr.

Studebaker and Its Men

(Continued from Page 6)

will then be given the option of purchasing the property at the stipulated price. In the event of purchase he will be given a credit by the company for continuous service equal to 3½ per cent of the sales price, as well as credit for the excess of monthly payments over interest, tax and insurance charges.

At any time after five years and before ten years the purchaser may leave the employ of the company and yet hold the property under the terms of the agreement, except that he will be charged interest at the rate of 7 per cent and his monthly payments be increased to 1 per cent of the unpaid balance at the time of his leaving the company. At any time after the fifth year any purchaser may pay up the unpaid balance and receive a deed to the property. Down payments in excess of the stipulated amount will be accepted and will serve to decrease interest, but in no case will a deed be given to the property before the expiration of the specific lease period.

It is expected that the outstanding balance will be cleaned up at the expiration of ten years either by the payment of cash or the execution of a note or mortgage.

The special privilege in connection with these homes is of course given only in exchange for continuous service and is intended to be another thorn in the side of the company's labor turnover.

The first allotment of homes now being offered the employes is the subject for much discussion and it is expected that the interest will continue to grow as the plan of sale becomes more familiar.

Carrying out the system roughly sketched in the foregoing paragraphs involves the expenditure of a great deal of money. Much of the amount paid out in this way during the last year and a half will come back, eventually, in the form of payments on the homes constructed. How much return is had from the co-operative work proper is not known. It doesn't come back in the form of dollars and cents. The question is frequently asked, Does it pay? The queries are for a dollars and cents statement—which it is impossible to give.

There is no way of getting it down on paper. Even if it were possible, which it isn't, to know the value in connection with the reduction of labor turnover, there would yet be a lot of unknown quantities to consider. For instance, there is no way of estimating the value to be had from giving a factory worker a week's vacation with pay. Granted that it puts new life and vigor into him, you can't say how much and how it affects production.

The Studebaker Corporation knows for a reasonable surety that if employees feel a greater interest in its concern when they hold some of its stock, but it doesn't know how to measure this interest in the form of increased and more excellent production. It may, and does, know of instances where the anniversary check provision has kept men on the job in the face of difficulties, but it doesn't know what this provision is worth in dollars and cents.

The whole thing must be viewed from a broad standpoint and largely on general principles. Accurate reports of labor turnover are kept and the rise and decline tabulated monthly. During 1920 the company's turnover was 269.9 per cent for the year; on a yearly basis, it was 61.6 per cent for the first three months of 1921. That is an extraordinary reduction, but just how much of it is due to the co-operative work it is impossible to say. The company attributes much of it to this work but there are undoubtedly many other contributing factors. The general industrial conditions over the country would surely have to be given credit for no small part of the reduction. But granting all this, it is yet believed that the co-operative work has contributed much toward the reduction—so much that the board of directors has seen fit to continue the complete system throughout this year.

Probably the most concrete and tangible result came about in the Detroit plants early this year. Body painters and trimmers employed there refused to join a strike of their union in that city, giving as a reason that they were unwilling to sacrifice their co-operative benefits for the probable gain to be had from the strike.

Interested persons frequently inquire as to the personnel necessary to the carrying on of such a work. Studebaker's work is charged to a special organization known as the Co-Operative Department. To this department falls all record keeping as to punctuality and attendance, as well as the supervising and training of factory workers. The hospital work, sanitation provisions and recreation facilities and management are likewise listed as a part of this department's charges.

Dr. C. A. Lippincott, a Presbyterian minister, is head of this department, and under him work the several heads of the departmental divisions. A number of men known as factory representatives work in the plant with the men and keep attendance records as well as handle any matter which must be taken up through the Co-Operative Department.

The department is entirely on a business basis and keeps as far away from any savor of welfare work as possible.

Punch and Power Press Operation

(Continued from Page 9)

While it is not the only press used for extruding metals, still it is the most important. With it lead and brass pipe are made. Pad lock hasps, gears, brackets and many curious shapes of many metals that could not otherwise be made except at great expense are extruded. Lead, tin, copper and brass are the principal ones. The solder are placed in the machine cold and are extruded without the addition of heat. Copper and the brasses are usually heated red hot before being extruded. The operation given very fine, strong tough metal, the characteristics being far ahead of similar metals cast or worked up in other ways.

An important field in this line is the covering of cables with lead for protection against the elements. The rods from which the shrapnel balls were made were the product of extrusion presses. Wire solder, thin tubing, the lead support for stained glass and many other shapes are regularly made in this manner.

Extending the field of the power press must be done by the new industries involved. It is safe to say that the ordinary metal manufacturing industries have a fair working knowledge of what is possible, although there are still many parts that could be made for a small fraction of their present cost on stampings. In many cases it will be necessary to re-design the part somewhat but this can usually be done without injury.

That has been the history of the automobile. One part after another has been made of a stamping, until today if it were necessary to go back to the old method of manufacture, the average weight of the machine would be increased by hundreds of pounds, and the cost hundreds of dollars. A study of the various pieces will show unsuspected possibilities for other industries.

All it needs is a suspicion that it is possible to substitute a stamping. Send a print or

AMERICANIZATION PROGRESS

Co-operation between the Y. M. C. A., the Grand Rapids Americanization Society and the local board of education is reported to have given excellent result in the Americanization work going on in the Furniture City. The report of it. M. DeWitt, of the Y. M. C. A. shows that of thirty-six plants where the Association has been conducting its educational campaign since the beginning of the year, all but three are now on a 100 per cent American basis. And even in these three plants there are less than half a dozen aliens. Since January 100 aliens have taken out their first citizenship papers.

MAKING A BOTTLE CONTAINER

The Davis Metal Fixture Company, Lansing, has originated and is manufacturing a novel container for milk bottles, which can be attached to the side of the house where it cannot be upset by children, animals or wind. On the face of it are movable hands to indicate the amount of milk desired. The container is constructed of metal and finished in black enamel. It has been indorsed by the state board of health and M. A. C. Dairy department. The container will be manufactured in quantity lots and put out through jobbers.

the article, explaining just where and how it is used and what strains it must stand and the number exactly alike that are used, to one of the machine manufacturers of presses. They will advise whether it is possible to make it on a power press. If by changing the design somewhat it can be made a practical operation they will let you know. They will tell you on what press it must be made, the production per day, the kind of dies that must be made, and their approximate cost.

Very few if any press manufacturers also make parts but they all know factories which can handle exactly that job to the best advantage, and will tell you about them.

The production of a press or a series of presses is so great that unless there is a very large demand for the parts it is not economical to make them yourself. There is a possibility of a greater reliability and control in your own factory but unless there is a sufficient number of presses at work the cost of die up-keep, superintendence and idle time of the machines will more than equal the cost of the purchased parts. Added to this is the increased overhead due to larger factory, capital tied up in machines, and press depreciation.

There are a large number of companies which specialize on making certain types of dies. The press builders usually will build your dies for you if you wish. This removes the difficulty of making and designing them but not of caring for them. Dies must be cared for very rigorously or they will not give a good product.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

A Basis for Motor Price Cuts

Detroit Manufacturer Suggests Informing the Public Fully As to Costs, in Order to Restore Confidence

By ALFRED FISCHER

UNCERTAINTY is the greatest destroyer of business and all that goes into business. No matter how bad a situation is, once it is known that it is at bed rock, those responsible for its rehabilitation take off their coats, roll up their sleeves and start to clear away the wreckage.

When a principle is fundamental it is no matter whether it applies in automobile production, farming or chasing butterflies. Therefore the ruthlessness of uncertainty as a destroyer of that which better days and more confidence created must be expected to function.

The automotive industry today is torn by the element of uncertainty, created for the most part from within its own ranks. Prices are tobogganing; and, like a tobogan, one is never certain where he is to be landed. He might stop after the force of velocity has spent itself, at the base of the iced inclined plane, or he might be tipped over by the wind and land on his ear in a snowbank, or a pebble in the path might spill him hopelessly in the way of other sleds close behind.

Price Cuts Fail As Stimulus

In the mad scramble for automobile orders, in this period of paucity, there has been almost a condition of panic. Manufacturers, convinced that the public was holding out for lower prices, cut into their retail prices deeply in all cases. Of course materials and labor were lower and general conditions permitted the change in selling prices. However, the public has not bought.

One Detroit manufacturer of parts, whose books contain the names of the best known manufacturers of automobiles, has come forward with a possible answer to the continued stagnation. It is simple enough, but unrecognizable because, like so many simple things, the fundamental principle luvolved has been overlooked.

"The trouble has been that price cutting, instead of restoring confidence of the public, has served to unsettle it further," is this manufacturer's analysis. "Here is how it has worked:

"The average prospect for a car of any class or size reads how steel and leather and labor are coming down in price. He expects that there will be some reduction in automobile prices, just how much he has no way of knowing. He waits for developments.

"When the price cuts come he discovers that they range from $200 to $500 on cars of the same class, with the same weight and about the same amount of material in their construction, built in the same labor market. He looks over the reductions in cars of higher grade and discovers blanket reductions in excess of $1,000. Is he tickled to death and does he run right to the bank to withdraw his savings and purchase a car? He does not.

"Instead he starts to wonder, and his wondering makes him ask a lot of questions. Is this the end? Will there be another cut when the model for the coming year is put on the market? Will there be a further cut in steel, lumber, labor, etc.? Are they cutting too deeply and taking it out in quality of the vehicle so that my car will have to be junked in eight months? Are they using seconds instead of firsts when they put on tires? If they can knock off $1,400 overnight on a six or eight-cylinder car, aren't they holding back another $1,400 profit? Guess I'll sit still a little longer.

"Do you consider that extreme? Then ask the first ten men you meet who are financially able to buy a car but have not done so, and hear what they say. Their stories will have a most uninteresting uniformity."

What is the remedy, if there is one? This manufacturer believes that there is not only a remedy but that there should never have been an ailment. What about the National Automobile Chamber of Commerce, he asked? Where was it all this time? When prices are changed, he believes, the manufacturers owe it to the public to explain why they are increased or lowered. He urges that this be done so that the situation may be clarified before there is further destruction and before uncertainty takes a greater toll.

It is suggested that the N. A. C. C. or some other responsible group make a study of production and sales figures, estimate the average cost of building cars in the various classes, figuring everything that enters into the business, and publish such tabulations as a basis for making price cuts. It would serve to give both uniformity and standardization to the revision, whichever way it would have to go, for once established, such a system would be continued.

The suggestion is to estimate costs on a weight basis. Figures based on markets as they fluctuate from time to time could be assembled showing the costs of the various materials, and striking from those figures what should be the cost of building a car of any given weight. For the items of overhead it will be found that sales, advertising, cost of maintaining dealers, promotion, depreciation, reserve and other figures would not be difficult to reach averages upon, so that it would soon be possible to state just what a light four-cylindered car should bring; likewise a six or eight-cylinder, open or closed body, etc. Then the elements that make up prices could be understood by the prospective purchasers and there would be some definite understandings as to what could be expected.

Costs About Stabilized

It is a matter of figures that prices of most commodities at present are just about at the average of the last sixteen years, so that there can be no more serious fluctuation, unless a panic should utterly demoralize the markets for certain basic products. But our wisest economists and financial men tell us that the pendulum has begun to swing upward and that the worst is over.

What would be the effect of such a clearing house of definite and confidence-restoring information to the country on the financial interests? Is it not reasonable to assume that it would tend to make money easier for the automotive industry, for manufacturer, dealer and purchaser alike? Such a conclusion is almost trite. It should be done by the industry itself for its own best interests before some outside regulatory force decides to undertake the task. For once that is attempted, the compilations would not be made disinterestedly by those best qualified.

The automotive industry will weather any storm because it is too firmly imbedded in our life. How soon it will reach port depends upon its pilots.

Buick, Chalmers, Sheridan And Mitchell Cut Prices

During the last ten days the price reduction wave among the automobile manufacturers has been more pronounced than at any time since Jordan started the movement nearly four weeks ago. The Mitchell Motors Company, Inc., Racine, Wis., reduced its prices from $160 to $260 on the model, as follows:

Model	New Prices.	Old Prices.	Reduction.
Three-pass. roadster	$1,490	$1,750	$260
Five-pass. touring	1,490	1,750	260
Four-pass special	1,790	1,950	160
Four-pass. coupe	2,590	2,800	210
Five-pass. sedan	2,690	2,900	210
Seven-pass. touring	1,995	1,995	none

The Chalmers Mtor Car Company, Detroit, cut prices from $150 to $300, according to the body type. The new schedule, as compared with the old one, is as follows:

Model	New Prices.	Old Prices.	Reduction.
Roadster	$1,495	$1,795	$300
Five-pass. touring	1,545	1,795	250
Seven-pass. touring	1,795	1,945	150
Coupe	2,195	2,595	200
Sedan	2,445	2,745	300
Sport	1,695	1,895	200

The Sheridan Motor Car Company, Muncie, Ind., which is one of the General Motors Corporation units, but is about to pass to Durant control, announces the following revision:

Model	New Prices.	Old Prices.	Reduction.
Two-pass. roadster	$1,485	$1,685	$200
Five-pass. touring	1,485	1,685	200
Four-pass. coupe	2,265	2,565	300
Five-pass. sedan	2,465	2,765	300

The Buick Motor Company, Flint, which is the largest producer of cars in the General Motors Corporation group, announces that the

"Pittsburgh Plus" Again

Dispute About Fairness of Long Established Base On Steel Once More Before the Trade Commission

LATEST ADVICES from the Federal Trade Commission indicates that "Pittsburgh plus" is "in Dutch" again. Manufacturers of products fabricated from rolled steel, who are seeking every avenue leading to possible reductions in the cost of production to facilitate the readjustment of business, have prevailed upon the Commission to make an investigation of the steel industry to ascertain if a continuation of the practice of basing all steel upon Pittsburgh regardless of actual source of supply, is justified.

In 1919 "Pittsburgh plus" was on the carpet to face charges of being an "unearned increment," brought by the Western Association of Rolled Steel Consumers, aided by a southern association of the same name. After a week's hearing the Commission, by a vote of three to one, gave "Pittsburgh plus" an immunity bath. Since then the National Association of Purchasing Agents, the American Farm Bureau, the Mississippi Valley Association and numerous other organizations interested in steel have joined the pioneer agitators and their combined efforts have influenced the Commission to admit a bill of complaint and investigate.

What "Pittsburgh Plus" Is

"Pittsburgh plus" is a twenty-year-old practice of charging the freight rate on steel from Pittsburgh to destination regardless of the actual source of supply. Manufacturers of steel in the Middle West are the main opponents of this practice. Michigan is affected because it uses an enormous amount of rolled steel in the manufacture of automotive products.

The average passenger car contains about 913 pounds of steel. The average for motor trucks is 1,370 pounds. There are 54 passenger car and truck plants in Michigan manufacturing normally more than a million cars and trucks a year, to say nothing of the tractors, automotive parts and accessories that Michigan manufacturers buy their steel wherever they can get it the cheapest; consequently not more than half of the supply comes from the Pittsburgh district. Ever since the automotive industry in Michigan became not only the state's leading industry but established the state as the automotive center of the world, Detroit has been "threatened" with steel industry of its own. In fact, manufacturers believe that within two years Michigan will have one or more steel plants of great capacity to supply the automotive industry.

When Pittsburgh became the steel center of this country mills located elsewhere looked to Pittsburgh for the price standard, and the practice of basing all prices on Pittsburgh—that is, using the Pittsburgh freight rate—was established. Gradually mills have been located in Sharon, Pa., Gary, Ind., Youngstown, O., Warren, O., Chicago, Ill., Duluth, Minn., and Birmingham, Ala. The freight rates from any of these centers to consumers within their immediate territory would not be the same as that from Pittsburgh to these consuming districts. Until these mills began to produce steel in large quantities there was no objection to the Pittsburgh base. Now that there are indications that Pittsburgh may lose its primacy, consumers close to other steel centers want the Pittsburgh base eliminated so far as they are concerned.

If, for instance, a steel plant was established in Detroit and was adequate to supply steel to the automotive industry, consumers in Michigan would want the price based upon Detroit rather than upon Pittsburgh. It is claimed that if "Pittsburgh plus" continued in effect the consumer in Michigan who either hauled his steel by motor truck to his plant, or had the advantage of a short haul by railroad, would have to pay the differential between the Pittsburgh freight rate to Detroit and the actual freight rate from the Detroit plant to his plant.

Frank Emerich, in an article in the Mississippi Valley Magazine, claims that the "Pittsburgh plus" practice results in an annual charge against steel consumers of $75,000,000, which represents freight rates charged into the price of steel, but which is not earned by nor paid to the railroads. He declares that a Chicago consumer buying steel in South Chicago or Gary, Ind., has to pay $7.50 a ton freight rate from Pittsburgh even though he may haul the steel to his plant in his own trucks.

Walter V. Heimel, purchasing agent at the Motor Products Corporation plant, Detroit, and who buys approximately 25,000 tons of steel annually, says that at this time when cost reduction is the main thought in industry, "Pittsburgh plus" assumes an entirely new importance.

"In the future," says Mr. Heimel, "the aim of industry will be to buy everything at the lowest possible cost and get the lowest possible freight rates on materials shipped to the plants as well as on finished products shipped from the plants. Therefore every extra item will be challenged.

"'Pittsburgh plus' has long been regarded as an uneconomic practice by those consumers of steel who buy from plants located outside of Pittsburgh. At this time, perhaps, it is not so important for the reason that competition for business is so keen among the steel manufacturers that the prices quoted have little in common with each other and the very favorable quotations render the 'Pittsburgh plus' negligible. If Detroit has a steel plant in the near future—and I am sure it will—we cannot afford to have the 'Pittsburgh plus' handicap.

"On the other hand, I am buying steel from five different plants, only two of which are located in Pittsburgh. If I could not get the most favorable prices the Pittsburgh base would be a greater burden than it is. When Pittsburgh was the undisputed center of steel production there was no reason for objecting to that city as a basing point, but it is a hardship on buyers of steel to have to pay the Pittsburgh differential when buying steel from plants closer to destination."

The 1920 Detroit consumption of sheet steel was 106,220 tons, more than half of which came from plants outside of Pittsburgh. Ford used 30,000 tons and the rest was taken up by automotive plants in general. The rate from Pittsburgh now is 32½ cents for 100 pounds, carload or less. From Warren, O., the freight rate is 23½ cents, carload lots. The Pittsburgh freight rate prevails, hence there is an extra charge on every 100 pounds, or 60 cents on the ton. Assuming that only half of the steel consumed comes from outside the Pittsburgh district, the amount of excess charges paid by steel buyers would be $30,000 for the year. The strip steel consumption is about 200,000 tons, and the unnecessary charge to consumers of this product is claimed to be $720,000 year, assuming that only half of it comes from plants closer to Michigan than Pittsburgh.

Harry Botsford, of the National Association of Purchasing Agents, has written an article on this subject, in which he says:

"The necessity of establishing Chicago and other steel producing centers as price basing points is manifest, and this fact is brought home with striking force when it is taken into consideration that 10,000,000 tons of steel are sold in Chicago annually, which, on the present Pittsburg basing point of $7.60 a ton added freight, means over $50,000,000 annually, the greater portion of which might be saved to the western consumers. Gary mills produce steel approximately 18 per cent cheaper than Pittsburgh, and Pittsburgh holds a handicap of about 9 per cent over the Chicago market under the present basing practice."

The above facts are only a small part of the arguments before the Federal Trade Commission. The fact that the railroads do not recognize the "Pittsburgh plus" in buying steel rails because they haul the rails and pay no freight rates they do not charge themselves, is cited. The question of why there should be a Pittsburgh base on rolled steel when there is no base on pig iron also is asked.

What the Producers Say

At the 1919 hearing before the Federal Trade Commission the mills won their case on the ground that the Pittsburgh base was an economic necessity, because inasmuch as Pittsburgh produced 40 per cent of all the steel used in the country it took up the slack and was entitled to a better price. It was declared that if the Pittsburgh base were removed the price of steel charged by other plants would be higher than the Pittsburgh quotation for the reason that other mills would charge the Pittsburgh price in the same markets. Abolition of the Pittsburgh base, it has been contended by the mills, would mean that many of them would have to move their plants into western and southern territories or build new plants in those districts. Millions of dollars have been invested in the steel business in Pittsburgh and naturally every effort will be made to maintain Pittsburgh as the steel center of the country.

Under present conditions the eastern steel manufacturer can sell his product in competition with the western manufacturer, while the steel man in the West can sell in the East only at a disadvantage. The same rule applies in the South. Therefore, it can be seen why the establishment of new steel plants in the West or South will not be of any advantage so long as Pittsburgh remains the basing point. The Mississippi Valley Association is laboring diligently to build up industry in the valley, and its opposition to "Pittsburgh plus" is founded, in part at least, upon the claim that "Pittsburgh plus" is hampering western industrial development. Shipbuilders are interested because their costs are higher. The farmers are interested because they believe farm machinery would be cheaper if the Pittsburgh obstacle were removed.

All the rest of industry that uses steel and is located nearer to plants outside of the Pittsburgh district is interested because it believes the removal of the Pittsburgh base will mean lower costs of steel through a reduction in freight rates. Some of the greatest legal minds and industrial experts in the country are engaged in this contest, the outcome of which will be awaited with interest throughout the country.

Mixing the Ounce of Prevention

What the Michigan Manufacturers' Assn. Is Doing For the State's Industry, Particularly in Legislation

ELECTION to public office does not change the human nature of a man. Instead, it gives him a greater opportunity for display of these traits of character which make him an individual apart from his brothers and which must put him on record as having either the attributes of statesmanship or the keen analysis of a judicial mind. Theoretically, at least, it is assumed that election to such a representative body as a state legislature presupposes the successful candidate to have a breadth of mind and a quality of citizenship which promises the greatest good for the greatest number in all decisions bearing upon the merits of statutory regulations and limitations.

This is all very pretty and sometimes true. Unfortunately it is two-thirds theory and the rest practice. This being a democracy, the number of votes rather than statesmanship or judicial tests qualify a man for legislative duties. The winning count may be determined by certain principles advocated by the candidate and approved by his constituency. On the other hand, popularity aided by political strategy may determine the result.

Whatever the vehicle upon which the legislator rides into office, whatever the principles he may openly advocate, the fact remains that the senator or the representative takes his seat chuck full of human nature, bristling with personal ideas, touched with certain antipathies; sometimes with definite aim to "get something or somebody" for doing something to somebody sometime or other.

Attention to Duty the Thing

We have with us always class legislators and class legislation. Labor organizes and goes after legislative advantage, hewing close to measures for the good of labor regardless of where the chips fall. Industry organizes to put a curb on what of labor legislation it

F. W. HUTCHINGS
Vice-President and Treasurer of the Charcoal Iron Company of America, Detroit

may deem unreasonable or detrimental to industry. So a merry time is had by all. The side that picks and chooses legislative candidates and then elects them in greater number gets the best of the deal when the statute makers begin the grind. Indifference on the part of one or the other of the interests concedes an advantage to the other; therefore the success of organization for legislative protection or advantage lies not in mere cohesiveness or numbers, but in attention to duties required by organization.

The industry of a state is its lifeblood. The richer this blood the greater the state. Yet industrial progress and achievement beget jealousy, suspicion, antipathies, real or fancied wrongs, and stir ambitions that may be good or bad for the common weal, according to the lights of the ambitions.

Michigan is a young industrial giant. It is overgrown physically and undernourished in those economic essentials which are born of experience. Its industrial successes have inspired attack back of which the desire for a division of spoils has been more or less an impelling motive. On the part of industry there has been a sense of false security which has to a certain extent so deadened aggressiveness as to render industry too often dependent upon the pound of cure because the ounce of prevention was ignored.

The most successful economic organization is that one which is more a practitioner of preventive medicine than a prescriber of remedies, and that is what the Michigan Manufacturers' Association is gradually coming to be. The transition has been particularly marked during the last two years. And it is well that it is so, for the next few years will be difficult ones for all industry. Michigan industry has just passed through what might easily have been a disasterous legislative period, but which, fortunately, has proved to be comparatively harmless.

Leadership and Good Sense

The reason it has been so harmless to industry lies in the leadership of the Michigan Manufacturers' Association and the good sense of the majority of the legislators in Lansing. The rock upon which industry might have been severely damaged was taxation. Another shoal which invited shipwreck was labor legislation. Swarming about these two main factors were the countless bills framed to exact tribute from one class or another of industry, intended to satisfy personal grievance or expected to rectify some imaginary wrong. All

NEW VICE-PRESIDENT AND DIRECTORS OF THE MICHIGAN MANUFACTURERS' ASSOCIATION

Left to right—C. E. Bement, vice-president and general manager of the Novo Engine Company, Lansing; second vice-president; A. M. Larsen, works manager, Manning, Maxwell & Moore, Inc. (Shaw Crane Works), Muskegon; L. F. Bomhoff, treasurer, Jaxon Steel Products Company, Jackson; Walter O. Adams, president and general manager, Production Foundries Company, Ann Arbor, directors.

Digitized by Google

told, there were 160 bills affecting in one way or another the industries of this state. Three of them attained to the dignity of statutory enactment.

The 1,200 or more members of the Michigan Manufacturers' Association have more cause to respect and support their organization this year than ever. The whole industrial and commercial life of the state owes a debt of gratitude to the Association for legislation which cripples or obstructs the healthy development of industry does harm to the whole economic fabric of the state. The Michigan Manufacturers' Association grappled with human nature in all its phases and prevented much adverse and costly legislation, which, in the years to come, would have required many pounds of cure.

One man who was largely responsible for the success of the united effort of the Association was John L. Lovett, its manager. Mr. Lovett came to the Association from an assistant secretaryship in the Illinois Manufacturers' Association, prior to which he was a newspaper man on the Chicago Tribune and Kansas City Star. As a newspaper man assigned to legislative work in both states at one time or another, he learned the inner workings of legislative procedure and the part played by human nature in statesmanship of assorted varieties.

Building Up the Body

When Mr. Lovett came to Detroit the Association had about 600 members, most of them A. W. O. L. both in body and spirit. As Mr. Lovett said recently in an address, golf was doing to the Michigan Manufacturers' Association what the automobile and Sunday baseball is supposed to be doing to the churches. The Association was organized partly on the theory that it was customary to have an association and partly because one or several industrial executives stole enough time from business to visualize what such an association could do. After it was organized its main function was to wait until the legislative crack of doom scared its members out of seven years' growth and then rush around for cover.

No man was to blame. The responsibility was collective. Every man who had a part in industrial management in this state was so smeared with success and loaded down with pelf that he had become near-sighted. That any man or organization of men would consider interfering with the growth of such a husky industrial baby as Michigan had was beyond his comprehension. When I joined the Association in September, 1919, and immediately began to buzz around the ears of the members with warnings of impending disaster unless the Association membership became both numerically stronger and more active.

His theory was that enunciated by President Harding, Secretary Hoover and others, that there should be more business in politics and less politics in business; or, put another way, more business in government and less government in business. He wanted the business men of this state to take a direct interest in the politics of the state, pay more attention to the men aspiring to public office and in prospective legislation, to the end that the cause of prevention might make unnecessary the pound of cure.

Practically all the state's industrial leaders had held the same view but they wore leather vests and kept their views so close to the vests that the best run of legislators who preferred to listen to reason failed of any benefits from the views. There were exceptions to this rule. Men like F. W. Hutchings, Arthur H. Williams, C. E. Bement, M. J. Murphy, A. B. Demory, Henry M. Leland, Frank C. Whitney and others subscribed to the same principles, and they set the example.

Two years ago when compensation legislation saddled industry with an annual bill of $9,000,000 in premiums on insurance and $6,000,000 in compensation, industrial management began to understand why the United States was successfully founded upon the theory that "United We Stand; Divided We Fall," and why "E Pluribus Unum" is the most effective motto displayed in the world.

Michigan made more out of its organization this year than ever in its history, but that part of it represented in the automotive industry lost a great opportunity when the first reductions in motor car prices were made. Henry Ford threw a monkey wrench into the machinery by announcing a price cut before any other manufacturer woke up to the temper of the buying public. The point is not that the Association could or would have urged or argued against such a cut, but that had the organization principle been applied, the industry would have known the impending change in public sentiment on prices and been prepared to act instead of being obliged to trail along after Henry.

At the annual banquet of the Association recently Mr. Lovett reviewed the course of legislation during the current session in Lansing. He took the members to task for their indif-

JOHN L. LOVETT

ference to the politics of the state, but his address not only illustrated the importance of attention to legislation but revealed the excellent work of the Association officers and committees during 1920 and 1921. Mr. Lovett said in part:

"A new member of the legislature came to me shortly after the beginning of the session in January, and he said: 'Do those manufacturers in my district belong to your association?'

"'I presume most of them do,' I replied.

"'Well,' he said, 'they do not even know I am up here. They do not know the name of the representative from their own district.'

"There is a lot of truth in that statement which can be applied to many districts in the state. The question in the mind of the average legislator is whether he is going to be returned to the legislature or, perhaps, whether he may be timber for Congress. Most of the acts of members of the state legislature by necessity are governed by the possible reward in votes. The manufacturers of this state are as much a part of the citizenry as are the legislators or any other class of enfranchised residents. They are entitled to have a voice in the conduct of the affairs of the state, particularly where the legislative and executive work of the state government affects their business and welfare. The legislators seem to know this better than the manufacturers themselves, and they expect to have their opinions on legislation.

"This indifference to state politics is illustrated by the fact that when I send out bulletins on proposed legislation, sometimes with the request that the members take personal action, I get telephone calls from members, requesting to know what district they live in and who are their representatives in the legislature. It is recognized that the executive of a plant is a busy man but I question if there are any other jobs in your plants more important than that of knowing who is your legislative representative and what your Senate and House of Representatives is planning to do you for, or do for you.

The Corporation Tax Law

"To show you how much the legislature can cost you, I call your attention to the Corporation Franchise Law passed at the last session. It provides for a 3½ mill tax on your paid-in capital and surplus. If you have a million dollars capital and surplus, your tax is $3,500."

It should be mentioned here that the Association did not fight this bill, realizing that the state needed money, and the manufacturers were willing to contribute their share to financing the government.

"We not only neglect the state legislature, but Congress," Mr. Lovett continued. "We neglect the elective officers. During the first 100 years of the existence of this country the business men took an active interest in its politics. If you will go back into the history of the acts of Congress, you will find that in 1887, when our country was building a good deal in the country, Congress passed the Interstate Commerce Act, the first regulatory act the business of this country had to submit to. Congress followed that with the Sherman Anti-Trust Act and then came the Clayton amendments, which created the Federal Trade Commission. This commission began to investigate and send questionnaires, much to the dismay of many manufacturers.

"In the last session of Congress an effort was made to license and set up a commission for the control of the coal mines. This was followed by the Kendrick bill for the licensing and control of the packing industry. I mention these things to bring to your mind what is happening in Washington and to show that all of this has happened during a period in the history of this country when the business men and manufacturers have been neglecting to note who the men are that are running for Congress or the state legislatures.

"I want to impress every man here with the importance of remembering that the state legislature is nominated in August every two years and that the largest job you have or will have in the next twenty years is to find out who the right man is to represent you, and see that he is elected. You do not need to fear radicalism if you have the right kind of public officials to enforce the laws.

"The farmers control the lower house of the state legislature and might control the upper house by political log-rolling. Fortunately for us, it takes sixty-seven votes to put through a constitutional amendment in the house and twenty-two votes in the Senate. So far this numerically has not been necessary. We defeated the income tax proposition in the regular session. We are likely to have another session of the legislature in January to consider other matters, and we are due for a running fire of legislation for the next two years. It is up to you men to take more of an interest in politics. It is not necessary to run for office but it is of interest to you to know what kind of men are candidates and whether they are likely to be fair in their decisions.

"All the manufacturers ask is a square deal. I have never asked a member of the legislature for anything more than fair consideration of bills affecting industry, and I am glad to

Every Dye Plant An Arsenal

Why World Disarmament Is Not Safe So Long As Any Nation Monopolizes Color Industry

GERMANY opened the war with projectiles seventeen inches in diameter and closed it with projectiles one hundred millionths of an inch in diameter—in other words, molecules of poison gas—chlorine, phosgene and mustard gas. All of these and many other chemicals as deadly were manufactured in the same plants, by the same men and with the same apparatus that had produced the brilliant colors and the soft shaded pigments shipped to the Allied countries to delight the eyes and tickle the vanities of mankind, while the Kaiser was planning a world conquest that would make Caesar and Napoleon look like bush leaguers.

In the innocent dye plants of the German empire the most insidious virus of a new kind of warfare was being developed, the characters of which were so numerous and indefinite that even the masters did not know their power. Had Germany known that this modern war was to start 100 per cent explosive and end 55 per cent chemical, the fate of the Allies would have been sealed within a few months after the opening of hostilities and before the United States could have rendered any effective aid.

As shown in these columns two weeks ago, Germany controlled and coal tar products industry because of her vast superiority in the knowledge of organic chemistry, organization and numerical strength of research chemists and her pitiless competitive methods encouraged by the apathy of manufacturers in other countries toward the development of a dye industry. By the same methods and facilities she controlled the manufacture of war chemicals, in quantity as well as in character and quality.

By F. W. HERSEY

A saner world talks disarmament but hesitates to speak too loudly until Germany has been disarmed. Remove the last tank, every airplane, Zeppelin, machine gun, "Big Bertha," all her shells, small arms ammunition, armored cars, her sabers and her bayonets, all her rifles, pistols and hand grenades, but leave her dye industry intact, and Germany is armed and ready for a more devastating war than history so far reveals. Give her two innocent units of peace time progress—commercial aircraft and dye works—and Germany will rule supreme—unless every other nation is similiarly armed—with aircraft and dye works.

The burden of this article is the topic of the moment among the chemical and dye manufacturers of this country. Its keynote is: There must be no world monopoly of the dye-making industry. Every nation that hopes to remain independent, prosperous and as happy as nations are permitted to be in this vale of tears, must have its dye industry equal, in proportion to its size, to every other nation's dye industry.

The United States, with its vast resources and uncrowded areas, regarded with jealous, avaricious eyes by other nations cramped for room and starving for resources, must have a dye industry as great as its national risk. All its steel, powder, metal and ordinary chemical resources, all its plants and manufacturing genius will be of no avail unless it can manufacture dyes and coal tar products in variety and quantity equal to the ability of every other nation. The accomplishment of such an ambitious purpose means knowledge and continued research in organic chemistry, the necessary supply of chemists and the frequent discovery of new and valuable aids to medicine and industry.

When Germany began to pour mustard gas into the ranks of the Allied armies the rest of the world did not know what it was. Because the United States had no dye plants and no organized research in organic chemistry it took us eleven months to produce the same gas, and in the meantime this lack prepared ness cost us 300,000 casualities.

In telling the story of mustard gas to a large audience in the Detroit Board of Commerce building, recently, Joseph H. Choate, Jr., said that the solution of the mustard gas problem came from a small dye shop that had been taken from the Germans by the French. After this shop was finally discovered it took just one week to begin the production of mustard gas. As Mr. Choate pointed out, the United States had a wall of Allied armies and the whole British navy between it and possible German aggression, and behind that wall we began to develop a dye industry and produce the necessary chemicals for war. In another war the United States might not have such protection.

Another telling point made by Mr. Choate was this: "Few of the weapons and gases we know of now will be used in another war. The discovery of a method of offense and its defeat by an efficient method of defense ends its usefulness. Success in modern warfare requires constantly new and more terrible engines and means of destruction. We know now that any future war will be one of chemicals largely, and the more we know about organic chemistry the better armed we will be. Old methods of war required the maintenance of fortifications, guns, shell and explosive plants, arsenals and innumerable other

General View of the Proposed Durant Motors Plant in Lansing

AFTER the drawing here shown was completed, a large addition to the plant was decided on. This will be a wing 20 by 400 feet, tied into the main assembly branch. A warehouse, to be constructed later, probably not this year, is also lacking in the drawing but is indicated in the engineer's blueprints.

This cut gives, however, a good idea of the division of the Durant Motors brought to Lansing by Edward Ver Linden, formerly one of the big figures in the General Motors Corporation. The long view is of the general assembly building. It faces the proposed new street to

Digitized by Google

units. The cost has been enormous and will continue to increase as the years go by.

"On the other hand, the maintenance of a dye industry as a peace time operation which is not only self-supporting but profit-bearing. One German general said that every dye plant was an arsenal, which covers the case perfectly. When gas was first used it was expelled from cylinders and allowed to roll down the wind. Later it was distributed from shells fired from guns. Near the close of the war improved cylinders of light and cheap construction were used. Soldiers could seek safety beneath underground shelters and listen to the huge shells singing overhead, but when the gas came there was no protection. It penetrated into every nook and corner; it lurked for hours and sometimes days in hidden recesses and no man knew when or where he might run into it. In retreat the Germans filled abandoned dugouts and demolished buildings with it, and the Allied troops, in their headlong advance, succumbed to its stifling, burning, killing fumes.

"Knowledge is the prime requisite in chemical warfare. Any men who has the knowledge can make the deadliest gases with a teakettle and two shaving mugs in an old shed. What we know about war is not dangerous, what we do not know about it is. A nation well supplied with commercial aircraft and dye plants would need no other plants to do its drop cylinders of poison gases upon armies and cities and the casualties would be frightful. The successes of the red armies against the Poles were entirely due to what gases did they get it? Russia has no dye plants. The answer is, Germany. Imagine a combination of German dye plants and the bolshevist ambition to destroy existing social orders!"

The Gases and Other Derivatives

The very nature of the gases derived from coal tar products makes it deadly. It is egotistic, consisting of particles having the utmost aversion to each other. Once released these particles fly apart and move with great velocity in every direction—anywhere to get away from possible contact with each other. Hot gases in hot cylinders become, then, the most effective weapon known to man.

Gas is not the only derivative from coal tar to be considered. There are the explosive materials made from benzene, toluol and naphtalene. When France girded herself for war she had 4,000 "75's" but no melinite for the shells they fired. France had been caught in the closely woven dye web and had to go out of the country for melinite, and the source of her supply was—Germany. Melinite and trinitrotoluene are hydrocarbons extracted from distilled coal tar, in which is incorporated oxidized nitrogen.

Germany succeeded in freeing herself from Chilian nitrates and in extracting oxidized nitrogen from the atmosphere, an element necessary in the manufacture of high explosive. Chile was the only source of nitrates for the Allies. Germany was the only nation in the war that could make explosive entirely in her own country, because she had a dye industry five times greater than any other country.

Dr. Charles H. Herty, member of the Conference on Reparation Dyes, told a committee. at committee that Sections 168 and 169 of the Peace Treaty provided for the chemical disarmament of Germany by the destruction of her surplus dye works, but the American influences were exerted against the execution of the provisions, despite the fact that all Europe desired it. Before the war closed, Dr. Herty said, the nation knew of the possibilities of destruction through gas bombs and slow evaporating liquids dropped from airplanes and the effectiveness of smoke candles of a toxic nature dropped from aircraft or released from submarines, but because the warring nations were so equally matched, each feared to start it. Congress has yet to realize the importance of chemical warfare, as evidenced by the fact that of $24,000,000 appropriated for the fighting forces only two-tenths of one per cent is for chemical warfare, which caused more than one-third of the casualties.

Maj. Lefebure said, in an article published in Metallurgical Engineering, that, of the three factors in warfare—combatants, mechanical armament and chemical constituents—the facilities necessary for the last named factor were the easiest converted from peace time to war time activity. The means for chemical warfare cannot be destroyed or curtailed in peace times because they are too closely connected with industry. There is only one way to guarantee protection and that is by preventing any nation from maintaining a chemical and dye monopoly. Production is the key to the war use of any invention, and in the face of Germany's chemical warfare, the United States and the Allies were woefully weak in production of chemicals when their importance had been established.

"The dye industry is an international question calling for the re-distribution of the industry with each nation's legislative power supporting it at home." Major Lefebure said.

A few extracts from statements by military men and leading scientific men show the situation.

Major-General W. L. Sibert, former director of the United States Chemical Warfare Service—"Five of the guns used by the German army in the late war were composed of materials used in dye manufacture. These materials passed through the same processes for dyes or gases or explosives up to the point where they became the raw materials for toxic gases and explosives. Any industry using electricity is equally available for war or peace, and the dye industry uses electricity."

Rear Admiral Ralph Earle, U. S. N.—"In case of war it should not be necessary to expend time against time to build intermediary explosive and chemical plants, and it would not be necessary if the United States had a dye industry. The average dye works can be converted into an explosive or chemical plant in three weeks. Toluol, phenol and xylol are important chemical combinations that come from dye plants."

Col. C. T. Harris, assistant to the chief of manufacturing, Ordnance Department, U. S. A.—"An American dye industry would have the advantage that it would increase the number of chemists, particularly research chemists; it would increase research in coal tar products; it would provide permanent plants for the manufacture of explosives and chemicals for war purposes, when needed. Diphenylamine, a stabilizer of smokeless powder, was found by accident while making research investigations in coal tar products. T. N. T. came from the same source but were discovered by the German chemists."

Col. J. H. Jones, acting chief of the nitrate division, Ordnance Department—"We already have arranged with dye manufacturers in this country to make tetranitro aniline to take the place of T. N. T., and it will be known as T. N. A."

Dr. M. T. Bogert, professor of organic chemistry, Columbia University, and director of research and chemical technology of the National Research Council, and of the gas service organization in this country—

"A well developed synthetic dye industry is absolutely necessary for the security of our country. The search for dyestuffs has been responsible for all the research work in the distillation of coal tar. It is a basic and essential industry. Chlorine, one of the essential ingredients and the backbone of most toxic gases, came from the dye industry, which provided Germany with enormous quantities of it. It was first used by Germany at Ypres, April 22, 1915. We can produce all the dye we need, more that are not yet known, and better dyes than Germany can, once we get started. So far our experimentation and production has been on such a small scale as to be only sufficient to show what we could do if we tried."

Thomas A. Edison—"Give the United States a license law for four years and we will beat Germany at her own game. During the early part of the war I erected the first plants for producing benzol and toluol. The latter was used to make T. N. T. The benzol was used in my plant, where I produced the first synthetic carbolic acid for our government, from which it made picric acid explosives at Picatinny, N. J., and Indianhead, near Washington.

"I was the first one to produce aniline oil in quantity for the textile mills, at their request, to prevent them from shutting down. I was also the first to produce in this country paraphenylenediamine, which saved the fur dyers from closing their doors. Other very necessary chemicals were also produced in these early plants. Altogether, I put up five chemical works and four subsidiary plants, all of which were erected within 65 days from the time of starting. I continued to operate these various plants until other manufacturers could supply the market, when I retired and sold the apparatus to various chemical works. These facts are mentioned to show that I am familiar with chemical manufacture, but I no longer have any interest in this kind of production.

"I have been reading about the various schemes that are being put forth for protecting our factories against German low cost until they get a little more experience. It is my opinion that nothing of the kind should be granted, by tariff, which would be no protection at all, but by a licensing system, good for, say, four years, at the end of which Congress, if necessary, could extend the license. I believe that ultimately the Americans will beat the Germans at their own game."

On the Medical Side

Either war or industry to be vigorously prosecuted must have a nation of healthy workers or fighters behind it. Man is everlastingly fighting disease; and the general headquarters of all the fighting forces is the research laboratory. There the biological theory that attributes disease to microbes and bacteria was discovered and many of the anti-toxins that have rendered diseases less virulent, if not entirely impotent, came from the same source. These anti-toxins either kill off the germ life or neutralize the germ poisons.

One of the prolific sources of these anti-toxins has been the dye plant. Adrenalin, which formerly came from the glands of sheep, and therefore was costly, is now derived from coal tar intermediates. Aspirin, phenacetin, procaine and barbital, perhaps the better and important antiseptic, came from the dye plant laboratory. Salvarsan, the best known cure for the human plague, was discovered in German dye works but today it is made in the United States at much less cost and more effective in character than it is produced in Germany. When Germany controlled the dye industry she sold this and other synthetic drugs in the United States at four times the price she demanded in the Canadian market.

Dye materials come in three classes, crudes, intermediates and finished product. The crudes can be found in any steel plant and in the coal tar industry. They are by-products which result not so much from skill as from the nature of common and well-known operations. From the state of intermediates to the finished product there must be applied a great amount of scientific skill.

The greater this skill the greater production will be and the lower the cost of the by-products obtained. In the beginning these processes do not spell economy because the yield in products is often discouraging, with a great amount of waste. German chemists have been working and experimenting so many years that they have been able to get as high as 90 per cent yield. Mr. Choate made this very plain in his address and added that utmost encouragement should be given the American dye industry so that time and skill could be made less costly problems.

General Motors' Outlook Is Said to Be Improving

Referring to the recent decline in General Motors Corporation common stock, the Wall Street Journal said:

"Selling of the last few days, which put the common below 12, probably represents the liquidation of speculative holdings by people alarmed at the prospect of a general slump in the automotive industry. So far as General Motors Corporation is concerned, however, it is at the moment in better position than earlier in the year. For the first quarter common dividend requirements of twenty-five cents a share, or $5,000,000 for the 20,000,000 shares, were not earned. It appears certain that the dividend will be earned in the current quarter.

"Even in the face of a probable falling off in business during the last half of the year, General Motors should make a fairly good showing because it has succeeded in substantially reducing overhead. Production schedules at the beginning of the year were laid out on a basis of approximately 50 per cent of operations in 1920. Plans were made, however, whereby output could be quickly expanded whenever necessary.

"It has been rumored that General Motors was seeking to dispose of some of its passenger car divisions, probably Oakland and Oldsmobile. No such project has been under discussion, although the management is not entirely satisfied with Oakland. A general reorganization of this division is being undertaken which, when completed, will greatly strengthen the position of General Motors as a whole.

"As a further measure of retrenchment it is not unlikely that the company will greatly curtail or give up altogether some of its activities in lines not directly affiliated with the automotive industry, such as the Frigidaire Corporation, Sunnyhome Electric Company, etc."

The Corporation announces that it has not disposed of the Frigidaire Corporation, which manufactures refrigerators, but that the activity of the Frigidaire is being extended through the sales organization of the Delco-Light Company, a subsidiary of the General Motors, in Dayton, O. The Sunnyhome Electric Company, which manufactures domestic farm light plants and accessories, has been consolidated with the Delco-Light Company.

MOVIE SHOWS BELT MANUFACTURE

The Charles A. Schieren Company, tanner and manufacturer of leather belting, has had a four-reel motion picture made of belt manufacturing operations from the tanning of the raw hide to the packing of belting for shipment. The tanning process, cutting, shaving, scouring, "stuffing" to make the leather pliable, and the stretching operation are shown. The company manufactures belts from one inch to 72 inches wide, and has tanneries in Bristol, Tenn., near the source of oak bark supply, a plant for belt making in the same city, another plant in New York city, a rawhide lace factory in Brooklyn and seventeen branch offices throughout the country. The motion picture film was made as an educational feature to be displayed at meetings, in industrial plants, and wherever there is an interest in tanning and belt manufacturing. The Detroit office of the Charles A. Schieren Company is at 65 Shelby street. J. A. McGee is manager.

REALTY CONVENTION PLANS

The Michigan Real Estate Association will send a delegation of 400 members to the convention of the National Association of Real Estate Boards, Chicago, July 12 to 15.

STRAIGHT LINE METHODS

Courage in Business

All modern industrial and mercantile expansion depends upon courage. It explains progress. It determines the limits of individual success. It is the physical expression of confidence and belief.

Business moves forward only so far as it is led by men with the vision of new conditions, new ideas, new forces, new methods —*and the courage to put them through.*

Business weaklings are left behind at the end of every period of inflation. Courage is not governed by conditions; it controls conditions. It not only recognizes, but eliminates, weak organization, mistakes, inefficiency.

Courage is inspired by knowledge. Knowledge dispels fear. Knowledge of your business—timely and dependable Facts and Figures from every department—points out weakness and waste; while knowledge of better methods, *with courage,* eliminates them.

OLDS PRODUCTION INCREASED

The Olds Motor Works, Lansing, has resumed operations after being closed for a short time due to the receipt of rear axles which did not meet the requirements of the company. This delay will necessitate greater efforts to meet the demands of the sales organization. The plant is now 10,000 cars behind orders, and preparations are being made to increase production to 160 a day, the highest so far this season being 133. Most of the cars are to be delivered during the next three months. Many sales agents and distributors of the company in various parts of the country are visiting the plant to arrange for early shipments. Among those who have been here for conferences with officials of the sales department are H. H. Hall, Frank Witt and B. J. Kenyon, of the Illinois Oldsmobile Company, Chicago, the largest distributors of Oldsmobile products.

STUDEBAKER PRODUCTION

President A. R. Erskine, of the Studebaker Corporation, Detroit and South Bend, Ind., is credited with the statement that during the first six weeks of the second quarter of this year 10,000 Studebaker cars were made and sold and that the company had orders on hand recently for 7,600 cars. Production as planned for June is said to call for approximately 8,000 vehicles.

STROMBERG CARBURETOR REPORT

The Stromberg Carburetor Corporation's net income during 1920 totaled $787,443, as compared with $870,566 in 1919. Net profits were $340,101, as against $401,328 for the previous year. Total assets on December 31, 1920, were $3,290,301, as compared with $3,476,809 at the end of 1919. The surplus was $2,344,943, as against $2,255,965.

FISHER BODY'S BUSINESS

Although there has been some slackening in the automobile trade the Fisher Body Corporation is at present doing the biggest business in its history, says the Wall Street Journal. Aside from its General Motors contract, which is on a cost-plus basis, the Detroit company makes bodies for numerous other manufacturers, including Ford, Cleveland and Chandler.

OUTPUT NOW 20,000 DAILY

The American Bushings Corporation, Marysville, which is making bushings for the American and Canadian Ford companies, has increased its production to 20,000 a day. Important changes in the method of production have been devised by President J. W. Leighton.

WILL MAKE OWN WIRING EQUIPMENT

The Willys-Overland Company, Toledo, is making arrangements to manufacture wiring equipment for Overland and Willys-Knight cars at the Toledo plant instead of having them made by the Electric Auto-Lite Company, as at present.

MAXSON WITH DURANT MOTORS

L. D. Maxson, purchasing agent of the Olds Motor Works, Lansing, has resigned to accept a similar position with Edward Ver Linden, general manager of the Ver Linden division, Durant Motors Corporation. Until the new plant is in operation he will have purchasing authority for all material to be used in the plant, as well as the mechanical equipment. Mr. Maxson began work with the Olds in the purchasing department 16 years ago, and was made purchasing agent by Mr. Ver Linden three years ago. His successor has not yet been announced.

STEVENS-DURYEA ADDS MEN

It has been announced that the Stevens-Duryea Motor Company, Springfield, Mass., added 150 men to its force last week and that its Williamansett plant has reopened. Production has been increased 50 per cent.

BUSINESS BETTER IN COTTON BELT

Walter Zimmerman, special representative of the Olds Motor Works, Lansing, has returned from an extensive trip through the cotton belt with a report that business conditions are better in Texas, Mexico has a more stabilized government and is beginning to buy in Texas. Cotton growers are more optimistic because an effort is being made to finance the cotton interests through a banking pool, he says. However, the night riders are still busy destroying property. With proper financing and rates of exchange, he declares, European countries will be in the market for cotton as millions of spindles are idle there

AUTO LICENSE ISSUE INCREASED

Up to May 1 there has been issued 381,672 auto license plates by the department of state in Michigan. Another 15,000 have been sent out since. Four hundred and fifty thousand plates have been ordered for this year, while last year there were less than 412,000 licenses issued.

REO CANADIAN SALES STRONGER

Canadian sales of the Reo Motor Car Company, Lansing, are increasing. Large orders have been received from the Windsor agency for Ontario, Quebec and the maritime provinces, while the western market is also opening up. Production in Windsor is approaching normal in the face of the economic depression in western Ontario.

AUTO CLUB PLACES SAFETY SIGNS

The Lansing Automobile Association has placed safety signs in the neighborhood of schools throughout the city. These carry the words, "Drive Slow—School Ahead." About 200 of the placards have been placed. Later the association will place signs at the dangerous corners of the city.

WHEEL WOOD SUPPLY ASSURED

The Motor Wheel Corporation, Lansing, need not worry about a timber supply for the next 50 years, according to officials of the company. Emil Brock, of the Weis-Lesh Manufacturing Company, Memphis, Tenn., a logging and spoke manufacturing unit of the corporation, has been in Lansing for a conference with H. F. Harper, general manager, and other officers of the concern. The Memphis unit has a large supply of raw material ready for shipment to the wheel units in Lansing. At present the mills are running at a lower production than a year ago.

CAPITAL AUTO IN NEW QUARTERS

The Capital Auto Company's repair and service department, Lansing, is now located in the Porter building, formerly occupied by the Lansing Taxicab Company. The offices, salesrooms, used car and storage departments are also located in this building, bringing all departments of the company together. Ample accommodations are provided and a complete stock of Dodge motor car parts is carried.

RICE DINED BY ASSOCIATES

H. H. Rice, recently elected president of the Cadillac Motor Car Company, was tendered a complimentary dinner in the new plant a few days ago by 375 associates in the company's executive offices. In an address he said that the reduction in discount rates and the easier credits indicated a gradual improvement of the business situation and in a short time the automotive industry would be stronger than at any time in its history.

CHURCHILL JOINS BUICK

Charles W. Churchill, formerly general manager of the Winton Company, Cleveland, has been added to the sales force of the Buick Motor Company, Flint. He is a director in the National Automobile Chamber of Commerce.

BURNETT GOES TO CADILLAC CO.

Verne E. Burnett, who has been in charge of advertising at the plant of the Liberty Motor Company, Detroit, has resigned to join the advertising staff of the Cadillac Motor Car Company, Detroit. Mr. Burnett, prior to going into the advertising business, was on the editorial staffs of the Detroit Free Press and Detroit News at different times.

Million-Dollar Tire Plant for Bay City

ABOVE is shown the first unit of the plant of the Wildman Rubber Company, Bay City, the contract for the erection of which has been awarded to the Bay City Stone Company, which put in the foundation. This unit is 365 by 161 feet in dimensions, three stories and basement, and will be built of reinforced concrete, with brick facing, asphalt mastic floors and composition roof. The equipment will be of the most modern design.

The plant is located on the Saginaw river with deep water frontage of half a mile, and on a tract of 63 acres donated by the Bay City Board of Commerce and J. F. and R. P. Leahy. It is of such size as to permit of the manufacture of 2,500 tires and 5,000 tubes daily, and when conditions warrant the company has enough land for plant extensions which eventually will make possible the production of 50,000 tires and 100,000 tubes daily.

W. W. Wildman, president of the company, is one of the pioneers of the rubber industry, having been for some years president of Portage. James C. McCabe, for several years secretary of the Bay City Board of Commerce, is secretary of the company.

BOWERS ON COLUMBIA STAFF

J. T. Bowers, for years a piano and dry goods salesman, and who has been connected with Grinnell Brothers for a number of years, has joined the sales organization of the Columbia Motors Company, Detroit, as commercial manager.

DURANT TO CONTROL SHERIDAN

While thus far no official announcement has been made by Durant Motors, Inc., regarding the recent transaction involving the Sheridan Motor Car Company, Muncie, Ind., which was one of the General Motors properties, this publication is in a position to state unofficially that Durant Motors, Inc., will own a controlling interest in the Sheridan Motor Car Company, which will manufacture an exclusive six-cylinder car to be sold at a popular price. D. A. Burke, will continue as president and general manager of the company and the Muncie plant will be in quantity production by January, 1922, with a capacity of 25,000 cars annually.

REO ORDERS 1,000 BODIES

The Hayes-Ionia Company, Ionia, has received an order for 1,000 high grade bodies for the Reo Motor Car Company, Lansing. This is a new body and was designed by Victor Preston. The company also has made 100 bodies for Durant Motors, Inc., and will be delivered in the near future.

COMMERCIAL HAULING

JITNEYS CUT TROLLEY REVENUE

Motor busses are cutting heavily into the proceeds of the Toledo Traction Company. Reports from that city state that in three months the street railway lines accumulated a deficit of $204,301. Bus operation is netting a revenue approximated at $1,000 daily.

Bus fares are five cents and street car fares are six cents, with one cent charge for a transfer. The railway company has a stabilizing fund which will be reduced so low by August 1 that fares will have to be increased again, it is expected.

A city ordinance recently passed has established a license fee of $100 against the buses and requires a $10,000 indemnity bond for operators. This is being contested.

BUS RATES REDUCED

George Wilson, who operates a freight and passenger motor service between Sault Ste. Marie and Pickford, has announced a voluntary reduction in rates, effective June 1. Mr. Wilson announces that he will continue his service twelve months in the year, which is a departure for the upper peninsula.

BRIDGMAN BUILDS TRUCK DOCKS

Increased facilities for handling fruit shipments and other merchandise by motor truck in the Benton Harbor-St. Joseph territory are being built at Bridgman, in Lake county. Glaras & Katsulas are building a fruit loading station near the plant of the Bridgman Fruit Growers' Association plant. It is planned to make delivery of all freight from this warehouse that arrives from Chicago over the Graham and Morton line by trucks. The use of motor equipment will speed up the service between Chicago and the twin cities, it is reported.

SCHOOLS USE MOTOR BUSSES

Motor busses are revolutionizing the rural system of education. Standard schools, to which children are brought in these vehicles, are replacing the old fashioned country school. There are now 12,000 standard schools in the United States, according to the United States bureau of education.

A compilation recently made shows the number of children carried to standard schools and the percentage of them that travel by busses. Figures were obtained from the superintendents of public instruction in the respective states, which show the following:

State	Children Carried	Carried by Motor Bus
Florida	7,867	nearly 100%
Alabama	4,944	78
Illinois	200	78
Kentucky	4,569	66
Delaware	510	60
Washington	20,000	45
Iowa	30,000	40
Minnesota	16,268	25
Massachusetts	25,325	18
Connecticut	2,356	11
Vermont	3,570	few
Mississippi	30,772	not recorded
North Dakota	23,000	" "
Georgia	5,742	" "
Texas	2,683	" "
South Dakota	2,288	" "

Early Coal Purchases Urged by I. C. R. R. Head

C. H. Markham, president of the Illinois Central Railroad, in a notice sent to freight agents and manufacturers urges the early purchase of bituminous coal for manufacturing purposes while there are 225,000 idle open top cars and hauling conditions are most favorable to the railroads. Mr. Markham says the present rail equipment is sufficient to handle an evenly balanced tonnage of coal if the bulk of this tonnage is thrown upon the roads in the fall and early winter, there will be another coal shortage.

He calls attention to the fact that there is only a small quantity of coal above ground and the present output indicates that during the latter half of the year it will be necessary for the mines to produce and the railroads to haul 380,000,000 tons of bituminous to equal the output of 1920, which was a short year.

The coal shortage of 1920 forced the Interstate Commerce Commission to rule that all open top equipment be used for coal, which resulted in a shortage of road and building materials, also carried in open top cars. However, there is no indication of any competition between the coal industry and the building material industry for open top cars, but on the other hand, as Mr. Markham points out, a mad rush for coal in October, November and December will result in price increases and delayed shipments, especially if the railroads have a bad fall and winter.

FURNITURE EXPOSITION OUTLOOK

A large number of applications for reservations have been received by the Pantlind Hotel, Grand Rapids, in connection with the summer furniture expositon, which will open June 27. In this connection the Grand Rapids Press says:

"There will be more sellers in the market, it is expected, than in any former season. The exposition buildings are filled and many new lines are promised. All the space in the Blodgett, which has been only partially filled in recent seasons, has been taken and there is a strong demand for outside space for exhibits that cannot get into the exposition buildings.

"The Conrey-Davis Company, Shelbyville, and the Orinoco and the Lincoln Chair Companies, Columbus, Ind., which dropped out three years ago to put their capacity into phonograph production, will be back in the market with new lines. The Connersville Furniture Company also dropped ont to manufacture phonographs and it is as yet uncertain whether it will be back.

The Grand Rapids manufacturers have their plans for the new season well advanced. The market was pretty well cleaned up of surplus goods at the mid-season sale and the new season will produce many new patterns."

VACUUM OIL'S NEW BRANCHES

The Vacuum Oil Company, 61 Broadway, New York, has opened two new branch offices to take care of the increased demand for its products, Gargoyle mobiloils for automobiles, tractors, etc., and Gargoyle lubricants for plant lubrication.

The new offices are located at Buffalo, N. Y., and Dallas, Tex. The Buffalo office will cover New York state west of the Hudson river. The trade will be supplied from the company's plant at Rochester, N. Y., or from warehouses at Buffalo and Albany.

The new Dallas office will cover the states of Texas and Oklahoma. Warehouse stocks will be carried at Dallas, Texas City and Oklahoma City.

Malcolm McIntyre, eight superintendent of the Detroit United Railway, has resigned to become general superintendent of the Mobile Railway Company, Mobile, Ala. Mr. McIntyre has been connected with the D. U. R. twelve years.

Brass Forging Work Success With Mueller

During the war, brass forging, which was more or less in the experimental stage prior to 1914, was given a marked impetus, especially in the Port Huron and Sarnia, Ont., plants of the Mueller Metals Company, where considerable research work in forging brass and bronze had been going on for some time. Production of brass forgings in the Sarnia plant of the company was pushed energetically until it reached 225,000 forged fuse parts daily. After the armistice the company continued with its development work, and during this period of depression it is making tools and dies for the production of brass forgings for the automotive and other industries throughout the country.

The new process for forging brass developed by the Mueller company will, it is believed, help considerably to reduce the cost of production in plants making brass products of one kind or another, particularly in automotive plants where considerable brass is used. Where brass forgings are used, they will, to some extent, replace sand castings, although at present the Mueller company has not been able to produce forgings where core holes are used, or parts weighing less than three or four pounds.

The principal arguments for forged brass parts are summarized as follows:

Forged under 200 pounds pressure per square inch while the metal is at a cherry red heat, brass forgings have no sand holes nor flaws. The metal is as fine grained as tool steel and is claimed to be 80 per cent stronger than sand castings.

The Mueller comparison of physical properties is as follows:

	Brass Forgings	Sand Castings
Tensile strength	54,000 pounds	30,000 pounds
Yield point	28,000 pounds	15,000 pounds
Elongation	30%	20%

It is claimed that special bronze forgings can be made to equal a tensile strength of 105,000 pounds. The greater strength is considered equivalent to lighter weight parts for the same service. These forgings are made to .005 of an inch on diameters of .010 of an inch on lengths. The surfaces are smooth and free from scale, which reduces the cost of buffing, polishing and nickel plating.

Increased production with attendant economy is claimed because there is less material to be removed, the material is free-cutting and uniform, exact dimensions save time in chucking, tools last longer without grinding, rough machining operations are not required, the forgings wear longer, there is less scrap metal, more pieces to the pound and less labor required in preparing the parts for assembly.

NEW TARIFF BECOMES EFFECTIVE

The following articles, previously free of import duty, have been declared taxable under the recent tariff: Cattle, sheep, corn, grain, flour, sugar of milk, cotton, fresh, frozen, prepared or preserved meats cream, fresh, preserved or condensed milk, cocoanut and cotton seed oils, potatoes and all grades of wool. This measure is to be effective for six months pending a permanent tariff. The measure empowers the Secretary of the Treasury to use penalties in staving off dumping of foreign-made goods, continues the wartime control over importation of dyes, and operates to clarify tangles in the assessment of duties which result from fluctuating exchange rates.

DETROIT TAX RATE INCREASED

Detroit's tax rate will be between $21.60 and $21.65 for 1921, according to official announcement. Th's is an increase of $1 over the 1920 rate. The assessed valuation is $1,858,476,350, an increase of $150,360,620 over 1920, and the increased personal assessment is $38,000,000.

Flint's Much Needed Belt Is Materializing

For several years a railroad belt line has been proposed in Flint. It has been pointed out that it would mean without doubt a rapid expansion of the city's industrial area. According to announcements made a few days ago both by city officials and executives of the Pere Marquette railway, the belt is now practically assured. In fact, President Frank H. Alfred, of the P. M., is quoted as saying that a new corporation, independent of the railroad company, probably will be formed to construct and operate the line and that the first section is to be completed by July 1, 1922, and the remainder by July 1, 1924.

About all that remains to be done in order to be able to say that the project has actually materialized is the attaching of the signatures of the mayor of Flint and the city clerk to the contract which has been drawn up between the city and the Pere Marquette, says the Flint Journal, which adds:

"Authority to sign the contract was granted by the common council but the document will not be signed, it is understood, until the full amount of the purchase price of the right-of-way has been subscribed by citizens who are donating the land to the railroad company. This amount has been fully underwritten by various organizations and individuals in order to safeguard the interests of the city, since the charter prohibits the donation of land to the railway company, it thus being necessary that the land be purchased by private subscription, and a quiet campaign is being conducted to obtain subscriptions for the amount still needed, which is expected to occupy but a very short time."

It is said that options on most of the property were obtained at very low figures, although some portions of the right-of-way will have to be condemned, which will not delay work, inasmuch as the P. M. will be permitted to give bond to cover the probable cost.

A special committee of trustees has been appointed by Mr. Edwin W. Atwood, consisting of Arthur G. Bishop, J. Dallas Dort and Leonard Freeman, to receive donations on behalf of the city, the money not to be handled by the city or in connection with the city funds.

It is likely that the one thing which has contributed much of late to bringing the matter to a head is the proposed location of a plant of the Durant Motors, Inc., in a part of the city where the belt line will be all important.

"Securing of the Pere Marquette cut-off means the opening of a great industrial district in the east side of the city," adds the Journal. "It extends nearly eight miles from a point north of Grand Blanc to McGrew's Station near the waterworks plant north of the city, with factory sites available practically the entire distance. The city's industrial expansion has reached its limit in other directions, but the opening of the east side district will mean that the city can now invite other industries here with adequate factory sites and transportation assured."

CREDIT MEN'S ELECTION

S. Owen Livingston has been elected president of the Grand Rapids Credit Men's Association. Other officers are Richard J. Prendergast, vice-president; Frank V. Blakely, secretary; Clyde L. Ross, treasurer; executive committeemen, Rudolph M. Bremer, L. Z. Caukin, Charles H. Gallmeyer, Charles Holden, Lee M. Hutchins, Carl S. Hester, John D. Karel, A. H. Merritt and Allen K. Tyson

Transportation

Benton Harbor—The Benton Transit Company started its season's navigation this week, with the steamer Frank Woods. The boat will make three trips a week, from Benton Harbor to St. Joseph and Chicago, and return

East Tawas—Under the direction of J. K. McHarg, Jr., president and general manager of the Detroit & Mackinac Railroad, new repair shops have been built of concrete and equipped with modern machinery. Headquarters have been located in East Tawas and gradually the offices of the purchasing department, now in Detroit, the operating department and the traffic department, formerly in Bay City, are being established in East Tawas. Two large dwelling houses have been purchased and furnished for office work.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—Plans for on own-your-home exposition have been submitted to the Detroit Real Estate Board by Robert H. Sexton, president of the Business Counsel Corporation, New York city. A similar exposition was held in Chicago in March. If the exposition is held a special building will be erected for it and the date will be in September or October.

Lansing—The Brown & Gordon Company has closed a contract with the H. G. Christman Company to furnish all the sand and gravel for the new Durant plant, which will require about 100,000 yards. To care for this big contract a new sand and gravel washing machine has been installed.

Detroit—The schedule of contract lettings by architects and general contractors as prepared by the Detroit Builders Traders Exchange for the week ended May 26, includes a building to be erected in Royal Oak for the First State Bank of Royal Oak; a number of stores and residences, alterations to an office building, and some minor jobs. As for projects in the hands of architects, they include a brick and steel 57-apartment building, a brick and steel 30-apartment building and a three-story 16-apartment. Other work was a brick and steel one-story market building, a brick ladder house to be erected at McGraw and Martin avenue, an addition to the Doty school, a brick and steel factory building, a solid brick store, office and dance hall building, and a large amount of smaller construction.

Holland—The Willis Road Construction Company, Detroit, has been awarded a paving contract by the city council involving an expenditure of $77,445. The job includes, besides paving Ninth street, the installation of curb, gutters and other incidentals.

Lansing—The Wolverine Insurance and the Michigan Employers' Casualty companies have decided to erect a five-story office building here to provide for increased business. The companies will occupy the first two stories. The Wolverine Building will cost approximately $150,000. The Wolverine company was organized a year ago to specialize in auto insurance as an old line company, and also to write insurance on business property. The company has authorized an $800,000 stock issue, putting the concern in the million dollar class, as $200,000 of the stock has already been passed upon. The remainder will be placed on the market as soon as approved by the Michigan Securities Commission. The price of Wolverine stock went from $40 to $50 June 1.

Lansing—The city council has voted to submit to the people at a special election the question of issuing $200,000 in bonds or the erection of a memorial building to the veterans of three wars, the structure to include an auditorium, club rooms, banquet hall, etc.

Detroit—The Fellowcraft Athletic Club is planning the erection of a clubhouse to cost between $2,000,000 and $3,000,000, to be located at Second avenue and Ledyard street, facing Cass park, and to be ready for occupancy in 1923.

Lansing—Prospects of another industry for Lansing are indicated by negotiations opened for the establishment of a paper mill by David Friedland, of the Friedland Iron Company. A site along the Grand River would be provided, and with good shipping facilities, the central location for securing waste material in the state and the distribution of the product, the opportunities for such a plant are believed excellent. Lansing takes about 25 per cent of the product.

Detroit—The board of education has awarded contracts for the erection of three school buildings as follows: Noble school, in Fullerton avenue, John Bollin Company, $127,885; an elementary school in Joy road, John Bollin Company, $126,800; an elementary school in Broadstreet boulevard, Max Bartholomael, $127,380.

Lansing—The Reiniger Construction Company has completed the steel work for the George E Lawrence & Son plant and the walls will be started. The building is to be ready for occupancy by early fall. It will be two stories high with basement and 100 by 142 feet. It will be one of the largest and most modern bake shops in Michigan.

COAL PRODUCTION REPORT

Bituminous coal output for the week ended May 14 totaled 7,937,000 tons, which is nearly 600,000 tons in excess of the previous week's production and almost 1,000,000 tons more than the record of the last week in April. The Department of the Interior says that the increase is due probably to the increasing shipments to the lakes and to tidewater for export. The output of anthracite also showing a goodly increase for the week, the total being 1,938,000 tons, or 300,000 more than for the week of May 7. Carload shipments also show gains. There were shipped from the bituminous mines 148,554 carloads, as compared with 138,032 during the week of May 7, while from the anthracite fields 14,267 went forward 37,063 carloads, as compared with 31,217.

The department's records also give figures on anthracite in storage. On April 1 there was in storage with ten of the largest producers, including tonnage of all the railroad coal companies and the Susquehanna Colliery Company, 1,613,066 tons, as compared with 577,829 on January 1 and 1,110,777 on June 1, 1920.

MARSHALL CORSET CHANGES NAME

The Marshall Corset Company, Marshall, besides changing its name to that of Corset Artistique, Inc., has increased its capital stock from $50,000 to $200,000. Hereafter the concern will make only the highest grade corsets for leading department stores throughout the country. The officers are: H. H. Stiles, president; L. C. Bloomfield, vice-president; George B. Caldwell, secretary, and R. H. Loveland, treasurer.

DETROIT GRAIN ELEVATOR PROPOSED

H. E. Botsford and C. M. Martin have obtained the indorsement of the inland waterways committee of the Detroit Board of Commerce of a plan to build a 2,500,000-bushel grain elevator in Detroit to take care of the needs of the port of Detroit when the Great Lakes-St. Lawrence waterway has been built. Messrs. Botsford and Martin, who propose to organize a corporation to build the elevator, pointed out to the committee that cargoes for ballast were necessary if overseas trade were to be developed, for masters decline to go to sea with only water as ballast.

HUGHES STEEL EQUIPMENT ELECTION

E. L. Koenig, formerly assistant sales manager of J. T. Ryerson & Son, Chicago, has been elected vice-president and a director of the Hughes Steel Equipment Company, Allegan. W. H. Shirley also has been elected to the directorate.

Digitized by Google

Pikes Association Tourists Will Circle Lake Superior

Three hundred persons, a brass band of 40 pieces, a corps of good roads speakers, and a song leader will make the sixth annual tour of the Michigan Pikes Association scheduled to start from Detroit on July 10 on an itinerary covering 1,700 miles and girdling Lake Superior. Eighty motor cars and trucks will transport the party, according to the present plans of W. D. Edenburn, tour manager. With intermediate stops, the expedition will touch the following main points: Detroit, Lansing, Grayling, St. Ignace, Maniatique, Marquette, Crystal Falls, Ironwood, Duluth, Minn., Grand Marais, Fort Williams, Ont., Port Arthur, Ont., Sault Ste. Marie, Ont., Sault Ste. Marie, Mich., Lunden's camp, returning to Detroit by way of Bay City.

This year a tour innovation is to be introduced in the jump from Port Arthur, Ont., to the American "Soo." This will be made by steamer, the "Noronic," Northern Navigation Company's, chartered to transport vehicles and the party across Lake Superior.

At every point where a stop will be made, local committees have been busy for weeks on arrangements to welcome the visitors. Throughout the Upper Peninsula they are looking forward to a big increase in the throngs of motorists who drive through the scenic and resort sections, and the Michigan Pikes expedition is regarded as the greatest possible stimulant in bringing visitors to that part of the country. Applications should be filed with Secretary Willard K. Bush, Michigan Pikes Association, 1220 Book building, Detroit.

A CORRECTION

In an announcement of the opening of a Detroit office by the Joseph L. Skeldon Engineering Company, Toledo, in a recent issue of this publication, the name was spelled "Skelton," which was incorrect. The notice is reprinted to correct the mistake. The new office of the company is located at 1156 Penobscot Building, and is in charge of H. E. Hellman. The company represents the Ames Iron Works, Oswego, N. Y.; Houston-Stanwood & Gamble, Cincinnati; the American Steam Pump Company, Battle Creek, and several other lines. It operates its own machine and pipe shop and does general machine repair work. The company has just finished a power plant for the Monroe Paper Products Company, Monroe, which it designed and built complete, and is installing an addition to the new plant of the River Raisin Paper Company, Monroe.

CREDIT MEN ELECT OFFICERS

Officers elected by the Detroit Association of Credit Men last week are as follows: Murray D. Wasson, Parke, Davis & Company, president; George A. Palmer, Farrand, Williams & Clark, vice president; O. L. Hatt, National Bank of Commerce, treasurer, and W. C. Mitchell, Detroit Stove Works; L. E. Phelan, Smith-Morgan Company; M. B. Williston, United Fuel & Supply Company, and A. G. Baird, Ohio & Michigan Coal Company, directors. The association is twenty-five years old and has a membership of more than 800, being one of the largest business organizations in Detroit.

$40,712 FOR D. U. R. TRACKAGE

On behalf of the city, the clerk of the United States district court at Detroit late last week paid to the Detroit United Railway $40,712.58 for the company's lines in Harper avenue from Gratiot avenue to Montclair avenue. The money came out of the $50,000 deposited with the court when legal action was instituted by the city to take over the lines. The amount was agreed upon by William H. Maybury, appraiser for the city, and Prof. Henry E. Riggs, of the University of Michigan, appraiser for the D. U. R.

A Machine Tool Service Station

In Detroit
where so many Warner & Swasey turret lathes are operating
a Service Staton is imperative,
so we put on at 5928 Second Boulevard.

Two practical men are there to serve you—
Men who know Detroit and its vicinty
and who know Warner & Swasey Turret Lathes,
C. S. Stilwell, Manager, and Wm. B. Pope.

Turret lathes of each size are on exhibit there.
You can buy one right off the floor if you like,
and equip it with tools from the stock we keep there,
or you can buy tools for the machines you have.
Our tools are adaptable to any make turret lathe.

Come and look us over—or telephone us.

DETROIT, SATURDAY, JUNE 4, 1921

The Reduction in Railroad Wages

THE determination of the Railroad Labor Board to authorize a reduction in wages of railroad employes throughout the United States promises to help solve some of the difficulties of railroad management in the United States. The proposed reduction does not entirely take away the most recent advances nor does it disturb the earlier ones which were made under the Adamson act. From the earliest advices of the statisticians it indicates a saving in operating expenses of approximately $400,000,000. This is a long ways from the billion and a quarter that has been added to the operating expenses of American railroads since the beginning of the war in labor costs alone, and the difference between the figures will be answer enough to those who are engaged in the industry who may cry aloud that labor is being oppressed.

As a matter of fact not only in the prices paid for skilled railroad labor, as compared with the compensation of others whose attainments and efforts are of about even value, the railroad men have been overpaid, and most of them know it. In the classification of employment, not only have the patrons of the railroads been wronged, but the skilled employes themselves have been put in a false income position by reason of the payment to casual and handy-men the price of real honest-to-God workers. There have been some very interesting statements put out of casual employes at out of the way places being paid the rates of full time skilled men, though the services of these casuals were limited to but a few movements per day.

The American railroad system is undergoing a transition at the end of which we believe a higher scale of wages will prevail than that which prevailed before the war. It is not likely that the pre-war scale, in terms of dollars and cents, will ever return, for many economic reasons. Neither will the condition which characterized them during the war period in which, whether the policy was a determinate one or not on the part of organized railway employment, the using public, who are the consumers of the railroads' services, believe that the men took an unfair advantage of popular necessity. It is quite certain that organized railway labor has, by its conduct during the war period, lost a great deal of the sympathy which was formerly accorded it. It is reported that votes are to be taken in the associations to determine whether or not the new scale will be accepted, or to whether the associations will strike. If any such coercive measure as the latter is resorted to, it would not be surprising to see the public favor the open shop in railway employment. This we do not believe would be the best thing for the railways or their operatives, but the best thing is not always favored by the public when it gets its "mad" up.

The cut in railroad wages is almost certain to be followed by a partially corresponding cut in railroad income. No matter how mathematically one may figure the income necessities of even a natural monopoly like the transportation system, there is the law of supply and demand to be figured with as effecting the volume of the traffic. Figures of volume can never be forced to remain static. There is a charge which the traffic will not bear, and some of the recently established railroad rates are so high that, added to the cost of the goods carried, they have made marked prices which have discouraged consumption. Already sensible railroad managers are suggesting revisions of the schedules of freight rates. Already, too, we observe railroads resorting to the old time periods and forms of rate reduction, variously described as tourist rates and convenion rates and the like, to help rebuild the volume of traffic which the high rates cut down, and which must be restored if that feature of the railroad service is to be made profitable.

The railroad situation is not yet settled by a long shot, even with the reduction in the wages of railway workers. There are many other nice adjustments to be made yet before the situation is cleared up.

Shall We Subsidize the Farmer?

IT IS REGRETTABLE that the farming interests of the country have made a political issue of their demands for special financial consideration at the hands of Congress, for it means two things: first, that the members of that body will largely divide themselves into two classes, a part dangerously near a majority which will cease to represent the people but will heed the special agents of this newest class combination, and a remainder which will be about evenly divided between dare-nots and malcontents; and, second, that the natural, orderly readjustment of business to normal functioning has got to wait a while longer until the newest stunts are tried out.

It is not surprising that the farmers have got together, for have they not had before them for some years the successful example of Gompers and the labor leaders, and is there not a justifiable feeling amongst them that it is their turn for "pie"? The serious aspect of it all is the dangerous trend of Congress, by yielding to demands of succeeding classes of the people for special financial favors, to make it easy for whomever bands together a formidable enough number of citizens engaged in similar endeavors.

But there is this much good in the present farmer combination movement, *i. e.*, it may mean that their contentions will so absorb the people and Congress that the railroad labor unions at their Denver convention next month will deem it the part of wisdom not to stir up a new railroad labor rumpus while the farmers have the whip seat, Congress manifestly being unable to please both at once.

The elbow room which we have in this confederation of states is one of the greatest safety valves in the world against domestic revolution. If a man doesn't like his job in Kalamazoo he can get one in Keokuk by a little bestirring, and if he who runs a corner grocery in Muskegon becomes dissatisfied with his lot he can still obtain land in Montcalm or Mason, so that we haven't the fears of social troubles such as bother the statesmen in England and France with their highly congested areas. But the same elbow room opens a door to a series of political exploitations of one class by another, according as each class gets itself organized and advertised and puts its agents at the throats of the legislators ahead of the other classes. We are witnessing a cycle of class exploitations now. The farmers propose that the Government lend up to 75 per cent of value of staple crops—they have already the farm loan banks—but do they stop to consider whether the Government has money to lend? And second, if it can lend money, from what sources do the funds come?

We have often referred in these columns to the fallacy of trying in finance to make water run up hill, and with every recurring effort by special agents of new classes to obtain favors at Washington the figure of speech comes quickly to mind. Thus again we have a set of people proceeding on the theory that down in

Digitized by Google

Washington there is a charmed source of money which will flow merely by legislative act. If the farmers have not overlooked the fact that the funds of any government are obtained by taxation or borrowing, and that in the end all comes from taxation, they are asking this special aid with knowledge that all the people are going to be taxed for their special benefit. We wonder whether there would be the same zeal for government help if all the taxes necessary for the job were raised solely among farmers. We think not, for if any one has had experience with assessing and collecting taxes in the farming districts he will recall how speedily every proposed public expense is traced straight to the assessment roll long before the proposition comes up for vote. But if the cost can be shifted to someone else or the process of collecting is indirect, so that the farmer does not get a picture of paying out more at tax time, he is ordinarily in favor of the proposition.

Therefore, it is at this point that the business of the country finds itself today. There is no more equity, for instance, in taxing the people of Detroit to provide special loan accommodations for the farmers of Clinton county than there is in the reverse operation, unless it is the will of all the people to subsidize the farming business. It would be precisely as fair to levy taxes on all the farming land of the nation to provide a fund for special help for the multitude of corporations which have passed their dividends, unless it were the will of all the people to subsidize the industrial interests. A subsidy in theory is set up only because there are common benefits to all citizens.

Instances are rare among farmers who fail where any are left without slender means, at least, with which to start up again. Even during the lean years 1910 to 1914 in North Dakota, where accumulations of debt forced many of the farmers, after four successive crop failures, to hold auctions for the purpose of paying up, most of the unfortunate ones came out with at least credit enough to retain a team of horses and a few implements. And where their honesty has not been questioned there is usually a chance to rent land on favorable terms. On the other hand, consider the merchant or manufacturer who is forced to clean up. The story does not run the same.

We do not think that the rank and file of the farmers want any special favors. We believe that all they want is a fair chance to get their goods into a fair market. But the farmer, like the union labor rank and file, has been taking unwise counsel from those who are in it to make fat jobs for themselves and who are telling wonderful tales of the green valleys of profit that lie ahead of those who do their biding and espouse their quack theories. The thing cannot be stopped by heaping abuse on the farmer, for that only makes him more blindly obstinate; but we can take care that the farmers in our own backyard get "a fair shake." In so doing we will gain his confidence. Once he is shown that the big business of a single city is willing to go half way, he will spread the gospel to his brothers all over the nation without high priced organizers for his mouthpiece, and normalcy will return without government help.

The Income Tax

AS this paper goes to press the house of representatives of the Michigan legislature haas affirmed the recommendation of an amendment to the state constitution providing for an income tax. Whether the senate will pass the joint resolution for the submission of a constitutional amendment on the matter or not we are not at present advised. Whether it does or not, there is the greatest likelihood of the submission of such an amendment by petition.

Michigan's public sentiment with regard to accumulated wealth and organized capital has never been as radical as that of Kansas, before Kansas got wealthy, or even as that of Wisconsin during the palmy days of unrestrained Lafolletteism. But there are terms and phrases which creep into public discussion which sometimes lead the people to fear that there is an antagonism to the accumulations of initiative and thrift which would, if it could, express itself in legislation which would tax accumulated wealth out of existence. We do not believe that this sentiment is by any means in the majority of the voters' minds; but we do believe that the majority is not fully awake to the dangers of the application of an income tax in this state.

To begin with, the income tax has been very generally set apart by tax economists as a source of supply of some of its funds to the federal government, and its duplication by the state governments has been feared as leading to a further extension of inquisitorial methods and a further inroad upon the results of industry and commercial activity. In Michigan the income tax theory has been advanced for the very frank purpose of relieving the agricultural land owners of their share of the burden of state taxation and of laying it on industry. A very plausible statement is made that even if the impost seems rather unjust to industry at first, it will adjust itself in the long run, the agriculturists paying their share as consumers of the products of industry. This is very far from being an accurate statement. Michigan stands sixth among the American states in industry today, which means that six leading states in the United States are competitors for the trade of the rest of the country and of the world. The conditions in each of the states have some peculiar advantage for industry. In New York, Massachusetts and Pennsylvania the advantage is that of ready access to raw materials brought in by sea and to the markets to which the open sea is the way. To Michigan, Ohio and Illinois their locality in the center of population and distribution and their access to readily transported coal are the general advantages. Special ones exist in the way of railroads, labor and tax legislation. They are very nearly in equilibrium. Were Michigan to put her industries out of equilibrium in competition with the industries of the neighboring states it is not hard to see how readily they can be moved into territory in which the disadvantages would not exist.

The income tax is a direct thrust at industry, and as such our industrialists owe it to their enterprises and their employes to begin an active campaign of education against it. The people should at least be given the chance of knowing what results may accrue from the things they are asked to vote for.

Short Measure Stuff

TABLE MANNERS IN NEWPORT AS SEEN BY IONIA

(From the Ionia Sentinel-Standard)

Word comes from a woman formerly of Ionia, who knows a swell society woman, who visits a sister, who has a cottage at Newport, the dining room tables, which for years have stood in the dining room are no longer used by those of the "upper cretes." It seems the old fashioned table with drop leaves is placed against the wall in the dining room. When the time to serve the meal comes the butler, or whoever it is, lifts the table to the center of the room, sets it, and after the family is seated, a waitress passes the dinner. Also buffets, which followed the old-fashioned sideboards are no more. The family silver hides its grandeur in a closet and is no longer set forth on the dining room buffet. It is used when necessary in serving a meal, and at other times is out of sight.

FINANCIAL

Some Thoughts Brought Home From Scandinavia

By PHIL S. HANNA

IT IS ALWAYS interesting to learn how others look at us. The observations of a representative of the Irving National Bank, New York, just returned from Sweden and Norway gives a fair picture of what part of the world outside the boundaries of these United States think of our efforts toward business readjustment, particularly the tariff. The Irving investigator says that business men in all the Scandinavian countries follow every change in American affairs with utmost interest and that whatever happens here is taken over there as apt to have far reaching effects all over the world. Such are the emoiments of the party to a free-for-all who comes out unscathed, comparatively.

It will be a long time before New York becomes the actual financial center of the world, although it is now the potential center. But changing the world's money center from London to New York will come only as a result of making the latter the world's center for settling trade accounts; and we cannot accomplish this without having goods moving both ways in and ont of New York in greater volume than they move in and out of London.

Thus in the Scandinavian countries it is not surprising that this representative found much amasement at our recent steps to establish a tariff. They argue over there that since Scandinavia has taken all the goods from the United States that their people can absorb, the erection of a tariff against their goods is simply a notice that we do not wish to continue trade with them. it is true that countries with depreciated currency, and exchange running against them, are aided by the premium which their exports bring when sold for dollars, but these gains are more than offset by the discounts they have to pay on their imports if the latter are greater than exports; and at best the advantage is a constantly diminishing one as exchange improves.

The former unity between the Scandinavian countries seems to have been broken up, as Mr. Lindhjem says, "by the rates of exchange and dissimilar commercial conditions have created new problems and now each country is working out its own salvation. To some extent they are competing with one another." in this connection we note that exchange on Sweden is now .2350, as against a par of .2680, or a discount of about 12 per cent, while that on Norway is .1610, as against a par of .2682, or a discount of 40 per cent.

But here is another thought in relation to this matter of a tariff. It will be interesting as the new tariff is tried out to see whether it is going to accomplish under the changed conditions what it accomplished formerly. When we were in debt to Europe four or five billions of dollars and when the difference between the cost of production here and the cost abroad was only one-half or one-third of its present width, the tariff worked nicely, but with the tables turned—Europe in debt to us fifteen billions and the difference in cost of production varying from two fold in England to twelve fold in Germany—is the tariff going to do the trick again? It is the first time in the history of these United States that we have faced a situation composed of factors which are new and strange. And while a poor pian well administered is better than no plan at all, should one blindly place his faith in the efficacy of an old prescription when the patient has developed so many new and unfathomed symptoms in combination with the old ones?

* * *

There is no topic in our minde which has brought out conflict of opinion like the subject of the price cuts in automobiles and its first cousin, whether the cuts are going to stimulate business and keep orders coming in. It cannot be said that the daily press has failed to co-operate with the industry; glowing reports of re-employment and cheerful construction of had news was freely indulged in all through the low period of last winter and some facts of a discouraging nature concerning factory conditions of the last three or four weeks were carefully avoided until an insurgent newspaper let go. So that insofar as publicity is a factor in determining sentiment, the motor industry has had the edge going and coming.

But murder will out eventually, and it were much better to retain the public's confidence permanently than to gain a small portion of its money temporarily. The cuts are proper, should have been made sooner (but never will that) and should the great majority of the manufacturers will be in line, and there will then be some surprises in store for the pessimists. Just as some retailers have closed shop, there will be some car builders disappear, but the industry of making motor cars is no more apt to be crushed than the industry of supplying water power when prices get down to a basis where the buyers have confidence again, we shall find an agreeable amount of business.

DURANT STOCK LISTED

Further recognition of Detroit as the motor center of America is indicated in the application of Durant Motors, Inc., for the listing of its common stock on the Detroit Stock Exchange. The application has been approved by the board of governors and the issue is expected to become one of the most active traders on the board.

In his application the company indicates that it has authorized 1,000,000 shares of common without par value and of this number there were outstanding 507,057 on the first of this month.

The following balance sheet as of May 2 was submitted:

Assets	
Cash on hand	$ 800.00
Cash in banks	389,760.46
Accounts receivable:	
Other accounts receivable	217,797.22
Stock subscriptions unpaid	5,000,491.29
Deferred charges, prepaid expenses, etc.	2,332.32
Plant:	
Machinery	11,259.79
Patterns and drawings	44,000.10
Other Assets:	
Marketable securities listed on New York Stock Exchange at cost price	2,502,139.41
Organization	78,557.02
	$8,357,651.70
Liabilities	
Common stock outstanding	$5,232,274.00
Common stock subscribed but unissued	2,126,350.00
Notes Payable	
Other account payable	27.70
	$8,357,651.70

The officers and directors of Durant Motors, Inc., are as follow: William C. Durant, president and director, 1780 Broadway, N. Y. C.; Carroll Downes, vice-president and director, 511 5th ave., N. Y. C.; W. W. Murphy, treasurer and director, 1740 Broadway, N. Y. C.; H. F Herbermann, secretary and director, 43 Cedar st., N. Y. C.; C. E. Healy, director, 2 Rector st., N. Y. C.

The company's proposed office is in Wilmington, Delaware. In view of the many rumors and the speculation regarding Durant Motors proposed activities it is interesting to note that the articles of incorporation say that it shall be the business of the company to not only manufacture and sell automobiles and automobile parts, but also to hold the securities of other corporations.

The issue has been approved by the Michigan Securities Commission. Durant Motors, incorporated of Delaware, is the parent organization of the Durant companies being organized in various cities. The stock went on the board of the Detroit Stock Exchange Tuesday, May 31.

D. U. R. REORGANIZATION

It was announced late last week that Alex Dow, president and general manager of the Detroit Edison Company, and Harrison Williams, of the Central Union Trust Company, New York, had been elected members of the board of the Detroit United Railway, following the resignation of Frank W. Brooks as president of the corporation. It is reported that there will be a reorganization of the management. Allen F. Edwards, vice-president and treasurer of the company, is mentioned as the probable successor to Mr. Brooks.

FISHER BODY OHIO EXCHANGE

Under a plan now being put into operation, holders of common stock (ten-par value) of the Fisher Body Ohio Company are to receive a bonus of $3 a share for their holdings, as well as one share of Fisher Body Corporation (New York) stock for each five shares of Fisher Body Ohio common.

Where holdings of the Ohio company stock are other than in multiples of five shares, holders will have the privilege of selling the odd shares or purchasing enough more to bring their total holdings to some multiple of five—that is, a person holding seven shares may exchange five of them for one share of the New York company and then either sell the odd two shares or buy three more.

The Fisher Body Corporation, New York, already owns approximately 55 per cent of the common stock of the Ohio company. Recent market quotations on the New York company stock are in the neighborhood of $90 a share.

The Security Trust Company, Detroit, already acting as transfer agent for the Fisher Body Corporation, has likewise been selected as the fiscal agent to handle this exchange.

WALSH TO SELL DURANT STOCK

John H. Walsh has been appointed sales agent for the stock of Durant Motors, Inc., and has opened offices in Lansing, according to announcement by G. N. Murchey & Co.

GENESEE ROAD BONDS UNSOLD

Supervisors of Genesee county concluded their session May 26 without accepting any bids for $850,000 of road bonds advertised for sale.

FIRST NATIONAL BUYS BONDS

The State Administrative Board has accepted the bid of the First National Company of Detroit for all of the new $3,000,000 worth of highway bonds, paying a premium of $21,540 for them. These bonds draw five and a half per cent interest. One million dollars worth of old bonds bearing only five per cent interest were burned. This makes a total of $10,000,000 worth of the highway bonds now sold. The First National and other concerns have indicated they would invest heavily in soldiers' bonus bonds. The state will arrange for registered bonds to be given in exchange for coupon bonds, if purchasers want them. These registered bonds will be for $10,000 each, taking up ten of the $1,000 coupon bonds.

PAR COLLECTION LITIGATION

Par collection opponents drew first blood by reason of the recent supreme court decision but the issue is a long way from being settled thereby. The effect of the decision is to return the case to the district court of Georgia for further hearing.

Business Meets New Conditions

American business has been clearing decks. Budgets have been revised. Every buying, selling and production unit has been overhauled and made ready for intensive service. Economy has been the test—economy of time and effort.

In any study of functions and readjusting of methods, the work done by your bank balance should not be overlooked. Has it been merely a checking account and a basis for commercial credit? Or has it brought to the aid of your organization other constructive services? Are you making use now of all the help it should provide?

Many business men who carry deposits with the Irving or with Irving correspondents have discovered broader service possibilities in their banking connections The Irving investigates markets as well as credits, expedites deliveries of merchandise as well as collections, supplements the information resources of its customers both in domestic and foreign fields. Every transaction it undertakes, either at home or over-seas, is handled with a clear understanding of business essentials as well as careful attention to banking requirements.

Has Prudence Fled?

Do you expect to die bankrupt? We don't expect to, but we do,—two-thirds of us according to the figures.

It is a matter of record that in the United States 66 out of every 100 people who die leave no estate whatever. Of the remaining 34, but 9 leave estates larger than $5,000, and the estates left by the other 25 average a little less than $1,300.

Now, good bonds or the cash proceeds of your life insurance policies,—in fact any lump sum, placed with us IN TRUST, will have a tendency to PREVENT POVERTY. The earlier it is begun, the more time it will have to grow.

Adopt this strong Trust Company as your Trustee.

THE MICHIGAN TRUST COMPANY

GRAND RAPIDS, MICHIGAN

7% FARM DRAINAGE BONDS 7%

There is no better Security on earth than Tax Liens on Cultivated Farms.

Ordinarily FARM DRAINAGE DISTRICT BONDS pay the investor Six Per cent, but for quick sale, we offer ten choice issues to pay from 7% to 7½%. Interest payable annually or semi-annually by coupon collectible at your bank.

They come in $1,000, $500 and $100 denominations, and run from Three to Twenty years and are FREE OF ALL FEDERAL INCOME TAXES.

Upon Postal Card request, we will send Circular No. 1963—"A Few Reasons Why Farm Drainage Bonds Are So Highly Regarded."

Interest is falling. Buy High Income now for future years!

Michigan Bond Items

Three million dollars of Michigan highway 5½ per cent gold bonds dated June 1, 1921 and maturing June 1, 1941, are being offered by the First National Company and Detroit Trust Company, Detroit. They are coupon bonds in denomination of $1,000 and are issued subject to the approval of the attorney general. The price is $102.56, yielding about 5.20 per cent. The First National Company purchased the bonds late last year, paying a premium of $21,540.

On orders of the state treasury, $1,000,000 of Michigan highway bonds were burned late last week because it had been found impossible to sell them. They bore interest at 5 per cent.

The Kent State Bank, Grand Rapids, has taken city filtration and water bonds amounting to $250,000 which were sold to Eldredge & Company, New York, at a premium of $8,025, says the Grand Rapids Press, which adds: "On the $100,000 filtration bonds accrued interest already amounts to $1,134.68. These bonds have been under record of sale for 85 days, and bring the city $12,70 a day pendine liquidation. The company, however, will get a return in interest at 5 per cent on filtration and 6 per cent on water bonds. The $150,000 of water bonds have been running under sale for 21 days at $21.66 a day. The accrued interest amounted to $591.87. The premium on the water bonds was $3,210 and $4,815 on the water securities.

Voters of Grand Ledge have decided in favor of bonding the town for $11,000 to pave North Bridge street and in favor of issuing $10,000 of bonds to build a dam.

Traverse City has sold $250,000 of bonds to the First National Bank of that city, which agreed to pay a premium of $7,525 in addition to accrued interest to date of delivery. The money is to be used for the construction of a dam.

SEYMOUR EXTENDS ACTIVITIES

D. L. Seymour & Company, 1649 Penobscot building, has opened a department to handle expansion issues in rooms on the sixth floor of the building. Walter P. Haier and Thomas K. Wright are in charge of the department.

HOLLAND-ST. LOUIS SUGAR

The three factories of the Holland-St. Louis Sugar Company, Holland, sliced 195,293 tons of beets and packed 46,051,000 pounds of sugar last year, it is announced by M. McLean, manager of the company. The total amount paid farmers for beets was $2,135,770. Total acreage harvested during 1920 was 21,414 acres, while for this year 21,765 acres have been contracted for.

N. Y. C. HAS $6,530,000 DEFICIT

For the three months ended March 31, 1921, the New York Central Railroad Company reports gross earnings of $7,344,559, a decrease of $3,039,599 as compared with the first three months of 1920. After provision for taxes and charges had been made there was a deficit of $6,530,000, as against a surplus of $4,427,753 a year ago.

CANT CUT FUR THE PRESENT

Alex Dow, president and general manager of the Detroit Edison Company, says it will be impossible, at least for the present, for the company to reduce its rates for light and after the increase will be $500,000.

power as requested by the mayor of Detroit. The heat rate, Mr. Dow added, probably will be cut. This charge was increased last October and the new schedule probably will go into effect July 1. The Edison Company, Mr. Dow said, was only now recovering from the losses it suffered during the war and in 1919.

TO ADD $100,000 TO CAPITAL

The City National Bank, Battle Creek, formerly the City Bank, of which E. R. Morton is vice-president and cashier, has announced that its capital stock will be increased from $250,000 to $350,000. Combined capital and surplus after the increase will be $500,000.

ATLAS STOCK SETTLEMENT

When the Atlas Tractor Company planned to locate its plant in Adrian stock was sold to Adrian residents. Later the company decided to build the plant in Belleville although trenches for the foundations had been dug in Adrian. Now fifteen Adrian stockholders are seeking a settlement with the company.

EATON RAPIDS BANKER DEAD

Herbert H. Hamilton, former president of the Michigan State Bank, Eaton Rapids, and first mayor of that city died Thursday, May 26. He was 73 years old and had lived in Eaton Rapids 54 years.

Union Carbide Will Make Public Financial Statements

According to The Chicago Examiner, the Union Carbide Company has voted to issue periodical financial statements and to take the public in its confidence. It will come as a distinct surprise to those who have been in touch with this situation. Not since the company was organized in 1898 have many outside of the board of directors known the particulars of the company's finances. With this announcement the company made public a balance sheet as of March 31, 1921, which follows, and reduced the dividend from $1.50 quarterly to $1. Michigan is interested because of Carbide's ownership of the Michigan Northern Power Company and the large carbide plant at Sault Ste. Marie.

The certified consolidated balance sheet, as of March 31, 1921, after elimination of intercompany stock ownership and intercompany accounts, follows.

Assets

Cap. stock, Union Carb. & Carb. Co., consist. 2,656,817 shares, no par val.	109,023,719
Surplus	65,275,493
Total	$212,049,521

The Union Carbide & Carbon Corporation owns directly or indirectly substantially all of the common stock of the Union Carbide Company, National Carbon Company, Inc., Linde Air Products Company, Prest-o-Lite Company, Inc., Electro-Metallurgical Company, Oxweld Acetylene Company and controls the Michigan Northern Power Company. Union Carbide Company of Canada, Ltd., Electric Furnace Products Company, Ltd., the Oxweld Railroad Service Company, Haynes Stellite Company, Dominion Oxygen Company, Ltd., and other companies. As of May last year the company controlled a total of thirty-three companies.

There is probably no open stock company in the world about which so little definite knowledge has been circulated as the Union Carbide & Carbon Corporation. Its stockholders have never been permitted to peek behind the scenes no matter how large their holdings. Seven sons of the directors, it is said, have been kept in ignorance. Estimates of the company's earnings have been many and widely at variance.

Those who have purchased the stock have bought blindly. At the same time, however, they have prospered, as Carbide is one of the few mystery stocks that has delivered results. There is probably no stock in the country that has made so many Chicagoans millionaires as the stock of this corporation. The stock has book value of $65.50 per share.

CHECK ALTERATION INSURANCE

It is estimated that the loss of money through forgeries and check alterations in 1920 amounted to $50,000,000, an increase of $15,000,000 over the preceding year and $27,000,000 over 1912. Various types of check writing and protecting devices have been invented and are used extensively, yet crooks manage to ply their criminal trade successfully. The bank is fairly well protected by law, but the depositor is not.

To provide protection against loss for the depositor check alteration insurance is being issued by the Detroit Insurance Agency. This insurance covers alterations of the check number, date, amount, payee, signature and indorsement, guaranteeing a return of the amount lost through forgery or check "kiting," as provided in the policy. The premium on a thousand dollars has been made small so that it is not a burden.

HALSEY-STUART PARTIAL PAY PLAN

To accommodate the increasing number of bonds buyers who desire to make partial payments, Halsey, Stuart & Company have issued a booklet describing their partial payment plan. The plan calls for a 10 per cent down payment on any bond selected from the company's list of bonds in existence. Monthly payments of at least 10 per cent of the balance in the ten succeeding months. Payments are receipted for on a card which is quite similar to a savings account book and interest is allowed at the rate of 6 per cent from date of receipt to the date of final payment.

LANSING PROPERTY LISTED

The Lansing Real Estate Board has adopted the multiple system of listing, giving all dealers the value of each property listed. A permanent secretary will be employed.

STRAUS OCCUPIES NEW HOME

After ten years in rented quarters the investment house of S. W. Straus & Company, New York, has erected an office building of its own at the corner of Fifth avenue and Forty-sixth street, which it moved into June 1.

KAZOO CREDIT MEN HEAR ALLES

E. R. Alles, treasurer of the Detroit Steel Products Company and president of the Detroit Association of Credit Men, was the principal speaker at the meeting of the Kalamazoo Association of Credit Men, Park-American Hotel, Kalamazoo, May 25. His topic was "Credit Granting," a practical discussion of credits from the standpoints of the wholesaler, manufacturer and Jobber.

FLINT FARE GOES TO SIX CENTS

The common council of Flint last week gave the D. U. R. permission to increase its city fare to six cents from five cents. The request that jitney competition be eliminated was left for future consideration. The increase was granted as the result of the report of an investigating committee headed by Prof. H. E. Riggs, of the University of Michigan, showing that the company was operating at a loss.

MANISTEE RATE INCREASE

The request of the Michigan Light Company to increase its charges for gas has been granted by the Manistee city commission. The maximum charge is now $2 and the minimum charge $1. The 50-cent service charge which had been the object of much criticism has been abolished.

DETROIT EDISON REVENUE INCREASED

Gross revenue of the Detroit Edison Company for April amounted to $1,913,604.93, an increase of 28.5 per cent over the preceding April. The net income was $493,261.96, an increase of 130.6 per cent. The balance after all deductions was $221,555.46, an increase of 548.6 per cent over that of the same month in 1920.

Banks and Bankers

NEW BANK HOMES PROGRESSING

Among Detroit's new building to be shown visitors to the convention will be the new home of the Detroit Savings Bank, the new Continental Bank and the half-completed First & Old Detroit National Bank buildings. The delegates will find much of interest in visiting the new quarters of these institutions. The remodeling of three floors of the old Chamber of Commerce building into one of the most modern banking rooms in the country has taken about a year. The quarters occupied by the new Continental Bank, Broadway, are unique, and the progress of the work on the new building of the First & Old will be a surprise. Viewed from the river boats the 24-story building stands out prominently adding substantial "tooth" to the sky line of downtown Detroit.

MORE ROOM PROVIDED

Rapid growth in the business of the National Bank of Pontiac, which was organized but seventeen months ago, has necessitated a rearrangement of the office space to enable the larger clientele to transact business with comfort and convenience.

The women's rooms and the private consultation room at the left of the front entrance have been removed, and an additional space of about ten feet is being arranged for bank officials.

The directors' room at the rear of the building, will henceforth be available to customers who desire space for private consultations and a desk and bench for women customers has been provided at the front of the building.

In the seventeen months the bank has been doing business the total assets have risen to $2,000,000 and the deposits have mounted to $1,400,000.

DOUBLING ITS CAPITAL

The board of directors of the First State Bank of Royal Oak has voted to increase the capital stock from $50,000 to $100,000. The bank was organized in 1913 with a capital of $25,000. This was doubled in January, 1920.

VALLEY CITY BUILDING & LOAN

The annual report of the Valley City Building & Loan Association, Grand Rapids, shows that total receipts were $254,688. Total assets are $336,903, of which $303,242 is in loans. The outstanding stock totals $163,355 advance payment and $131,129 dues. Officers for the coming year have been elected as follows: President, Herman Van Aalderen; vice-president, Glenn C. Mason; secretary, J. Langdon McKee; treasurer, John P. Otte. Directors are the officers and A. C. Bodelack, C. U. Clark, Clayton Fuller, C. J. Kuennen, Harry Thomasma, A. J. Latte and Martin Pijenbrook.

BANKERS' BANQUET IN FALL

The executive committee of the Bankers' Club of Detroit has decided to defer until November the banquet which was scheduled for May 9 at which Sir Eric Geddes was scheduled to speak. It is hoped Sir Eric will be able to address the fall meeting.

SMITH GOES TO CHARLEVOIX

Leo Smith, for some years assistant cashier of the First National Bank, Boyne City, will become assistant cashier of the Charlevoix State Savings Bank June 1. He will succeed Archie Livingston, who became cashier of the Charlevoix State when A. D. Crimmins left the bank to become cashier of the Grand Rapids National City Bank.

CONTINGENT LIABILITY

The Compensation Act provides that payment of compensation for death and certain kinds of long term disability, may be made in installments over a period as long as ten years.

So until all payments due on such claims have been completed there is a contingent liability upon your part. If the insurance company fails to complete them, YOU must.

Only when the full payment has been actually made can you possibly be released from this contingent liability.

To relieve its members of every possible element of chance—to assure them of absolute protection—the Michigan Mutual very early in its history, adopted the plan of discharging all liability on these long term payments by payment in advance.

When a claim of this kind arises under a Michigan Mutual policy, the full amount due is deposited with one of the largest Trust Companies to the credit of the claimant, who may then draw on this account weekly until the full amount of the claim has been discharged.

Upon all such deposits the Trust Company gives a receipt which, under the Compensation Act, automatically relieves both the policyholder and the insurance company OF ALL FUTURE LIABILITY.

The advantages of this plan to the compensation insurance buyer should be plainly apparent. Much may happen in ten years—the longest term of payment. Even seemingly strong insurance companies may meet with reverses impairing their solvency and if this happens the responsibility for completion of the unpaid installments will be thrown back upon the policyholder, perhaps at a time when it would be a great burden for him to assume them.

Avoid this chance. No matter how remote it may seem it still is a chance—an unnecessary chance as it can be absolutely eliminated by carrying your compensation insurance in the Michigan Mutual.

Other companies promise to pay at a future time—the Michigan Mutual pays NOW, relieving both you and itself of all future liability.

Let us tell you more about this and other advantages of compensation insurance in this company. Write now—a postal will do.

Every policy is non-assessable. Every policy shares in savings.

Mixing the Ounce of Prevention

(Continued from Page 8)

say that only three measures were passed in the last session that affected the state's industries. One of these was the Corporation Franchise Fee Law. Another was the revision of the corporation laws of Michigan. This bill was advocated by the Association and we followed it closely. It permits the issuance of non-par value stock, removes the limit on total capitalization, simplifies the law and eliminates that section requiring the filing of names of stockholders with the Secretary of State. It will bring into the state fees paid by foreign corporations into other states.

"This act also provides for the issuance of a special preferred stock known as industrial welfare stock, which can be sold to employes. This clause was asked by corporations desiring to issue stock to their employes as rewards for their industry and long connection with one employer.

"The third bill was the amendment to the compensation act. This bill came before the House so drafted as to provide for an increase in the percentage of weekly payments from 60 to 66 2-3 and an increase in the maximum weekly payment from $14 to $20. It provided for a definition of an accidental personal injury that would have covered almost any kind of injury, and in some cases no injury at all. The definition was too broad. Facial disfigurement was provided for, whether or not such disfigurement impaired the worker's efficiency. It was the complete program of the Federation of Labor on the compensation law.

"When the bill was passed it provided only for $200 funeral expenses and an increase in the total disability payment from $6,000 to $7,000. These are the only two sections affecting the manufacturer. A clause was added to put sub-contractors under the act, and another providing for the protection of workers injured outside of the state.

"While all the credit for saving Michigan industry from such burdens imposed by any or all of the 160 bills introduced cannot be assumed by the Association, it is generally recognized that there been no association, or had the Association been less active and efficient, the result would have been much different. Credit must be given those who have shown more interest in the state's welfare than in such glory as they might have gained for themselves, but, on the other hand, so long as industry or any other division of the state's population cannot hope to, or want to reserve the whole legislative representation for itself, the legislature having an honest desire to serve all classes fairly are entitled to information and opinions by which they can decide what legislation to support and what to disapprove. The function of an association is to impart this information and plead its case on its merits.

Some of the Bills

Mr. Lovett's digest of some of the bills introduced, which should bear out the preamble to this article, follows:

"Under the head of general legislation, the bill repealing the act creating the Michigan State Police died in committee, and this organization became a part of the Department of Public Safety. This department consolidated the liquor enforcement, food and drug and oil inspection departments and saved for us the state police.

"The full crew train bill, which could have increased the payroll of Michigan railroads at a time when a reduction in cost and in freight rates was most urgent, was killed in committee. Right here I might mention the fact that the agricultural members of the House appeared to be opposed to the major part of the labor measures. On the other hand, the farmers were favorable to most of the taxation measures. Bills prohibiting cost-plus contracts and approving the Great Lakes-St. Lawrence waterway project were passed. A bill creating a commission to regulate the use of sprinkler heads in fire protection was defeated.

"The Association is not looking after the interest of any one class of industry, but for all industry, and often a measure may be brought forward, which, while it affects but one type of manufacturing, nevertheless contains a principle in which every class of manufacture must be interested. For example, a bill to regulate the manufacture and sale of wire fence was introduced, and as originally drawn provided a jail sentence for any manufacturer of wire fence in the state who had a variation in a gauge of wire and galvanized coating of more than .003 of an inch. You may laugh, but this bill passed the Senate. Nothing short of a lengthy hearing before the agricultural committee of the House, in which wire fence manufacture was traced from ore to the fence on the farm, defeated this bill. It took the farmers to do the trick. It may be that a bill having so much as the interest for you but it does not directly affect your industry, but you must bear in mind that if is just as easy to introduce a measure against your business, which has less merit. Take the coal bill, for instance. It provided for a standard test for domestic coal and was an attempt to regulate every coal dealer in the state, although none of the coal was produced in the state. This measure was in general orders in the Senate before the senator who fathered it withdrew it.

"There was a conditional sales bill which would have had the effect of making sales business with legal tape that a man in that business would have had to have a lawyer sitting at each side of his desk. The measure passed the Senate but lost out in the House judiciary committee. Our packing house members were affected by attempted legislation requiring that interest for years be stamped on all ham and bacon packages. This measure passed the Senate but was defeated in the House. Considerable excitement was created by the bill which would have required that the weight in ounces of each co-stituent part be stamped on almost every product manufactured in the state, but it did not survive.

"Some bills introduced were the result of afore-thought, others from lack of knowledge or business judgment. The measure to prohibit the payment of commissions on materials furnished the state is an example. The proponent did not realize that if every firm had to maintain salesmen on a salary at Lansing it would cost more money than the payment of commissions. He believed that this would save the money being paid to salesmen. He did not know the state bought on contract only.

"The automotive industry was selected as a target for considerable legislation. One senator desired to tax driveaways to the tune of $3 each, which meant that every Michigan automobile manufacturer whose car was driven away would have to pay $3 for the privilege, which was $3 more to be levied against the right to manufacture cars in this state than in any other state. The obvious discrimination against our leading industry killed the bill.

"The 5 per cent tax on gross earnings of motor truck companies provided in another bill was a thoughtless attempt to wring tribute from the industry. It was tabled while the framer of it was out of the room. The Highway Department was behind this bill, and it was admitted that the idea came from an article in a national magazine, which told of such a law in California. The House roads and bridges committee had a bill providing for a tax of one cent a gallon on gasoline. What could be more unfair than to attack the industry that has made Michigan the automotive center of the world?

"The measure requiring rear-view mirrors on motor trucks used outside the city became a law. We were in favor of a bill compelling drivers of all animal-drawn vehicles to attach lights to them, and it was passed with the proviso that hay wagons were to be exempted.

"Then we had a veteran of the Civil War come down from up-state who had a lot of new ideas about legislation. Once he owned an automobile and became to believed that a garage over-charged him for repairs he introduced a couple of bills, one of which provided for the licensing of garages and service stations and mechanics employed in them. His argument was that he had taken his car to a service station where he was told the cost of work to be done would be $10, but when he went after the car the bill was $50. He was determined to get even by exercising his legislative powers.

"There are two kinds of legislation, class so-called legislation desired by some particular group of farmers, labor unions or manufacturers, and personal grievance legislation. When the promoters of such legislation begin work the bills come along in stacks on Monday or Tuesday.

Hours-of-Employment Bills

"The eight-hour bill for male employes was introduced, as usual, but drew only eight votes, one for each of the eight hours. An attempt was made to place a bill prohibiting manufacturers from taking photographs and fingerprints of employes, the incentive for which was the Ford-Communist antagonism for the mining interests. It was said that the fathers of the drafting measures against industrial interests was the outgrowth of resentment against prohibition, which killed the sale of the brewery business. Another example of personal grievance legislation was the bill prohibiting employers from discharging workers who had been injured because of negligence in a factory, which was fathered by a member who had a relative discharged for this reason.

"One legislator introduced a 58-hour bill for women workers, but after he found the state already had a 54-hour bill for women, he requested from the floor of the House that the bill be tabled. A bill to repeal the specific tax on [illegible] per cent, a tax of one-half of one per cent., passed the House, and if it had become a law would have put all foreign securities on the ad valorem list to take a tax rate of about 3 per cent, depending upon where you lived. It did not come out of the Senate committee on banks and corporations.

"Two income tax measures were introduced, one in the House and one in the Senate. The first one was a resolution calling for an amendment to the constitution, which in its original form would have provided an income tax on corporations, with graduations, exemptions and reductions, and it would have required the legislature, if the people had voted on it in its original form, to pass such a law as was set up in this amendment. It lacked three votes of passage, whereupon it was tabled for three or four weeks, when an amendment was offered exempting corporations and eliminating all the deductions, exemptions and graduations. The measure, as it passed the House, provided only for a flat income tax on gross earnings without corporations being included.

"The farmers were divided on this proposition and it was killed in the Senate committee. In the Senate a measure to operate under

Digitized by Google

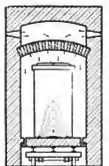
the present constitution provided a tax of one-fourth of one per cent on incomes from nothing to $5,000; from $5,000 to $10,000, one-half of one per cent; from $10,000 to $40,000, three-fourths of one per cent; from $40,000 on, 1 0 per cent was introduced, but was declared unconstitutinal."

Mr. Lovett might have gone on and reviewed the whole 160 hills but what he has said seems sufficient to show why the Michigan Manufacturers' Association has won its "block letter" and is growing in membership. Also it ought to be sufficient argument in favor of more attention to politics by the manufacturers of the state. It seems likely that more will be given in the future. At any rate, a strong list of officers and directors has been named for the ensuing year, and the newly elected men are as energetic and progressive as were those who retired. Frank C. Whitney, secretary-treasurer of the Muskegon Motor Specialties Company, is the retired president, and it was under his leadership that the Association made such remarkable progress. During 1920 there was added 208 new members, which brought the total increase in membership since 1919 up to 500.

The New Officers

The new president is F. W. Hutchings, vice-president and treasurer of the Charcoal Iron Company of America, Detroit. As secretary of the National Founders' Association Mr. Hutchings built up its membership and influence until it became one of the leading open shop organizations in the country. The vice-presidents are A. B. Williams, secretary of the Postum Cereal Company, Battle Creek, and C. E. Bement, vice-president and general manager of the Novo Engine Company, Lansing. The treasurer is M. J. Murphy, president of the Murphy Chair Company, Detroit, and the general manager, John L. Lovett.

Directors—Three years: L. F. Bomhoff, treasurer, Jaxon Steel Products Company, Jackson; W. O. Adams, president and general manager, Production Foundries Company, Ann Arbor; A. M. Larsen, works manager, Manning, Maxwell & Moore, Inc. (Shaw Crane Works, Muskegon); A. R. Demory, president, Timken Detroit Axle Company, Detroit; George P. Wigginton, general manager and president, Kalamazoo Loose Leaf Binder Company, Kalamazoo.



Two years—M. W. Neal, treasurer, the Acme White Lead & Color Works, Detroit; W. C. Rowley, vice-president, Federal Motor Truck Company, Detroit; F. W. Foote, general manager, Imperial Furniture Company, Grand Rapids; W. S. Rowe, president, Valley City Milling Company, Grand Rapids; Arnold Boutell, secretary, Saginaw Manufacturing Company, Saginaw.

One year—David Averill, vice-president, Dort Motor Car Company, Flint; W. H. Burnham, president, Peerless Wire Fence Company, Adrian; W. E. Curry, general manager, Cobbs & Mitchell, Inc., Cadillac; Sydney C. McLouth, Vessels & Shipbuilding, Marine City; P. W. A. Fitzsimmons, president, H. Brewer & Company, Tecumseh.

DICKINSON RETAINS POST

In connection with the taking over by the state of the Michigan State Fair, which will hold its seventy-second annual exhibition in Detroit next September 2 to 11, the services of G. W. Dickinson as secretary-manager have been retained by the board of managers. In the eight years Mr. Dickinson has acted in this capacity the Michigan State Fair has grown from a small, money-losing venture to the greatest fair in America, with splendid grounds and buildings of its own at the northerly limits of Detroit, and a series of premiums and prize awards for exhibitors which are the most attractive anywhere. In addition, the fair's financial success has assured still further growth from its present dimensions.

USES AND LIMITATIONS
of
Car Type and Car-and-Ball Type Furnaces
are clearly defined in Bulletin 222-B.

Irregular heating of high charge in car furnace, showing tendency to overheat at the top and formation of cold zone (X) at bottom due to comparatively cold hearth.

Typical installations are shown to illustrate—

The applicability of car type and car-and-ball type furnaces to the heat-treatment of material that cannot be advantageously handled in other types of furnaces.

Factors governing selection of the type (car or car-and-ball) best suited to individual manufacturing requirements.

Difference in design of each type.

Influence of unequal cooking on the quality of finished product.

In brief, this bulletin is a discussion of principles which will appeal to those interested in furnace design, loading and handling methods, heat generation and utilization, etc.

4-passenger coupe	4,950	5,750	800
5-passenger sedan	5,400	6,000	600
7-passenger suburban limousine	6,000	6,600	600
7-passenger town car	6,000	6,000	600

Effective July 1, the prices of Templar cars, made by the Templar Motors Company, Cleveland, will be reduced from $500 to $600, as follows:

Model	New Prices	Old Prices	Reduction
5-passenger touring	$2,385	$2,885	$500
4-passenger sportette	2,385	2,885	500
2-passenger touring roadster	2,385	2,885	500
5-passenger sedan	3,185	3,785	600
3-passenger coupe	3,185	3,785	600

Durant Motors Factory in Lansing

(*Continued from Page 9*)

be cut through from Michigan avenue to Saginaw street. Tied into the main "stem" of the plant are to be three supply units 90 by 400 feet each. These will take care of all body processes, motor chassis machinery, etc. Another wing, 80 by 260 feet, and one story, is devoted to the enameling processes.

Sidings, feeding from the Manufacturers' Belt Line to the rear of the plant, serve the various supply units. One siding to the south takes care of the finished product. The heating plant is shown in the rear. The administration building faces the proposed new street and is located in front of the main plant.

The factory will be operated by electric power. The entire scheme is, in a word, the condensed whole of Mr. Ver Linden's long experience as production manager. Efficiency, economy, conservation of time, ease of operation all are embodied in the plan.

The buildings will be of reinforced concrete, with brick trimmings and plenty of glass. The office is of the same material. With the exception of the enameling unit the remainder of the plant and the administration building will be two stories. Excavation work is under way, the building to be ready for occupancy in November. Manufacturing starts January 1, 1922. The cost will be nearly $3,000,000.

Detroit Tigers' Home Dates for 1921

June 21, 22, 23	St. Louis
July 8, 9, 10, 11	Boston

A Life Saving Proposition

THE DETROIT ELEVATED RAILWAY SYSTEM established in Detroit would save more lives than all other agencies combined.

THE DETROIT ELEVATED cars, being 15 feet above the surface of the street, could not collide with street traffic.

This is of vital importance to every citizen of Detroit.

The carrying structure is supported on single, steel standards, thirty inches square, placed about fifty feet apart on heavy concrete foundations. Compare this with sixteen feet required by a double track surface line. This system does not hinder surface traffic to any appreciable extent.

Every Dye Plant An Arsenal

(*Continued from Page 10*)

Dr. Julius Stieglitz, director of the department of chemistry, University of Chicago, said in a recent address that many lives and much suffering could have been saved during the war had the United States and the other Allies had well developed dye industries. He counted, he said, twenty-nine important substances from coal tar in the letter A columns of a list of drugs. Mr. Choate mentioned in his Detroit address that during the war, when antiseptics and drugs were scarce, dyes were used in dressing wounds, with the result that many of the wounded soldiers "looked like Easter eggs."

Although this whole subject has been treated superficially in these articles, it must come home to Michigan manufacturers as one which is of the utmost importance. We have in Michigan Parke, Davis & Company, the Dow Chemical Company and the Charcoal Iron Company of America making chemicals, so that the state is not entirely immune from such evil results as might develope from failure to support such legislation as will protect the dye industry from selfish interests and the German ambition to cripple every other nation industrially as well as in armaments.

In the absence of Mr. Dow, G. Lee Camp, sales manager of the Dow Chemical Company, Midland, writes this paper as follows on the general subject of competition in chemical manufacture:

"We presume the problems presented by the abnormal exchange situation are not generally understood except by those manufacturers who are forced to meet the German competition.

"The ratio of exchange between the mark and the dollar, as compared with 1914, has so changed that a mark has depreciated sixteen fold, whereas the cost of labor in Germany has increased only 800 per cent. As compared with this, we have the corresponding increase in cost of production here in America, as compared with pre-war days. Unless some action is taken to offset this great difference in costs, the future position of the American chemical industry is indeed precarious. Assuming that the mark has depreciated in value double the extent that German labor cost has increased. German labor cost has increased only 50 per cent. Labor is the basis of cost for most all raw materials, and in addition there is the advantage of idle boats which will eventually mean much lower ocean freight rates.

"While it is the hope of every one of us that the United States may never again be compelled to engage in war with another country, this hope does not justify us in total disarmament. When it is shown that we may provide ourselves with numberless battleships, supplies of artillery, etc., but that without the necessary chemicals these implements under modern conditions would be practically useless, it brings it home to every one of us that the chemical industry must be maintained by adequate governmental protection.

"The tendency of exchange conditions is to throw the world's chemical business toward Germany, which will result in greatly strengthening her manufacturing facilities and placing her in a more complete position again to dominate the world in chemical manufacture. The temporary protection provided for in the Knox amendment is of assistance but this covers only coal tar products.

"While Germany thus far has not been able to attack the American heavy chemical trade seriously, should her position remain long as at present there is no doubt that she can do so, barring artificial means to prevent her, and this country will be placed in a dangerous position unless we are able to supply the crudes, or heavy chemicals, required as the raw materials for dyestuffs manufacture.

"It is not safe to return to the position of exporting raw materials and importing manufactured products, which was largely the basis of our foreign trade prior to the war."

NEW RIVER RAISIN CO UNIT

One section of the new unit of the River Raisin Paper Company's plant at Monroe, was opened a few days ago for production and the capacity of the factory was increased by 60 tons daily output of 92-inch corrugated straw board.

The new section is 720 feet long and 60 to 80 feet wide. It is composed of steel, brick and concrete. The machine just put into production is a Black & Clawson drying machine. The plant will be further equipped with eight iron rotaries made by Biggs Boiler Works, Akron, and six 1,500-pound heaters from the Valley Iron Works, Appleton, Wis.

The company's plant, when completed, will rank with the first in the United States in size. It will have a daily capacity of approximately 700,000 pounds of stock. When operating at capacity it will employ about 1,450 persons. Its railroad yards can store 350 cars at one time.

ESTABLISHED NINETEEN HUNDRED SEVEN

IN MICHIGAN—
and Elsewhere

Michigan has always been the territory in which the DIME SAVINGS BANK specializes in service to banks and bankers—and to business houses.

But the bank also has connections in many other sections throughout the country, these enabling it to handle with dispatch any banking transactions which banks at a distance may have in Michigan, while also adding to the value of its service to its correspondents and depositors in the Michigan District.

Personal attention of the bank's officers is given to inquiries from banks that may wish information regarding this great field which is essentially Detroit territory, or regarding our specialized Michigan banking facilities.

When in Detroit, make the DIME SAVINGS BANK your headquarters.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

A Word From the Editor About This Issue

THE FEATURE of this issue of the Michigan Manufacturer and Financial Record is neither novel nor unusual. From being the current source of supply of news respecting the financial developments of Michigan, the chronicle of those events in finance which combine to make cycles and whose continuous record is history, the paper becomes a bit more intense in this issue in the way of increasing the breadth of its weekly picture of the doings of them who have money in Michigan and employ it and them who have not, and of the consideration of the investment field in which the croppings of commerce and industry are sown and from which their fruitage must be reaped. In this issue we are simply making a survey of the field of investment from the point of view of the period of reconstruction and reorganization of the demand for investment money which is arising from several causes and from several sources, and endeavoring to set it out all together to our readers. Much pains has been taken to put this information into permanent shape, in the hope of two eventualities. The first of these is that this effort may not be considered of ephemeral value, but that the conclusions arrived at and set forth may be held to be of sufficient value to be preserved for reference. The second is that, from time to time in the future, perhaps annually and perhaps oftener, such a resume of conditions may be made again at some of the mile-posts of investment and business development.

The conditions which confront the owners of money in Michigan and those whose business it is to retail investments to owners of money are absolutely unique. Never before has there been such a demand for fresh capital, or for the reorganization of capital already invested. Since the beginning of the world war the price which has to be paid for the use of money has constantly advanced. Great fortunes of the ante-bellum period, invested in the low return securities which were then the vogue, have ceased to be the producers of the incomes, measured by their purchasing power, to which their owners once looked forward. Most of us who have been familiar with the doings of the marts of money for any period can readily remember the demand for long-time investments, which would relieve their purchasers of the annoyance, often more feigned than real, of reinvesting their capital. The insurance companies, the rich estates, the educational and charity foundations were all ready to put their capital into investments at comparatively low rates provided they were of long enough period. The rate of standard interest had been going downward steadily in Europe since the Napoleonic wars, and in the United States since the Civil war, and what the investors feared was not the inconveniences of reinvestment but the very great convenience of tying up the debtor class for a long time to a rate of interest which, while it might be low at the moment of investment, might be lower still thereafter if a contract for its continuance did not prevail.

Great sums of money are today invested in various forms of American securities at these low rates. There are millions of municipal securities on which but 3 per cent is paid, while very fine opportunities exist today to purchase the same class of securities, and of equal or better credit, realizing 6 per cent. There are millions of railroad bond issues now drawing but 4 per cent, some of them but 3½ per cent, while the unissued and unsold remnants of these issues will not be looked at for less than a 6 or 7 per cent basis today, reducing their returns to the issuing corporation to an impossible sum in new capital, or calling for riders to their secured coupons in the way of interest coupons which are really notes of the corporations and do not come within the security of the trust deeds or mortgages. There are millions of real estate mortgages, and of bonds secured by them where they have been subdivided, which cannot be sold except at a discount which will equalize the low interest rates upon the basis on which they were contracted with the much more advanced rate of interest returns which prevail today.

Similarly in industrial enterprises forms of participation in interest which were formerly attractive have ceased to possess their attractiveness. Bonds on the properties, preferred stock liens on their earnings and distribution of assets have all been tried, had their day and come to be unattractive, for the time at least. The reasons for this unattractiveness are many and varied. The primary one is the return on the investment. Another is that much surplus industrial capacity was provided for the war period that has since proved unnecessary, at least for the present demands of trade, and, as a consequence, the securities issued to provide them must be maintained from the operations of the earlier and lesser capacities.

Briefly, there has come from these various causes a turn in the investment road which has already called for reorganizations of financial structures, readjustments between the conditions under which capital was invested at earlier dates and those under which it can be obtained today, and other operations, not unusual nor unprecedented, but marked by increased greatness of number compared with their number in the past. The Wabash railroad reorganization of a quarter of a century ago, as conducted by Mr. Solon Humphreys and, as we remember, Mr. Thomas Tutt, was an intricate financial event, the novelty of which and the details of which were really so interesting as to attract the attention of the public who were not investors at all. Yet brilliant as that scheme was, and fairly successful withal, it has been discounted a dozen times in the last year or two by the refinancing of great automotive industries involving today as much capital as the great railroad system did then. The first example was, after all, the scaling down of income to meet the necessities of income production, the investors being the meek, shorn lambs who had to take the medicine the reorganization doctors prescribed for them. In the reorganizations of this period the process is duplex. There is a scaling down and retirement as to priority of security and return of the "ins," and a scaling up of conditions for the new capital which has to be attracted to set these organizations on their feet again.

The same condition is measurably true of steam railroads, of public utilities and of other classes of investments. So that we have come to a new viewing point of securities and investments therein, based upon the assumption that for a considerable period of time in the future interest rates are going to be higher than they were during the period from 1884 to 1893, and much higher than those of the period from 1896 to 1914. The demands for new capital have also become more varied and more urgent. Luckily the supply of new capital is always coming on in these United States, and proportionately, very fast in this state of Michigan. The evidences of this condition are both statistical and practical.

Prof. David Friday, of our state university, sets the annual contribution of new capital from the national earnings at about 7,000,000,000 dollars. We add more than our average share of that from Michigan. Yet we hear of tight money and of unavailability of funds for certain operations. In the face of this let some brazen promoter or stock seller put out some attractive blue sky proposition, or some extraordinarily tempting gamble, and lo, and behold you, the money comes out like peas from a pod; from where the Lord only knows, but it comes. It may not be as respectable money as that of the elect of the investors, but there it is, with the dollar mark on it,

Digitized by Google

and a capability of buying 100 cents worth for every dollar, just like anybody else's money.

In the hope that in these reorganizations of capital already assembled and in the demand for new capital, and in the orderly assemblage of this "wild-cat" capital that seems to be available when risk and compensation are apparently decently balanced, some help may be given to the regular and the casual investor and to the organization of security dealers who act as marketmen between the demand for money and its supply, this publication is made. It is neither a primer of investment nor an encyclopedia of finance. It is, what this paper always seeks to put out, a good honest effort at presenting useful information which may be of some good to people endowed with that ordinary amount of brains which enables them to accumulate and conserve modest holdings of capital, and who care enough about the return upon it to want to get the most money for its use, without courting the possibilities of its extinction, so far as their personal ownership of it is concerned.

What the Investment Bankers Are Doing for Michigan Business

They Are Taking Surplus Capital, Wherever Found, And Distributing It to Enterprise, Wherever Needed

By PHIL S. HANNA

Financial Editor, Michigan Manufacturer and Financial Record

THERE is a species of banker at large in Michigan who does not make the cold chills creep up and down one's back when he is approached, but who on the other hand is likely to warm up agreeably if you get within smiling range. His natural habitat is in places where persons congregate who have money for investment and he is usually in a state of constant hunger, meaning thereby that he is usually hungry to make you buy his wares. But it should not be construed for a moment that because a bond salesman importunes you to buy his offering the security is any the less desirable than it might be if you were obliged to seek the salesman.

Unthinking people sometimes advance the theory that if all investments were as good as salesmen make them out to be there would be no need of salesman or of advertising. Let us dwell on this for a moment. On such a theory every time anyone came into possession of surplus wealth he would be oblized to go on a shopping tour to find the investment suited to his particular case and in order that a dealer might prepare himself to care for both large and small customers he would be obliged to carry in stock an enormous bulk of securities of all kinds and denominations. He would have to employ a sum of money in carrying his stock of assorted investments larger than that represented by a fair sized city bank and his margin of profit would necessarily have to be widened to permit of absorbing the large carrying charges. Thus to begin with there is this essential, that if investments are to be handled on a moderate margin of profit the dealer dispose of his new stocks of merchandise with the greatest possible speed. So the bond dealer sends his salesmen and his circulars to all his clients, real and prospective, whenever he has a new issue of bonds to offer and in this manner he conducts his business with the minimum expense of carrying stock on hand, and at the same time the investor gets the same choice of goods which might be possible if bonds were carried in stock the same as clothes or hardware.

But the big distinguishing difference between bonds and other merchandise is the lack of uniformity in quality of goods handled. One load of coal may vary from another, shoes may vary in quality according to the makers but in all merchandising the buyer sees the goods, whereas in selling investments the buyer seldom "sees" the goods purchased. He must rely on the statements of the bond merchant as to the facts surrounding any particular security. And right here is where thousands of investors fail to appreciate the protection which they get from the far-reaching and painstaking examinations made by high grade underwriting syndicates before any issue of bonds is offered to the public. It were much better for the investor to begin reading bond circulars from the bottom of the page, first noting the name of the offerer, for there are hundreds of houses whose name alone, attached to an offering of bonds, is accepted in the same manner and means among investors as the mark "Sterling" is taken by purchasers of silverware. Thus to begin with there is one outstanding service that the investment bankers are rendering to the people of Michigan, namely: furnishing a supply of carefully selected investments for the thrifty and the wealthy.

The query often comes to mind in connection with the investment banking business, whether the average investor realizes what it would cost him individually to make the preliminary examinations coincident with the underwriting of a bond issue. Does he realize how much expert legal and engineering and accounting talent is usually employed in sizing up a proposed offering? Does he realize the expense to which he might be put in collecting the interest and the principal and that oftentimes he might be obliged to step in and take part in the management of a borrower's business to protect his investment? Possibly the big investor appreciates the value of the underwriter's service in this connection and possibly he also appreciates that this service is rendered without extra charge. But it is the "little fellow" who needs the missionary and it is he who usually expects the largest returns on his investment. And it is he also who gives the fly-by-night investment banker the same railing as one who has spent a small fortune putting his name and his business up beyond the reach of scandal mongers. Yet when the reputable investment dealer approaches the small investor he is immediately put on the defensive; good name, reputation, standing are all overlooked and the test of the reception accorded him is mainly the plausibility of his proposition and the size of the returns offered.

There is no dependable way even to approximate the amount of money which the people of Michigan have sunk in blue sky schemes but here and there one finds striking instances of how this waste of money has been measured. In a small upstate town which has only one bank the cashier kept account of checks which his customers gave blue sky promoters and also took special notice of the notes which were offered him by promoters, and he figured out that the amount of actual cash which went out of his town for questionable investments was approximately equal to the amount which his bank had to borrow from the Federal Reserve. Now no one will question any person's right to do what he wishes with his own money but in this instance the investors not only crippled themselves but also curtailed the available credit of the bank to such an extent that the ordinary business of the town has been held back seriously. Had this money been invested in sound securities there would be in this little town a base upon which credit upwards of $50,000 could be secured.

In the early days of the development of the automotive industry bankers in the West used to worry about Detroit. They used to say that people were buying automobiles so fast that Detroit was apt to draw money from banks all over the country. The writer recalls vividly a bankers' convention where the principal speaker expressed great fear of such a calamity. But this man did not realize the function of the investment banker. He did not know that perhaps as he spoke persons in Detroit, through the medium of the investment bankers, were using the same funds, drawn from his section by a Detroit automobile plant, for the purchase of bonds of his city. There can be no doubt that more money has gone out of Michigan than into it due to the attractive tax-exempt bonds of other municipalities, and while this article is not intended to deal with the tax exemption subject, the incident illustrates fittingly the function performed by the investment banker in the banking machinery, namely: he makes the surplus wealth of one community available for the development of industry in another community, or the surplus of one line of business

Digitized by Google

available for other lines in the same place. He is sort of a master distributor, considered collectively, taking the surplus wealth of the automobile industry, for instance, and distributing it in small lots to other lines of business both within and without the source of production of that wealth. This process is accomplished when a Portland, Ore., light and power company bond is sold to a Detroit investor.

Nor is the current of funds always away from Detroit. It is stated that the recent issue of Packard notes was much more heavily purchased in the East than at home and in this instance, therefore, the investment banker performed the same function. The same with the municipal railway bonds. In fact the opinion of well informed observers, i.e., that tax exempt bonds have robbed Michigan of much of its own natural capital, seem to be more obvious every time it becomes necessary to go away from home for money. But this of course is not the fault of the investment banker. His business is to take surplus capital wherever found and distribute it wherever needed, although as a citizen and Christian he is going to stand behind legislation that will give us equal advantages as to retaining home money for home investment; and he will likewise be just as satisfied to sell home investments to home investors as he has been to sell foreign investments to home investors. When the Michigan Manufacturer and Financial Record started the agitation against tax exempt bonds early this year there arose a storm of protest from many investment bankers who could see in the changes sought only injury to the municipal bond business, and it is therefore significant to quote the remarks of one of our best known bond men, who said recently:

"I was very much opposed to this matter when your paper first proposed to reinstate taxes on municipal bonds, but in the light of experience since that time I am now thoroughly convinced that there should be a tax. By keeping money at home we will be developing our own community and making future bond buyers, whereas by permitting so much of our surplus to go away from here we are encouraging development of other cities and making thereby bond buyers for someone else."

It has been thought that perhaps a few concrete instances of what the investment bankers have been doing for Michigan might be of interest, in that it will tend to show to what a large extent business depends on this species of banker for its capital and its long time loans:

Below is a partial list of issues sold by Detroit bond houses recently. It should be borne in mind that where syndicates have handled a large issue there may be some over lapping of the figures and further that the list is only partial, many of the houses not being represented. Nevertheless these few figures show to what a large extent the business interests of the country depend on the investment bankers.

Watling, Lerchen & Company during the last three years have underwritten directly and indirectly $6,855,000 of securities of local corporations among which are the following:

$ 250,000 Jas. Vernor Company, First Mortgage 6½% Bonds.
$ 175,000 Lartowe Realty Company, First Mortgage 6½% Bonds.
$ 125,000 Tristate Baking Company, First Mortgage 7% Bonds.
$1,250,000 Eddy Paper Company, First Mortgage 7½% Bonds.
$1,400,000 Chemical Iron Company of America, 7% Notes.
$ 375,000 Jefferson Force Products Company, First Mortgage 6% Bonds.
$ 400,000 Fort Shelby Hotel Company, First Mortgage 6% Bonds.
$ 200,000 Arctic Ice Cream Company, 8% Preferred Stock.
$ 100,000 W. A. C. Miller Company, 8% Preferred Stock.
$ 200,000 Joseph N. Smith & Company, 8% Preferred Stock.

In addition to the volume of corporate securities handled, this house has distributed a large number of outside corporation and municipal securities and bonds of about 100 Michigan municipalities, the aggregate thereof being approximately $11,000,000 during the last three years.

The main business of Keane, Higbie & Company is handling municipal bonds, but the house does in the neighborhood of $1,000,000 annually of corporation financing. Another prominent house which does not wish to be quoted has sold the following:

$1,500,000 Detroit Pressed Steel Company, 7% Preferred Stock
$ 600,000 Hayes Iotin Company, Serial 6% Notes.

Merrill, Lynch & Company, since June 1919, have handled the following industrial issues:

$1,150,000 Crown Oil & Refining Company, First Mortgage Serial Convertible 7% Gold Bonds.
$3,000,000 Spicer Manufacturing Corporation, 6% Serial Gold Notes.
$3,000,000 Spicer Manufacturing Corporation, 8% Cumulative Pfd
60,000 shares Spicer Manufacturing Corporation, Common stock.
$3,000,000 S. S. Kresge Company, 7% Serial Gold Notes, due serially 1922 to 1926.
$3,000,000 Liquid Carbonic Company, 8% ten-year Sinking Fund Gold Notes. Dated October 1, 1920. Due Oct. 1, 1930.
$ 141,888 Simms Oil Company, 6% Equipment Trust Notes.
$ 215,000 Maryland Refining Company, 6% Equipment Trust Notes.
$ 374,000 White Oil Corporation, 6% Equipment Trust Notes.
$4,000,000 Marland Oil Corporation, ten-year 8% Sinking Fund Participating Gold Bonds. Dated April 1, 1921. Due April 1, 1931.
$ 700,000 Sinclair Refining Company, 6% Equipment Trust Notes.
$ 600,000 Neptune Meter Company, 7% Serial Gold Notes.
$1,150,000 Crown Oil & Refining Company, First Mortgage Serial Convertible 7% Gold Bonds.
$1,500,000 General Phonograph Corporation, First Mortgage 7% Serial Gold Notes.
$1,000,000 Panhandle Producing & Refining Company, 8% Cumulative Preferred stock.
$1,500,000 Patrhouse-Plymouth Mills Corporation, 8% Cumulative Preferred stock.
320,000 shares White Eagle Oil & Refining Company, Capital stock (No Par Value).

Harris, Small & Lawson have sold the following local industrial issues:

$ 500,000 Windmill Point Land Co., First Mortgage 6% Gold Bonds.
$200,000 Square D Company, First Mortgage 7% Gold Bonds.
$1,500,000 of Michigan Municipal Bonds in addition to many other Municipal issues. This is another house which confines itself more to Municipal than Industrial Bonds.

Industrial securities handled by Hornblower & Weeks recently are as follows:

$3,250,000 Chicago Pneumatic Tool, Serial 8s.
$1,800,000 American Bosch Magneto, Serial 7s
$3,000,000 Connecticut Valley Lumber, Serial 6s.
$7,500,000 Brown Co., Debentures.
$2,500,000 American Chicle Co., Serial 6s.
60,000 shares American Bosch Magneto stock.
95,000 shares Atlas Tack Corporation.

The firm also has raised capital in varying amounts for the following: Chandler Motor Car Company, Chevrolet Motor Company, Edmunds & Jones Corporation, Endicott-Johnson Corporation, Federal Furnace Company, Harmony Mills, Lee Rubber & Tire Corporation, McCrory Stores Corporation, Mullins Body Corporation, Ohio Body & Blower Company, Thos. G. Plant Company, Parish & Bingham Corporation, Punta Alegre Sugar Company, Trinidad Sugar Company, Gardner Motor Car Company of St. Louis, and many others. In addition to the above this house reports many millions of dollars of municipal bonds sold.

Fenton, Davis & Boyle have raised capital for the following Michigan corporations and cities as follows, in addition to a large amount of outside financing:

Name.	Participation.
Baker Lane Company, First Mortgage 7s, due 1928	$175,000
Eddy Paper Company, First Mortgage 7½s, due 1931	200,000
Packard Motor Car Company, 8s, due in 1931	10,000
American Light & Traction Co., 6s, due in 1925	35,000
Continental Motors Corporation, 7s, due 1923-1925	75,000
Detroit Edison Company, 5s, due 1940	50,000
Detroit Edison Company, 6s, due 1940	100,000
Detroit Edison Company, 8s, due 1940	150,000
United Fuel & Supply Company, 6s, Serially	100,000

The following are a few municipal issues they have sold:

St. Clair County 6ss	$100,000
Macomb County, 6s	50,000
State of Michigan, 5s	100,000
Rochester, Michigan, Sewer & Water 5s	75,000
Fremont, Michigan, City Hall 5s	50,000

In addition to a large amount of financing in New York and Chicago and other large cities, S. W. Straus & Company have raised capital for local building projects in large volume, of which the following is a partial list:

1700 Jefferson Avenue, First Mortgage 6s	$2,450,000
McCord Mfg. Co., First Mortgage 6s	1,500,000
Lincoln Square, First Mortgage 6s	400,000
Hotels Statler, Detroit, Cleveland, Buffalo, St. Louis and New York, First Mortgage 6s	2,000,000
Canton Building, First Mortgage 6s	400,000
Warwick, Brainard, Petticord, Buhols, Jefferson Hall, Bigelow, Pickert, Gordon, Prince Rupert, Collingwood, Milford, Dunedin Court, Rex Arms, Apartment Buildings, which aggregate	1,500,000

Oils & Company report the following new issues underwritten in the last three years:

Issue.	Amount
American Strawboard Company	$ 1,500,000
H. F. Goodrich Company	7,000,000
Fisher Body Company, Preferred	10,000,000
Fisher Body Company, Common	2,000,000
Bulkley Building Company, Preferred	3,000,000
Bulkley Building Company, Common	1,400,000
Jefferson Sargent Company	1,000,000
Wm. Davies Company	5,000,000

issues it has underwritten during the last three years as $3,017,700, among which are the following:

Adolph Meyers, Detroit	$ 50,000.00
The Berub-Robinson Company, Detroit	150,000.00
Walter P. Haase, Detroit	130,000.00
Clayton & Lambert Manufacturing Company, Detroit	550,000.00
The Burkhardt Building Company, Detroit	48,000.00
Oakman Boulevard Theatre, Detroit	75,000.00
Kunstler Hotel Building, Detroit	125,000.00

E. E. MacCrone & Company—Capital raised for local enterprises as follows:

$1,000,000	General Aluminum & Brass Mfg. Company, 8% Preferred Stock
$500,000	Detroit Gear & Machine Company, 8% Preferred Stock
*$500,000	Penberthy Injector Company, 8% Preferred Stock

*Underwritten jointly with Keane, Higbie & Company.

Another company which does not wish to be quoted has sold the following large issues of municipal bonds, the proceeds of which have contributed indirectly to the growth of business through municipal expenditures:

$ 375,000	Benton Harbor School bonds
250,000	Battle Creek School bonds
2,000,000	Detroit bonds (for various purposes)
500,000	Genesee County Road bonds
500,000	Jackson County Road bonds
800,000	Jackson City Improvement bonds
294,000	Jackson School bonds
500,000	Kalamazoo School bonds
200,000	Kalamazoo Improvements
500,000	Pontiac, Schools
400,000	Pontiac, Improvement
200,000	Redford, Schools
175,000	Three Rivers, Schools
950,000	Saginaw, Schools
315,000	Wyandotte, Schools

The Guaranty Trust Company of Detroit has raised $2,596,000 since May 15, 1918, in the form of 375 mortgage loans.

Where Have the Liberty Bonds Gone?

Some Facts to Show That We Should Be Thankful That the Price Slump Has Not Been Even Greater

AFTER an accident or a loss of any kind there is always more or less consolation in looking at the trouble from the standpoint of "how much worse it might have been." When the United States government started issuing "war" bonds the people of the country little dreamed that market values would ever slump off 10 to 20 per cent. For years government issues bearing 2 and 3 per cent had sold above par and at times there was so little supply on the open market that none could be had at any reasonable price. This was especially true when national banks began to bid against one another to obtain eligible bonds to secure circulation.

The thought which comes to mind in discussing this subject is that rather than feel bad because the market values have slumped, we have reasons for jubilation that the slumps have not been greater. The basis for this statement is the fact that from the moment the bonds were delivered there have been many holders who either from force of necessity or otherwise have offered their bonds on the market.

Bankers who worked in the Liberty Loan campaigns recall vividly the many instances where purchasers had to borrow nearly the entire purchase price. And even now they can point to instances where loans made originally to buy bonds have never been paid. Federal Reserve reports for 820 member banks in principal cities show the following record:

Loans on Liberty Bonds—

September, 1918	$ 500,000,000
March 3, 1919	1,000,000,000
July, 1919	1,400,000,000
February, 1921	600,000,000

Financing a war is unlike any other kind of business. The government collects about half of the cost in taxes and borrows the other half, and usually about 90 per cent of the total money collected is just as much wasted and destroyed as if the government collected the money in currency and immediately built a bonfire with it. This is a pretty general statement but nevertheless the picture carries the distinguishing difference between borrowing money and levying taxes to spend for improvements (or even to spend on foolishness) and spending money for bombs, bullets, gas and a thousand and one other articles that are shot up into the air.

War, to use a billiard term, puts the reverse English on economics.

Digressing a little, first, however, it is interesting to look back at the course of market prices of government bonds during and after the Civil War. In January, 1860, all issues hovered around par except the 6s of 1868, which were selling around 106. By November the 5s of '65 and the 5s of '74 had dropped to 93 and 95. During 1861 several issues got down 20 and 25 per cent from par, but by March, 1862, they all came back strong, and by August, 1863, only two issues were below par. By January, 1864, all the issues except the one-year certificates were above par. In 1865 the premiums ran from $6 to $25 per hundred above par. Of course there is little similarity in the banking conditions now and then. We had no greenbacks in 1917, 1918 and 1919. Possibly on a greenback basis the Liberty issues would have sold way above par in terms of greenbacks. But even after specie payments were resumed, several years after the Civil War, the market for government bonds remained above par for all issues until the 2 per cent bonds came on the market in June, 1893, when they sold between 97 and 99 for a considerable period of years, reaching 101 in July, 1899. In March, 1902, the consolidated 2s of 1930 got up to 109¾ and in July, 1913, the 2s got down to 95½.

One of the main reasons advanced, and a very common one, which is present in any transaction, why the Liberties have fallen below par is that there were more sellers and buyers. An examination of the table following will show at a glance how large the supply of bonds was during 1917, 1918, 1919, 1920, compared with the pre-war period.

Total United States Debt 1909 to 1920.

Years.	Amount.
1909	$ 1,023,861,531
1910	1,046,449,185
1911	1,031,850,808
1912	1,027,574,697
1913	1,028,558,103.
1914	1,027,257,009
1915	1,089,848,006
1916	1,047,294,579
1917	1,908,635,225
1918	10,924,281,354
1919	$24,479,302,376

Liberty issues outstanding June 30, 1920.

Issue.	Amount.
1st 3½s due 1947	$ 1,410,074,400
1st 4s due 1947 Conv	45,803,950
2nd 4s due 1942	240,003,250
1st 4¼s due 1947 Conv	473,089,200
2nd 4¼s due 1947 Conv	*3,492,150
2nd 4¼s due 1942 Conv	3,085,363,750
3rd 4½s due 1928	3,662,715,800
4th 4¼s due 1928	6,394,354,500
Vic. 3¾-4¾ due 1923—3¾	818,385,650
4¾	3,427,969,700
	$19,581,201,450

*Outstanding Nov. 1, '20.

In round figures, the total government indebtedness between 1913 and 1920 jumped from $1,000,000,000 to $25,000,000,000. In fact the suddenness of the rise in quantity was the most abrupt change in the history of the nation. In 1794 the total debt was $78,407,404, which was whittled down to $45,209,000 in 1812, but rose suddenly to a high point of $127,334,000 in 1816, a rise of three times in four years. (Contrast this with a jump from $1,908,635,225 in 1917 to $10,924,-281,354 in 1918.) From 1816 the course of the debt was downward steadily, until in 1835 it was reduced to the remarkably small sum of $37,513. Between this date and the Civil War the total debt ranged up as high as $68,000,000 (in 1851), but in 1861 it was only $87,614,650. As a matter of information we give the total debt by years from 1860 to 1909; from 1909 to 1919 the figures are given above:

1860	$ 59,864,402	1874	2,104,159,153
1861	87,614,660	1875	2,090,041,000
1862	505,312,762	1876	2,060,925,420
1863	1,111,356,727	1877	2,019,275,421
1864	1,709,452,277	1878	1,999,282,280
1865	2,674,815,856	1879	1,996,414,905
1866	2,636,036,163	1880	1,919,326,747
1867	2,508,151,211	1881	1,819,650,154
1868	2,480,853,413	1882	1,675,023,474
1869	2,452,771,873	1883	1,538,781,825
1870	2,331,169,956	1884	1,438,542,995
1871	2,246,994,068	1885	1,375,352,443
1872	2,149,780,530	1886	1,282,145,840
1873	2,105,462,960	1887	1,175,168,765

The Demand for Public Funds

Public Utilities, Municipalities, Corporations, Building Industry and Railroads in the Market

By THE EDITOR

With the readjustment that has come upon the country since the close of the war a demand for new capital has arisen quite out of proportion to any that has been heretofore observed. That demand is due to a great many causes. Simmered down, they may be summarized as having been the application of almost the entire labor supply of the country to war work and similar application of the money supply. By reason of various legislative and administrative acts progress along ordinary lines of endeavor was practically prohibited from 1917 until well into 1919. As a result the following things happened:

First: Municipalities were held up, both because of the supply of labor and the supply of money, from undertaking the usual and ordinary public works which form a great part of the construction operations of the country and which are the precedent to growth of the cities and villages. Important extensions of city services, such as of water and sewerage systems, the construction of school buildings and of public structures of various kinds, were not made, with the result that now that the country has gotten its breath, there is the accumulated demand of several years to supply in the matter of structures of this class. This demand has been allowed to go unsatisfied for so long a period as this after the war, for two leading reasons, the one the general prediction that the raw materials for building operations would decline in price; the other that the wages of labor would come down in terms of money paid, or that its efficiency would go up, which would accomplish the same result. There is no denying that the efficiency of labor employed on construction work during the war was woefully bad, which was probably only human nature after all. For example, bricklayers who used to set 1,200 bricks for a day's work when wages were $6 a day, fell in efficiency to 500 bricks a day when $10 and $12 became the compensation for eight hours' work. Last year in Detroit the architects and superintendents noted that the bricklayers were doing better, getting up to 800 bricks as the result of a day's work, while this year 1,000 bricks are being laid, while the wage has gone down to $8 a day. It makes a good deal of difference in the cost of large construction jobs whether it costs two cents or four-fifths of a cent to lay each and every brick, and this difference is to none so apparent as to the wise city dads who have to make the taxpayers' money go as far as they can. Conditions quoted as of Detroit were and are typical countrywide. Materials have fallen measurably in price as well, so that between the public demand for extension of facilities and this decision that prices have come down to a reasonable level, an immense amount of public work has been started. Most of this work is paid for with the proceeds of city bonds. Many of these bond issues had been authorized long before the necessity for their proceeds was finally established and they all seemed to come upon the market at once, thereby creating a very great demand. Under the influence of this demand last winter and during the spring of this year a new and higher level of interest rates on municipal securities was established, until 6 per cent is the ruling figure today, disposals from original buyers to private investors being on a slightly lower basis of interest return, this margin covering the wholesale buyer's profit. At any rate, there is an immense amount of municipal securities seeking a market today. The higher interest rates now prevailing have, of course, depreciated the sale prices of the older and lower rated securities, the holders of many of which are throwing them on the market to get the benefit of the use of their money for engagement in the new issues which are productive of higher returns. That constitutes one great demand for the money of the investing public.

The Situation of the Railroads

Second. The war played hob with the railroads. These utilities were pretty badly handled long before the war, between the legislatures, the commissions and Congress. The tendency to reduce their revenues, increase their operating costs by imposing new safety conditions, and give labor the opportunity to raise its costs while there was no balancing addition to earnings had put the American railroad system into bad shape. This was especially true of railroads whose operators had neglected to conserve the physical condition of the properties. When they needed money they had no earnings to carry the burden of the added capital, not even any surplus to attract the new capital. The guarantees of the Government carried them through the war period, but the stresses which were put upon them left a good many American railroads in 1918 where they needed a lot of new money for rehabilitation. Then came the delays in government settlements. These have only recently been concluded. The result is that the railroads, having finally been conceded rates which will be profitable, and being promised an adequate reduction of wages by the Railroad Labor Board, are seeing their way to the use of money for the renewal and amendment of their properties. But this demaud is also all coming at once, so that demand impinging on supply has had the result of raising interest rates for this class of securities. Inasmuch as those who invest in railroad securities are a class by themselves to a large extent, there appears to be a pressure upon the companies on the part of those who hold low-rated securities to bring about adjustments of existing debts before they "loosen up" with new money. A marked example of this demand and of accession to it is to be noted in the recent refinancing operation of the Burlington road, in which $230,000,000 of bonds were issued, providing higher interest returns for the old capital invested in the mortgage securities as well as for the new money. So many railroad issues are closed that available means for improvements are impossible without taking account of present holders of low-rated issues before the security can be divided between them and the new supplies of money. This means that the railroads will have to pay more for their money than they used to do, at least for the immediate present.

The Utilities Come Into Their Own

Third: The public utilities have lately come into their own. By these we mean the utilities which have electric energy as their basic operating power, and to which gas-making and distributing plants are usually subsidiaries. To begin with, the electrical utilities never did get a fair start. In their inception the promoters had none but theoretical figures of their operating costs. People who are not old enough to have been familiar with the figures which were presented at their inception need only study the kind of operating figures that are nowadays being presented by proponents of municipal enterprises of the kind to get an idea of the looseness of the figures upon which installations were originally made. These early-day promoters and engineers seem to have been impressed with the idea that they must show wonderful economies in cost of service compared with the cost of the services which they were supplanting. It never seems to have entered their minds that the public was amply able and willing to pay for a better service than it was getting. Then they had no experience with operating costs and conditions. So it came about that installations were made which rapidly became obsolete from lack of capacity and reserve. As the art was developed still another process of obsoletion was experienced by the fact that the newly-devised apparatus presented such advantages that it was unthinkable that it should not be immediately installed. This was particularly the case at the time of the development of long distance transmission of alternating current. That bit of progress in the art made it possible to operate long lines of railway from a single power station with a light investment in copper, where theretofore direct current was transmissible only from eight to ten miles on either side of the station, with a relatively very heavy investment in copper. The writer has in mind a very costly direct current station that was contracted for on a Michigan interurban which was actually obsolete before it was installed. The bonds which paid for it twenty years ago are still bearing interest, despite the fact that it was replaced a year after it was put into operation.

This and other causes of the same type led to some early overloading of the utilities with bond issues. Unfortunately, none of the early operators of these public utilities had any concept of the sums of money which would be required for the development of these properties. It is true that bond issues of considerable size for that

Selecting Your Investments

Wise investment in securities requires comprehensive view of the entire bond market and familiarity with its practices.

This is the service we provide. Our company was organized in 1915 by men of long experience in marketing bonds. Since that time we have specialized in the distribution to investors of conservative issues, basing our operations always on this prime consideration—Safety of Principal.

Conditions are favorable for investment today, when your money procures a greater income than at any time in the past decade. In many classes of high grade bonds, one thousand dollars will yield 50% more now than before the war.

Profit may be made, too, in many instances, by exchanging securities you now own for some of the many excellent present offerings.

Our list includes Bonds and Preferred Stocks purchased by us only after careful analysis that enables us to recommend them for safe investment.

Now is the time to buy. We offer you intelligent, frank, conscientious service in the selection of your securities.

period were authorized as to many of them in the past, but the possibilities of these for producing capital funds have very generally been exhausted. The companies have had to have recourse to various other artifices for the production of funds from credit. Collateral trust issues, short and long-term notes, preferred stock issues and the like have constituted the artifices by which temporary financing has been accomplished. Now that these concerns are facing the future, there has been and will be some very large programs of finance or reorganization, which in turn will call for fresh money, largely from the same investment field which is already interested in the low-rated earlier securities.

It has already become patent to the operators of these companies that they will have to pay higher rates of interest in the future than they did in the past. Some investors in public utilities, who, though they knew the financial structure of the organizations, have been shocked in the last two or three years to see their company paying as high as 10 per cent for the use of money, have wondered whether the business with the restrictions placed upon it by commissions and local authorities would return a net of 10 per cent. It is worthy of note to this class of thinkers to call their attention to the fact that funds which were obtained at these high rates did not constitute all the capital of the companies, but only a small portion thereof, and that taking into account the earlier financing at low rates the recent temporary financing has not seriously increased the average rate on all the capital involved.

The attitude of the state commissions during the war toward these utilities was very generally in the direction of making them wait for the higher rates which should have accompanied higher production costs. Indeed in some states the companies were actually forced to experience a loss before the commissions came to their relief, and then not appreciably. Of late, however, a more generous attitude has been shown toward the utilities, permitting them to earn not only a standard return upon the cost of the properties, but a return upon something like their present true value. The "hidden values" of public utilities have come to be recognized and brought into view just as in the case of the steam railroads. It has come to be accepted as a principle in establishing the fair value of these properties by the commissions that the present value is the fair value; that the properties have acquired greater value with the growth of communities and that properties constructed at low prices many years ago are entitled to an earning power based upon their present value, which is materially higher. The acceptance of this theory, coupled with a willingness of the commissions to constitute a commercial return upon the newly established values, points to the possibilities of earning power which will support the new capital required for extensions and substantial renovations.

Inasmuch as the utilities companies have all suffered for a long time from lack of facilities in getting capital, and as the new conditions have come all at once, the companies are either in the market or getting in the market for new capital, and their demand is coming en bloc, as it were, constituting from another angle a great demand upon the resources of the investing public. So far as there have been reorganizations of the financial structures of these companies, and so far as these are indicated, they are all upon a higher basis than prevailed in the early days of the industry, and are along the line of providing for a standard form of financing in the long future, under conditions of safety regarding the expenditure of these funds, that cannot be said to have prevailed in the early days, and which are characteristic of the similar conditions now prevailing in the steam railroad industry to which some attention will be given further along in this study.

Home and Business Construction

Fourth: The growth in the population of the United States and particularly in the cities calls for a larger investment annually in homes and business structures than is demanded for other purposes with which we are familiar. We sometimes lose our sense of relativity. Some years ago in a discussion between engineers of the vast amount of capital required to build the American railroads, and of the difficulty of getting contributions of that type of capital, a shock was given to the disputants by the statement of a matter-of-fact engineer, who held that, valued in terms of money, the labor, effort and expense of making the ordinary mud road systems of the United States represented more capital than was invested in the steam railroads. The need of housing being basic, it can be readily seen how great an amount of capital is required for the shelter of the people. Practically no serious amount of house building was done in the United States from 1917 to 1920, the reasons being the high price of material and the pre-occupation of labor. That has led to a positive shortage of homes and a most insistent demand for generous house building.

The construction of homes has become a general business rather than a matter of individual effort, so far as their financing is concerned and so far as their construction particularly relates to the growth of American cities. Where one home is built today by an individual user of the home, a hundred are built by marketers who have to provide the financing of the entire investment over a sufficiently long period to permit of the retailing on easy terms. At bottom the business of house building is financed by the real estate mortgage, a form of investment which while not actually reduced to statistics, consumes, normally, more money every year than any other single form of investment made in the country. The creation of mortgage credits in part payment, which mortgages are either held by the original owners or offered to other investors; the necessity of building loans, and the financial establishment of the building credit upon a basis of several years existence have all contributed toward making up the demand for money for real estate mortgage purposes vastly greater than the public sometimes credits.

Junior Securities Created

Furthermore, in the great cities the percentage of interest in the property which is mortgaged has been growing steadily greater. Where formerly a first mortgage was rarely given for more than 50 per cent of the conservative cash value of the realty and its improvements, we have a tendency today to extend the mortgage limit to 60 per cent. Meantime, in order to provide facility for purchase by the ultimate consumer, forms of junior credits have grown up. This was originally true in the East, where second and third mortgages added to the existing first mortgage constitute in the aggregate as high as 85 per cent of the cash value of the property. In the West these junior securities have taken the form of second mortgages and land contracts. Investment organizations have been built up which take these and peddle them out to the public either in units of the mortgage, or in groups representing the collateral of series of bonds, at a higher rate of interest than is returned by straight first mortgages. Whether these are good securities or not is not in point, although most of them really are.

What is to the point in this discussion is that the widening of the limit of mortgage security, whether senior or junior, has constituted a new demand upon public and private capital, which being properly dressed up and made attractive either by the process of periodical retirement of the principal by instalments, or the offer of high interest rates, is taking up a great deal of money and is constituting a demand which must be reckoned with.

Like the railroads and like the utilities, the building of homes having been interrupted for three years, an accumulated demand for new homes has come about which is very insistent and which is being prompted not only by the actual user but by people who are interested in the betterment of living and industrial conditions. The market for money is therefore likely to be attacked vigorously by the energetic people who are engaged in home building and the selling and buying of the same, so that for some years to come investors will have presented to them a very large field of choice for the placement of their money in real estate securities which, when all is said and done, must be recognized as being the favorite appeal to the American people for investment, owing to the strength of the security and the likelihood of the principal's being always safe.

During the war period an immense amount of corporate financing had to be done by industrial companies. The favorite method of doing this work was through the medium of preferred stocks, of which a very great quantity was marketed. In addition to this source of funds the banks were relied on largely for loans and many issues of short-term notes were made. Bank paper and short-term notes mature, and the tendency of the attitude of the banking system toward industrial and commercial organizations has been to require more and more closely every year the retirement of loans made to take the place of capital, making necessity for the fixing of capital and the using of bank resources only to handle paper liquidable at its maturity. The operations of the federal banks have impressed this principle on the local banks and during this period of re-organization a very considerable amount of fixed capital will have to be obtained to liquidate the long and short-term notes. At the moment preferred stock issues are not the vogue although they were very favorably received a couple of years ago. Some of the larger concerns have put out bond issues and this style is likely to be followed. At any rate, the indications are that for the next few years very large requests for capital of a fixed character will be made by the industrial corporations.

The prices which have been paid for the use of money, even in

What Our Buying and Distributing Ability Means to You as an Investor

In your choice of bond investments two factors are pre-eminent: first, their safety; second, their adaptability to your individual requirements.

The safeguards provided by our buying experts resulting from their extensive experience and specialized knowledge assure in our offerings, so far as is humanly possible, the first of these qualities—safety.

Our extensive distributing capacity provides a frequency and variety of new offerings which assure at all times a wide and diversified list of bonds from which every investor can make a selection exactly conforming to his individual needs.

The character, extent and variety of our offerings are best indicated by the issues herewith enumerated, representing a partial list of bonds in the purchase and distribution of which our organization has shared since January 1, 1921.

FOREIGN ISSUES

State of San Paulo 8%, Sinking Fund Gold Bonds, Maturity 1936.
United States of Brazil 8%, (non-callable) External Gold Bonds, 1941.
Province of British Columbia, 6%, Gold Bonds, 1926.
Kingdom of Belgium External, 6%, Gold Notes, 1941.
Government of the French Republic External 7½% Bonds, 1941.

RAILROAD ISSUES

Northern Pacific-Great Northern Joint 6½%, Convertible Gold Bonds, 1936.
Farmington R. R. Company 6%, Gold Bonds 1936.

PUBLIC UTILITY ISSUES

Public Service Co. of Northern Illinois 7½%, Convertible Gold Debentures, 1936.
Pennsylvania Power & Light Co., First and Refunding 7% Bonds, 1931.
Wisconsin Power, Light & Heat Co., Collateral 7% Notes, Series "C," 1931.
The Empire District Electric Co., First Lien & General Mortgage 8% Bonds, 1948.
Wisconsin River Power Co., 7% Collateral Gold Notes, Series "A," 1931.
Portland Railway Light & Power Co., First Lien & Refunding Mortgage Gold Bonds, 7%, Series "A," 1946.
Southwestern Bell Telephone Co., 7% Notes, 1935.
Southwestern Power & Light Co., 8% Bond Secured Gold Notes Series "A," 1935.

MUNICIPAL ISSUES

State of South Dakota General Obligation 4½%, 5%, 5½% & 6%, 1931-41.
Brown County, Wisconsin, 5% Highway Improvement Bonds, 1932-41.
Janesville, Wisconsin, 5% School Bonds, due April 15, 1932-41.
State of Oregon 4%s, 1926-40.
Dayton, Ohio, School Dist. 5%, 1940.
City of Cleveland, Ohio, School District 6% Bonds, January 1, 1932-41 inc.
State of Minnesota 5% Loan, 1924-1929.
State of Washington General Fund 5½%, Gold Bonds, 1941, optional 1931.

INDUSTRIAL ISSUES

The Goodyear Tire & Rubber Co. First Mortgage 8% Sinking Fund Gold Bonds, Due 1941.
Tennessee Corn & Fruit Products Co. First Mortgage 8% Bonds, 1932-39.
Kelly-Springfield Tire Co., Sinking Fund Gold Notes, 1931.
Gulf Oil Corporation Sinking Fund Debenture Bonds, 7%, Copper Export Association, Inc., 8% Secured Gold Notes, Feb. 15, 1932-25.

fixed capital of these companies, have come to be higher than they were in the past. Long-time note issues—and by this we mean issues running as long as ten years—and preferred stock issues carry on their faces an 8 per cent rate, although we are advised that the brokerage charges and other trimmings make this money cost those who borrow it pretty nearly 10 per cent. The industrial corporations are in a better way to pay higher prices for capital than either the railroads or the public utilities, because their interest costs can be added to the market value of their products, while this is not so broadly true in the case of utilities governed by state and national commissions.

Without going deeply into this phase of the demand for money, it is quite certain that the industrials will be competitors for the public's capital in great quantity during the next few years. If it should turn out that the excess profits and other corporate taxes levied by the federal government shall be mitigated as to their burdensome character, it is not at all unlikely that many companies will see their way clear to a reorganization of their financial structures along the line of fixing much of the capital now engaged, and which is carried in the form of bank loans or long-time note credits. This constitutes the fifth phase of the increased demand for public money.

Sixth: The likelihood of a change in the financing of the Government, whether it be from the funding of the existing federal debt into securities of much longer life than those now outstanding, or, as has been suggested in certain high quarters, the funding of the debt of the Allies of the United States into bonds which may be used to pay all the Liberty loans, seems to indicate that there will be more or less opportunity within the next two years for American capital which likes that sort of investment to place itself in government securities. This is not at all likely to take the form of increased public debt, but rather of conversion, and the operations in government securities do not seem to indicate that they will constitute a new demand upon the public capital. It is worthy of note, in passing, that the emission of the government securities during the war uncovered an unsuspected amount of wealth in the United States. People interested in finances of every kind were accustomed to say during the war that the sale of the government issues was a splendid education for the American people in teaching them the possibilities of investment of small sums. This was undoubtedly true but the experience of these holders of government securities since they have acquired them has also done another good turn, in that the holders have been taught to have fortitude during their experience of lowered prices in holding on to their property until it comes back to its original value.

There will undoubtedly be very large movements of blocks of government bonds in the future. In another portion of this issue a writer has made an illuminating statement of the great movements of government bonds from the custody of the large subscribers of an industrial class to the general investor. Those who remember the details of the issues of the Liberty bonds will recollect that every great industrial institution invested very heavily in them. The investments represented a high percentage of the capital which these organizations had for their ordinary corporate purposes. It was recognized that these investments made with corporate capital subscribed for and devoted to the production of commercial articles could not long continue to be held invested in low return government securities, and that such a movement as the statistician in another part of this paper has shown to have taken place must inevitably come about. That movement is likely to continue, but to the extent that it does occur it will be simply a shifting of capital rather than a demand for new money. Indeed the disposal of their government bond investments by the industrial companies cannot have any other effect than to alleviate the demand from the industrials themselves.

New government issues, however, made by the states and the municipalities, are selling to be the fashion. One of the financial results of the World War as affecting the finances of state governments has been the insistence upon state bonuses to the citizens of the respective states who entered the service of their country. In the case of the state of Michigan alone it requires $30,000,000 of state issues to provide the necessary funds to equalize the condition of the men who went abroad with that of those who stayed at home. Other states are making large issues, not only for this purpose but for public works, and that brings to the fore a phase of the security of state bonds as compared with other securities. That phase is that it is not possible to enforce the payment of state bonds. From the time of the repudiation of the Georgia bonds in 1873 it has been well established that a state cannot be sued for its debts, the federal constitutional limitations having been pretty well proved at that time, so that state bonds rest peculiarly and solely upon the moral character of the people who make up the state.

From this rather hasty review of the investment demands of the

future, which may not turn out to be any more exact than any other pronouncement about the future, because the gift of prophecy passed with the prophets themselves, it is proposed to make a few deductions. First of all, while these statements are general they can be particularly applied to Michigan as well as to the whole country, and it is with their applicability to Michigan that the paper is most directly concerned.

Michigan has a great need of new investment money for the purpose of the development of its municipalities, its railroads, its public utilities, its industrial corporations and the housing of its citizens. There is a great deal of money in Michigan that has never yet been charmed in the direction of safe and sane investments. These figures may not be exact but they are based upon fairly good information as to the offerings and tolerably good reports as to the takings, and we wish to impress them upon our readers. There is not a village of a thousand to fifteen hundred people in this state that does not average, year in and year out, a contribution of $25,000 to the cause of speculation. This is equally true of Ohio, Indiana, Illinois and Wisconsin, so that Michigan does not stand alone. Next, there is not a city of 4,000 to 10,000 which does not average a "blow-up" of $150,000 a year to enterprises which have no foundation in merit, no proper introduction from people of experience and no management by people of skill. Going a bit further, we venture to make this statement upon information and belief, that there is no city of 50,000 in Michigan that does not, year in and year out, give up a million dollars to enterprises which have no reasonable hope of paying. And when one passes cities of this size and gets into the class of thriving industrial communities like Flint, Saginaw, Bay City, Jackson, Lansing, Battle Creek, Kalamazoo, Grand Rapids and Detroit, the possibilities for the unskilled, thousands have whitened in the deserts and the mountain passes in which their luckless owners pursued their quest of the gold they never got. They forget that white every ounce of gold represents $21.67 of value, the $21.67 represents the energies and the labors and the hardship of all the people who mined all the gold and the rest who tried to get it and not merely the success of those who got it.

But there are smart people, too, who send their dollars into the beyond, and find big chunks of dollars, too, sometimes because their vanity is fed; sometimes because they are flattered into investment; but generally because they think they are going to get something for nothing, or at least, very many times the face value of the comparative nothings which they invest. For instance, what a fine lot of estimable business gentlemen in Michigan paid $50,000 apiece for front row seats in the directorate of Kansas City, Mexico and Orient, and what a fine lot of Michigan gentlemen sent their good money after bad in trying to recover the cash which Mr. John Heffron and Mr. Francis Palms lost in the mud of the levees along the Illinois shore of the Mississippi! And how many millions of Michigan money were put at the behest of "fly promoters" and oily-tongued "birds" who really made people believe that inexperience and amateurishness could make more money in the conduct of the telephone business than seasoned and experienced ability! Or is it necessary to recall how freely men without a knowledge of chemical engineering were endowed with the people's money to build Portland cement plants or to turn the muck of our Michigan marshes into briquettes of peat-coal which would have more heat in them than anthracite and less smoke than was finally left after the adventures blew up.

These investors constitute a class of contributions of the private wealth of Michigan to enterprises created by exponents of the theory that a sucker is born every minute. Their contributions will continue to be made forever and a day, when the people who have money devote at least as much thought to its investment as they do to its gathering.

Another Class of Investments

There is another class of investments into which the public is charmed and in which they have a better chance, but which, for the investor, represents a handicap to the investment from the moment that it is made. This is that class of enterprises in which the assemblage of the capital is burdened with too heavy a promotion expense in the gathering of it. There are certain classes of investments that are peculiarly rich men's investments. Time was when the business of insurance, both fire and life, was looked upon as an investment for the idle capital of wealthy men. A group of these met in the back room at a bank, decided that they wanted to organize an insurance company, subscribed the capital, paid for it at a hundred cents on the dollar, which actually went into the company's treasury, and set to work. These men had an advantage that has been held up to thousands of others in Michigan who thought they were doing the same thing. These thousands were solicited and besought and persuaded to put their money into similar enterprises in comparatively modest sums, the number of stockholders making up in

"When Commodity Prices Fall--"

On October 13, 1920, we used an advertisement in which this economic law was stated:

> When commodity prices go up, more money is required to move a given volume of goods. Hence, money becomes scarce and the price of money (the interest rate) goes up. As the interest rate goes up, bond prices go down.
> On the other hand, when commodity prices fall, the exact opposite is true; money is released, the supply increases and the interest rate goes down. The demand for bonds increases and bond prices go up.

Today—eight months later—a falling commodity market is demonstrating its inevitable influence on bond prices.

No one needs to be told that commodity prices are declining. That bond prices are steadily rising is proved by the lower rates of interest in the new security offerings, as well as by the published quotations of listed bonds.

Higher bond prices or lower interest rates—whichever way you care to look at it—mean the same to the investor as commodity prices do to the merchant. As prices rise, the merchant can buy less goods with a given sum—*the investor can buy less income.*

Various issues on our list, because they are now selling at a discount, yield a high income that makes them very attractive purchases. This income possibility will disappear as prices rise. Therefore, we suggest action now.

An additional advantage in buying now is the benefit to be had from the rising prices of bonds. Income is what the conservative investor buys—but he has made an even more profitable purchase when his bonds *increase in market value.*

That is the opportunity that exists today. We would be glad to discuss it with you if you will call at our offices. Or, if you wish it, we will send an experienced representative to you.

Let us send your our graphic charts showing the effect of commodity prices on the market for sound bonds. Ask for Circular MM-12.

volume what the individual subscriptions lacked in comparative size. The difference was that, where the rich man's subscription to the class of insurance company earlier referred to found its way into the treasury of the company at a full hundred cents on the dollar, the subscribed capital of the latter class of companies was stripped of from 25 to 50 per cent of the amount paid in for the cost of bringing it together. Now there may be some methematics in business which can make 65 or 75 cents earn as much as a dollar earns, under precisely identical conditions, but if there is, the information concerning it has not been given general circulation. Yet, in the face of this fact, from 1912 to 1917 not less than two millions a year of Michigan money was charmed into enterprises of this class, which began with a handicap of at least one point in a possible four. As a result, there are nearly a dozen weak insurance organizations in this state which are not even paying a commercial return on the par of the subscriptions made to them, although those subscriptions were made at the rate of two for one, and in the case of one of them, at least at the rate of three for one of the par, upon the assurance that the excess was to go into the surplus. As a matter of fact it went to the promoters; and the promoters are still out of jail.

Next, there is a class of investors who have been led to lose their money by being overloaded. Courage is a good quality in investment, and caution perhaps a poor one. Chances for results lie somewhere in the mixture of the two. During the real estate booms which have taken place in Michigan, and generally just before their climax, thousands of good people have been induced to take on, with comparatively small initiatory payments, and with modest but frequent periodical payments, rather more real estate than they had any business engaging. This statement applies to wholesale and retail buyers alike, for while the wholesaler was usually a man of some capital to start with, the retail buyers, as a class, were people who in making their engagements were discounting their future earnings. If by any chance the steadiness of those earnings were interrupted, the partially paid interest in their real estate ventures becoming unliquidable, suspension of payment was bound to follow, and with it forfeiture of the payments already made after the contract limit of delinquency had arrived.

This condition is not specially to be blamed to the sellers of such properties, because, as a rule, they have not profited by the delinquencies in payment but have rather, from their multitude, been embarrassed; because the sellers themselves depended upon the aggregate of the individual payments to meet their own as they became due. At any rate, they had the burden of carrying their properties thrown back on them.

By this process millions of dollars were lost to the buyers of real estate during 1892 and the years immediately following, during and following 1914, and more will probably be lost this year and in the succeeding years unless there is a very early resumption of industry. Even if there is such a resumption, these people will have to pay off in dearly earned dollars what they contracted to pay in cheaply earned ones. If they save the property they will have it and their experience to the good, and it is a matter of doubt which will be the more valuable possession in the end.

It is from a view of this panorama of hopeful but disappointed investment that this publication proceeds to a discussion of the relative merits of investments. The designer of this issue asked the writer of this article to stress the relative desirability of investments as between the various classes of securities which have been heretofore described as investment applicants for the capital owned by the people. The relativity of the safety of such investments can be readily summed into three classifications.

The first of these is: That the safest investment on earth is in earth, in real estate bought for cash or within one's means for paying for it in deferred installments, purchased at a fair price, either in a settled center of industry or a properly located and developed agricultural section.

Second: The next safest investment is other people's debts, properly secured, and that takes in the whole field of individual and corporate debt, whether it be that of the federal government, the state, the cities and villages, the railroads, public utility or industrial organizations, and to these rather more extensive consideration will be given further on.

Third: Investments in the equities of business, well-founded or giving promise, are good speculations, whose safety depends altogether on the adequacy of the invested capital, the experience of the management, the permanency of the market and the facility of the business to earn over and above a current commercial return upon the capital invested and surplus. This surplus must act as a buffer which will take up the shocks between realized losses and normally expected gains, which will be the granary in which the fruits of the seven years of plenty may be husbanded against the seven years of famine, and which will generally be the stabilizing fund between constancy of return to the investors and inconstancy of adequate income to meet the normal demands of the stockholders.

In the remarks which follow no attention will be paid to real estate as an investment. Its standing and the principles which would govern investment therein have been already sufficiently stated. The application of those principles furnishes a new case for every transaction.

The Desirability Of Public Utility Investments

PUBLIC UTILITY INVESTMENTS are comparatively new. They have come within a generation as a class. As a matter of fact, when the country was growing, capital had no confidence in the only public utilities, by which we mean municipal utilities which were offered. The investor did not believe they would pay. The only class of public utility investment offered was waterworks. A great many fine spun theories have been offered for the ownership of waterworks by municipalities rather than by private owners. Periodically some contributors to the gaiety of the nations who talk on this subject, like the editors of the Detroit News, or the present incumbent of the mayoralty of Detroit, tell their open-mouthed and empty-minded confidants that by some dispensation of grace in the past, waterworks became municipally owned in a general way because the city dads of the past were wiser than them that have come between their time and those of the present day politicians. As a matter of fact, there have been many privately owned waterworks, but these usually had to be attached to them some bonus to induce people to go into the business. The charter of the Bank of Manhattan, of New York City, is based upon a waterworks grant in the reign of Queen Anne, the bonus attached to the duty of providing a waterworks supply for the inhabitants of little old New York in those days being an opportunity to go into the banking business. New Orleans had a private water system for years, and, what must edify modern municipal fadists, the private sewer system as well. Louisville and Akron, Ohio, are examples of long continued private water systems, the latter being owned by that wise old financier of Detroit, since dead, Mr. Joseph Berry. There are half a dozen private water systems in Michigan today, but the reason that waterworks are generally municipal is that the country grew so fast and the demand for water supply and fire protection was so insistent and the call for the extension so rapid, once they did begin, and the likelihood of their paying out so remote, that people who had money would not invest in waterworks unless the taxing power was pledged to guarantee the investment. That is why waterworks are municipalized so generally and not because of any earlier superiority of wisdom on the part of the city dads who flourished when American waterworks systems were most largely inaugurated.

Before 1880 there were practically no issues of public utility securities such as we know today. It is true that there were gas companies and street railway systems. Gas companies date back as far as 1810 in New York, but prior to 1880 the American gas works was a clumsy, unscientific sort of thing which wasted half its raw material and got double prices for its result and product. From what we can learn of their financial structures they were nearly all organized with low capitalization and their extensions treated as part of their operating expenses, rather than a charge to capital. They were literally built out of their own bowels. When the Germans learned the hidden resources of coal tar and found in the refuse products of coal the fortunes that lay in the material of dyes, phenols and benzols and their derivatives and of the searchlight rays, when they found the wealth hidden in the ammoniacals, when their chemists discovered new illuminating values in the incandescents of earths and clay, the gas making business came into its own. Today the retail sales value of the products of a ton of coal is a fair stand-off with the cost of the coal itself, leaving the income from the gas distribution to support the capital costs, maintenance and personnel of the processes of distribution. The cheapening of gas to the public has raised within thirty years the annual per capita consumption in progressive American cities from 1,000 to 10,000 cubic feet, thereby creating a business of volume which did not originally exist.

The street car business was very much like the gas business in horse car days. It was usually capitalized low and its extensions were made out of its own bowels. The application of electricity in the late 80's, with prospects of economies figured so attractively as to lead everybody to believe that immense fortunes lay in the business—beliefs which were not realized; the anxiety of the newly organized

UNITED LIGHT & RAILWAYS COMPANY

Grand Rapids, Mich. **Chicago, Ill.** **Davenport, Iowa**

NO OTHER BUSINESS has withstood the press of adverse business conditions in so substantial a manner as has the Public Utility business.

Furnishing a service which is necessary to Industrial, Commercial and Home Life, the well-managed Public Service Company is least affected by temporary slackening of Industry and Commerce.

The product is consumed as it is manufactured.

It is paid for as it is consumed.

No surplus of goods is produced from high-priced materials, to be sold on a falling market.

While the demand for service in Industry may fall off in slack times, the use of Gas, of Electric Light and of Transportation in Commercial and Home Life *must continue on about the same scale.*

On the other hand, the price at which the service is sold must be sufficient to pay the cost of producing and delivering such service, *and a return on the investment adequate for the attraction of capital.*

This ultimate safety of principal, combined with a fair return for the use of capital, should interest the conservative banker and investor.

United Light & Railways Company has never failed, in the eleven years of its history, to pay every interest charge on the day it was due.

It has never failed to pay, in cash, on the first day of every January, April, July and October, a quarterly dividend of 1½ per cent (equal to 6 per cent per annum) on its 6 per cent Preferred Stock.

There is a ready market everywhere for the securities of this Company.

electrical manufacturing companies to promote and get business; the earnest eagerness of municipal officials to grant franchises for electrical transportation when the old horse car grants were on the verge of running out, and the prevailing cheapness of investment money at the same period all conspired to bring about an enormous investment in electric transportation.

The development of the electric light was almost coincident. How many people recall that it is less than forty years—to be accurate, it was 1884—since the first arc light of the brush type was shown in Detroit, although Vandepole had shown an experimental candle nine years before that? These investments in the electric street railway and the lighting business have had their ups and downs. During periods of low priced coal and moderate priced labor they have made a commercial return upon the money invested in them. It is probable that if scientific accounting methods had been applied to them from the outset, this would not have been the case, because anyone at all familiar with the conduct of the business since its inception can recall scores of cases in which real operating expense was charged into construction, or, what was worse, operating losses covered into capital. The history of the street railway and lighting business has been one of a succession of obsolction of plant, all of it, however, having tended toward the perfection of central station practice, the development of long distance transmission and the continued increase in the economy in the production of electric energy, its distribution and the efficiency of its use. We seemed to have settled down to standard practice in the construction and operation of plants using electrical energy, whether for transportation, industrial power or lighting purposes, and with the settlement has come greater security for the capital invested in the business. For a long time the public mind, at least so far as it was directed by the yellow newspapers and the red politicians, was centered upon the constant reduction of rates. Indeed so able a document as the Wisconsin law regulating public utilities seems to have been written wholly upon the theory that rates might ever go down. Recent experiences have shown, however, and in most parts of the country the theory has been accepted, that public utility service must be compensated by rates which will pay the cost of providing the service, maintaining the fabric of equipment and returning an attractive income to the capital involved.

The public utilities have not been good investments in the recent past when taken as a class. They have had to do considerable makeshift financing, but one thing has been brought out clearly during their recent period of hard luck, and that is their necessity, a characteristic which becomes more and more impressive as one studies the statistics of demand for the services which they render, not only the gas companies but the street railway and lighting companies have generally been given adequate rates, this betterment of conditions being part of the history of the last two years. With the drop in the price of coal from war time rates and the prospective return of the cost of labor to something approaching ante-bellum prices, with the revival of industrial demand for their services there seems little question that the public utility corporations are coming back into their own, and that their bonds, their preferred stock and their long-term notes are safe investments for conservative people. Their hardships have brought about one condition of advantage to the present day investor, and that is, so much of their current earnings have had to go into plant within the last five years that the proportion of security to the aggregate of issues is greater today than it ever has been before.

The Desirability Of Governmental Securities Investments

AS ALREADY INDICATED, there is likely to be a very great demand for money in the next few years from the various forms of governmental organizations which administer public affairs. The likelihood of public transactions in bond issues of the American national government has already been discussed along the lines of the unlikelihood of the demands of the federal government involving the use of much new money. From what can be forecast in this division of public finance it looks as if the operations would be along the line of conversions rather than of new emissions.

Government securities which are most likely to offer themselves to the American public in the form of new issues are likely to be foreign demands for money. This is comparatively a new kind of investment for American capitalists. Yet it is not unlikely to prove attractive. Continental Europe is "broke" financially, and those who are our best students of American business have taken the view that in order that Europe shall get upon its feet it will be necessary for us to lend money to her governments. This does not mean that the money itself will go abroad, but that the money will be spent in the United States for the products of American manufacture which

Digitized by Google

Europe needs, and that the proceeds of the bond issues of the European countries will be spent here. Already there have been some examples of this form of foreign financing. During the war the great Anglo-French loan was put out in this country on practically this basis, much of it having been already repaid. French cities, like Paris, Lyons and Marseilles, have put out their local securities for various purposes and in considerable amounts, which are still in existence here. Right at the present time the French government is making a new loan, which the newspapers say has been pretty well taken up.

These securities are being put out to net approximately 8 per cent, which is a high rate of interest, based on the necessities of the borrowers and not necessarily upon their lack of credit. It is unlikely that a nation like the French would ever default upon a so-called external loan, because while such a loan could not be enforced in its collection by legal methods, the ways of trade operate to make it necessary for nations to pay to the citizens of each other what they have borrowed. A very interesting example of this is contained in the recent news from Russia, to which our government lent directly some three hundred millions of dollars before the old imperial government went "belly up," was succeeded by the soviet government, and had its earlier obligations repudiated by the latter. Now Mr. Lenine and Mr. Trotzky are said to be inviting a return of the capitalist system, having decided that the socialistic system leads them nowhere. That means that they are going to get into export and import again, but before they do that they will have to make some arrangement for the security of the debts which they owe the United States or they cannot trade with us; so that composition of the debt is inevitable.

If we as a nation are to do much trading with the rest of the world, we are going to have to take a great deal of its debt in the next two years, and the offerings of foreign securities will become really a part of our own industrial system, so that a citizen of Michigan who has money to invest and who is interested in the industries of Michigan can perhaps do them and himself a very good turn by investing some of his spare cash in these foreign securities. In that event he will do well to take the advice of the investment bankers, because their judgment is better seasoned than that of other buyers, and they are not likely to undertake the distribution of foreign securities which are not safe, even though they be attractive so far as interest rates are concerned. It may be fairly premised that securities emanating from other countries, like Great Britain, France, Holland, Belgium, Spain and perhaps Italy, will be well grounded in credit; while securities emanating from the countries which have to be re-constructed, like Germany, Austria, Poland, Jugo-Slavia and the minor nations, will really become the subject of substantial guarantees before they are attractive to the general investor. It is not unlikely that even these will be attractive to their own nationals—that is to say, to people who have emanated from those countries and who are now included in the citizenship of the United States. The love of fatherland will lead to investment by these where nice decisions as to security might not be entirely conclusive.

While considerable demands may be looked for from these sources for investment in national securities, our greatest demands are going to be from American states and cities. The American states have been singularly free from debt for a long time. Until recently many of them had constitutional prohibition against going into debt, our own among the number. Of late it has been the expressed judgment of our people that certain large financial transactions are worthy subjects of debt making. The most striking of these are the road-making programs which have been entered into by various states in this country. Another which seems to call for a great amount of borrowed money is the theory of paying bonuses to soldiers of the World War for the purpose of equalizing their loss of opportunity during the war with the opportunity of the men who stayed at home. Already in Michigan something like 20 millions of road bonds have been issued or are on the way to issue, the eventual limit of this class of debt for this state being 50 million dollars. Already authority to issue 30 millions for bonus purposes has been given, so that here is an eventual demand for 80 million dollars from a single state. The demands from other states will be in proportion. Now it is well to remember that a state cannot be made to pay its debts. It is sovereign and may not be sued in its own courts or in the federal courts without its consent, and all that the investor who invests in state bonds has to depend upon is the good faith of their people. Of course in Michigan we know each other well enough to know that this state is not going to repudiate any of its obligations, yet in the past the states of Georgia, Mississippi, Tennessee and North Carolina have repudiated their debts, and by waiting long enough have been able to get into the market for new credit, so that for Michigan investors at least it may be good policy to confine their purchases of state bonds to the

state of which they themselves are a part and whose policies they and their neighbors can influence by their own votes.

The great field, of course, from which the demand for money is constantly coming is that of the municipalities, the term being used here in its broadest sense to include cities, villages, counties, school, road and drainage districts, and the other forms of municipal government which may be from time to time erected. Indeed in order to devise new ways of making public credit possible, a tendency has grown up in late years of forming overlying municipalities each capable of making its own debt. For instance, when Chicago was overburdened with debt and there was a necessity for the drainage canal, the credit of the city of Chicago was not invoked in procuring the money necessary for that purpose. A new municipal corporation was organized, including not only the area of Chicago but of much adjacent territory, to become the basis of the credit of the sanitary district bonds. By this means the one set of properties was made the basis of credit for two sets of municipal issues. It is not unusual to find that school districts have a right to pledge the credit of the property of their areas for their securities, a recent example of that demand having come right in the city of Detroit from its Board of Education, which was formerly dependent upon the consent of the city government itself for the use of credit for educational purposes. In practice the territory which is benefited by the presence of a waterworks system is made the credit giver for the debt necessary to produce and extend the system; although a water system being a remunerative public utility cannot be classified in the same group of investment as sewers, schools, fire halls and other non-remunerative investments.

Next, it used to be the style to put out municipal securities only on permanent properties which could at least live out the life of the loan. Under the commission form of government which has become more or less popular in recent years there have been some divergencies from this policy. In order to show that the "city dads" were keeping down taxes they have thrown certain forms of public expense on the public debt; for instance, we know cities in Michigan which have issued their bonds running for thirty years to motorize their fire departments and have spent the proceeds of the issue upon public property having a life of from five to seven years. In other words, the property acquired by debt will not survive until maturity of the bond issues. These issues are not worthy of encouragement because sooner or later these cities will get the financial belly ache and will have some trouble meeting their interest promptly, when heavy interest payments, intense public demand for improvements and statutory tax limitations are taken into account.

Next, under our new-fangled ideas of municipal ownership of public utilities, provision is being made in the law for the issuance of straight municipal bonds for primary installation up to a certain limit; after which another class of bonds may be issued, secured only by the fabric of the utility itself. So far we are not aware that any great number of this class of issues has been marketed or that the necessity for offering them has come into existence. But when it does come about and such offerings are made, the ordinary buyer will owe it to himself and his capital to distinguish clearly between the utility bonds issued on the faith and credit of the cities and those issued with the fabric of the utility as their sole security. In the latter case it is likely that the investor will only be inviting trouble, because when that stage of the utilities come their earning power will probably not take care of the interest, and they will have the general characteristics of privately operated public utilities that have got into trouble.

This of course is only the blue side of investment in municipal securities. As a rule they are better supported by credit than either government or state bonds. If it were possible to conceive that the Government or the state could lie down on the payment of the interest or principal of their issues, there is no method of court action that can be invoked to make the Government or the state pay. Not so with the municipals. These corporations pledge their taxing power and when they default, as they sometimes have done, the courts can be invoked to force them to levy a tax to meet both principal and interest all at once. So that the security on municipal bonds is actually invokable for collection.

Most American cities which go into debt are limited to the tiniest fraction of their assessed valuation so far as debt making is concerned. Formerly the rule was approximately 2 per cent of the assessed value of the property subject to taxation within their limits. Lately there has been an advance from that very conservative limitation, but the wildest variation that we know of has not exceeded 10 per cent. Inasmuch as few American cities are valued at more than an average of 60 per cent of their true cash convertible value, it will be seen that even this highest rate does not exceed 6 per cent of the true cash value of the communities which ask the general investor to accept their credit. This is interesting to the investor only to the

Digitized by Google

extent that he wants to know that his interest is being paid cheerfully and that it does not become a burden upon the taxpayers. As a general rule investors may go blind in investing in municipal securities which have sinking fund provisions made in connection with their issues. Or be it known that many issues of municipal securities have been put out in the past without any provision for their payment. Of course they have refunded into new issues and the like at the maturity of the old ones. But it does not add to the saleability of a municipal bond to be obliged to admit that while it was properly issued, has a good interest return and splendid credit, no provision has been made for paying the principal when it becomes due.

For certain classes of investors, such as guardians, trustees and administrators, who have long-time trusts to administer, and for educational and charitable trusts, the municipal bond is about the safest kind of investment they can make. While they may go it blind, as we suggested, in the selection of their investments, and remain safe, there is still enough variation in credit and the characteristics of the issues for buyers to be willing to take the judgment of the investment houses in their selections. This should be done if for no other reason than that such judgment carries with it an assurance of the legality of the issue. The making of public debt is no haphazard adventure and must be done according to the law. There have been cases where the formalities required by the law have not been complied with, and while the majority of the people of the community remain undoubtedly favorable to the carrying out of the contract, sometimes a grouchy taxpayer has invoked the courts to prevent the carrying out of its evident purpose when some of the necessary legal steps have been omitted. The investment houses look after this feature as a rule and use lawyers for that purpose who specialize on the subject and who are therefore more than ordinarily familiar with defects in an issue where they exist. So that municipal bonds, which includes counties, school districts and the like, and which excludes issues made for public utility purposes when based upon the credit of the utility alone, and which also excludes issues for which sinking funds are not provided, are bound to be perfectly safe investments for surplus money. Of late they have become very attractive as to interest return. Whether this will continue when the country has accumulated a fresh supply of capital and there is more money available or not, remains to be seen.

The Desirability Of Industrial Securities Investments

IN THE PRELUDE to this review of the availability of securities there was included a suggestion of industrial issues as a separate class. It is really remarkable what a change has come in the organization of the finances of American industry in the last few years. The old style corporation was a purely common stock enterprise, and such of those as survive still are characterized by being built up on the one-class stock basis. That is a survival of the actual ownership of the property by the people who are at its head. With the consolidations which began a quarter of a century ago the variety of interests in industrial companies which have been created has become very great. Indeed it is really surprising in the cases of some of the companies to see how little the controlling interest actually owns. This is not the result of any evasion of responsibility but rather of the great growth of many of these companies and the insistent demand for fixed and casual capital, which come to them as the result of the ordinary growth of business. Take any great American manufacturing institution and it will be found that its financial organization is something like this: a bond issue secured by all its property acquired or to be acquired; a preferred stock issue having a lien upon the net earnings of the company after the bond interest has been paid; an issue of long-time notes, the proceeds of which became necessary after a closed preferred stock issue was exhausted, and the principal and interest of which are payable prior to the liquidation of principal and interest of the preferred stock, although when the preferred stock was put out its buyers were very certain that they were getting a second lien; perhaps an issue of short-time notes, and after that the current banking transactions in which current income is pledged to their liquidation.

Adventures in industrial corporations do not belong in the field of the casual investor. As a rule they should be made only by people familiar with machinery and business, and, as a better rule, only by people familiar with the machinery and business in which they invest. For general investment their bonds are good, so far as security is concerned, but their plants are specialized, and if by foreclosure they fall into the bondholders' hands it means that they must go into the

FEDERAL BOND & MORTGAGE COMPANY

Phone Cadillac 5989 526 Griswold Street, Detroit

The sum and substance of every effort of this company is to provide sounder, safer, better First Mortgage Real Estate Serial Gold Bonds. Each day our business continues is a replica of the day before—a renewed and changeless adherence to the high principles upon which this institution was founded years ago.

(416)

business themselves and find people competent to run their plants, which is a helpless kind of a proposition at the best. Yet these concerns are going to need money, and investment in them is really a matter of public duty; so that the best that can be said of them is that the prospective buyer should depend upon his broker and his lawyer in making such investments. As they are not all bad by any means, they are not all good either. The intricacy of analysis of their statements is something which appeals more to the professional than the amateur can be best undertaken by him.

Much of betterment in the attractiveness of these properties has been accomplished by the recent inauguration of banking house control. This has been exhibited in a number of reorganizations of motor car companies. Industrial companies frequently require large sums of money and banking house alliances permit of the speedy use of current assets for temporary credit purposes. On the whole, the industrial is an investment to be undertaken by people who can afford to lose money if they have to; by people who keep the run of general business well in mind, and especially by people who know the particular business into which they are putting their money.

These admonitions apply only to the real investor who wants to put his money away for a considerable time, with the hope of realizing a regular and respectable income upon it. They do not apply to the investments of those who go into the stocks and out of them to take a scalper's profit dictated by the changing quotations on the ticker tape. Any fool can do that, and whether he makes or loses money by it is not of much public moment.

The Desirability Of Real Estate Securities Investments

THE POPULATION of Michigan has increased by more than 20 per cent in the last ten years. This increase has not been spread over the farm areas in due proportion, but has been almost wholly amassed by the cities. The cities of Detroit, Saginaw, Bay City, Lansing, Jackson, Battle Creek, Kalamazoo, Flint and Grand Rapids account for more than 60 per cent of the growth of population in Michigan between 1910 and 1920. As a consequence, they also account for the very great demand for new homes which has accrued, and the very largest amount of which has accrued within the last five years and is to a large extent still unsatisfied. For reasons which have been hitherto discussed in these pages not much building has been done since 1916. There is therefore the accumulation of demand of the last five years for new homes, minus the amount to which it has been satisfied by actual building, minus also the relief of demand which has come from the departure of workers and their families from the state as the result of the industrial depression. It used to be said by the extremists that Detroit alone was 45,000 houses short of the actual demand. This was never true, but a maximum unsatisfied demand for 35,000 homes once did exist in that city. The best figures that we are able to put together from the information given us by associations and correspondents is that, taking Michigan by and large, there is today a demand for 65,000 new homes in the state. At an average cost of $3,500 each, which is about that now prevailing, this means that there is a call for more than $22,000,000 of new capital to be invested in home building. The average capital of the builders and the buyers of homes does not exceed 20 per cent of the finished cost of the product, so that there is call for approximately seventeen and a half millions of new money to catch up with the demand for homes, and of more than half as much more annually to provide for the 40,000 homes which should be built annually in the cities of Michigan to keep up with the growth.

Investments in securities based upon home-building, real estate and industrial buildings and apartment buildings, which we have not included in the foregoing figures, call for very much larger sums of money from the ordinary sources of supply. The ordinary sources for such supply are the savings banks, which aim to keep a large proportion of their deposits in first mortgage securities. These institutions have not of late been investing to any great extent, for two reasons. The one and most pressing has been the reduction of the aggregates of savings investments. The other has been an unwillingness to accept the figures of cost which have characterized the last few years as figures of permanent value; so that by the time the real estate mortgage banker got property values reduced to what he thought was likely to be their permanent level, and was ready to lend 50 per cent of that figure, he had got down to 35 or 40 per cent of the actual cost of such construc-

Our Bonds Will Pass Any Test

Q.— What is the security back of your Bonds?
A.— Each Bond is a unit of a closed First Mortgage on a specific parcel of improved income producing Detroit property worth in all cases double the amount of the total Mortgage Bond issue.
Q.— On what kind of properties are your mortgage bonds issued?
A.— Apartment houses located in excellent residential neighborhoods and business blocks on good business streets.
Q.— Are your bonds tax emempt?
A.— Yes, as all our bond issues are secured by First Mortgages on Detroit property, our bonds are free from all local and State taxation. Normal Federal income tax up to 4% is paid by the Mortgagor.
Q.— How do you guard against depreciation in the mortgage property?
A.— A portion of the Mortgage Bond issue is paid off each year, thereby constantly decreasing the amount of the mortgage obligation and steadily increasing the margin of safety.
Q.— What rate of interest do you pay?
A.— 7%.
Q.— Why do you pay 7% while several other houses pay only 6%?
A.— Your money is worth 7% in the current market due to present business conditions, and due to the fact that there is strong demand for American funds by foreign Governments and Municipalities. We would feel that we were not dealing fair with you if we paid less than 7%.
Q.— Are 6% First Mortgage Bonds safer than your bonds that are yielding 7%?
A.— Absolutely not—The bonds we offer at 7% are the same class of bonds we formerly sold at 6%—In fact some of these bonds are unsold portions of our 6% issues.
Q.— What are the resources of your Corporation?
A.— Over $7,000,000.00.

DETROIT MORTGAGE CORPORATION

Third Floor REAL ESTATE EXCHANGE BUILDING *Main 9482*

Digitized by Google

tion. The savings banks have not, therefore, been any relieving source of supply to the speculative and private builders who have lately been willing to make adventures in real estate investment, whether for sale, rental or personal use.

In the last few years a new class of institutions for the gathering of capital and its release for real estate investment purposes has come into being. These are the so-called finance or mortgage companies, which, not coming under the purview of the state banking laws, are quite free to take a more liberal view of the amounts which they may lend upon real estate security. These companies put out two classes of investments to their savings subscribers, namely, the entire amount or subdivisions of the first mortgages upon which they lend usually 50 per cent of actual present-day costs, while for their preferred stockholders investments are made in what is practically good second-mortgage security, the actual owner starting off with a 20 or 25-per-cent interest in the properties, while he is amortizing his debt in monthly payments, after the form of rent, but usually at a much higher than rental rate. These securities are self-liquidating, and require from four to eight years for the home-getter to pay off his equity, when he still has the mortgage to attack and pay off.

The mortgage and finance companies, where they are well managed, pay a handsome return to those who put their money into them, and, in addition, serve the useful purpose of collecting from the resources of many small capitalists a large portion of the great sums annually required in Michigan for the provision of new homes for its people. As a matter of fact, these are the only available places in which good returns can be obtained on such small sums as $100. Some years ago the public utility companies issued some $100 bonds for the purpose of attracting the capital of the small investor, but we have seen none of these in a long time, their places being filled by offerings of preferred stock of those companies to the general public. The mortgage companies look for the investment of the small capitalist as well as those of the large one, and it is worthy of note that their solicitors emulate the life insurance agents and the real estate men by the thoroughness with which they canvass the public. Some of their critics in the larger amount investment trade are inclined to turn up their noses at their fine-combing processes, but it is worthy of note that it is just such processes as are saving that capital of the thrifty worker and the small tradesman from being charmed into fly-by-night and blue sky investments, usually never to return. The mortgage companies are in most cases furnishing the only safe and available investment, returning the normal return to the small investor that is available to that class of investor. Indeed we are not sure that, for the person who enters deliberately upon the financial program of buying a home, the mortgage corporation investment, as an initiative, is not a better way to undertake his program than by loading up on contract real estate, which may overwhelm him when he is only partially paid up. A thrifty and saving person can accumulate his money under the mortgage plan in units of a single hundred dollars, with no liability ahead of him if reverses come, and with liquidable security when he is ready to undertake home purchasing.

The method of subdividing mortgages into fractional beneficial interests in the entire mortgage is a financial convenience, and if buyers select the properties into the securities of which they buy they have frequently as good a chance to select their investments as if they were buyers of the entire mortgage debt. An instance of the oddities and at the same time the safeties of such investments came to attention only a while ago. A guardian, having accumulated $500 for his ward, looked over a list of mortgage interests offered by one of these companies. Much to his surprise he was able to buy such an interest in a property located less than a block away from his own home, of the security of which he could and did have personal knowledge. Much more to his surprise he discovered on inquiry that all the other interests in the same mortgage were held by neighbors of the mortgaged property, some of them not even acquainted with the other, but all brought under the operations of the system, into investing their little surpluses in the immediate vicinity of their own homes.

These securities are now paying 7 per cent. How long that will last is uncertain. They have always been good at 6 per cent. The preferred stocks of these companies, which is only another form of real estate investment, usually pay 7 per cent and are as a general rule well secured by a margin of assets over and above the stock liability and can be bought in amounts as low as $25. They are the backbone of the real estate mortgage investment business and where well conducted, are just as good investments as railroads or public utilities, besides being a mighty sight nearer home, as a general rule.

The Desirability Of Steam Railroad Investments

THE American steam railroad as an investment has had a rather honorable career, despite the criticisms which have been put upon it. For a time the railroads were the plaything of speculators in their stocks; for a time the management of some railroads felt that construction jobs should pay them a profit. In the cases of railroads built before their justification had arrived, the people who subscribed and paid for the stocks lost their money. This was because such enterprises really needed bonuses, and the loss on the stock subscription was usually made up by the appreciation of the other property of the stock subscriber.

Investments in American railroads from this time forward are apt to be not only more remunerative than they have been in the past, but safer.

To begin with, the days of wild speculations in railroads are over. There is not an American railroad of consequence whose stock control is not tucked away safely in some banking house or held by some group of conservative business men, or controlled in some similar way to prevent speedy and unexpected changes in its ownership.

Next, it is not possible today for any group of railroad operators to "milk" the properties over which they have been given charge. The period of government control made such operations offenses against the government and led those managers who were accustomed to milk their properties, to become mighty weary.

Again, the proceeds of bond issues and preferred stock issues go into the railroads nowadays and not into construction company profits. Construction contracts used to be mighty handy things to hand out to "phony" construction companies composed of railroad officials. The Clayton act took care of that to the limit.

There can be no inconsiderate debt-making since the control of issues went over to the Interstate Commerce Commission. It is true that in many states the public service commission have long had such control but they have not had it long enough to have made the condition general. The recent federal legislation gives the United States government through the Commerce Commission, control of the expenditures for new property. This means an assurance to investors that their money is being spent on their security of investment rather than in profits to operators.

And speaking of security, there has come to be a better appreciation of values of railroad properties upon which, under regulation, they are legally permitted to earn a standard legal return. In the appraisal of American railroads, begun before the late World War, and now being resumed, figures of hidden values are being constantly disclosed to be added to the aggregate of values upon which an income may be obtained. These hidden values are not unreal. For instance, a general look over of a railroad property in the light of today may show a piece of track upon an embankment which appears now only as an earthwork; yet the history of its construction may be that the well settled embankment of today was constructed over a bog which had to be mattressed and pile-driven till the cows came home, before stability was accomplished. That was an investment upon which income should be returned; but with loose records, bad accounting and changes in management or ownership much of this investment was lost sight of. In the new appraisals these cost items are being uncovered where possible and made to reappear in the aggregate upon which net income may be legally earned. Moreover, under recent decisions affecting fair value, steam railroads, equally with public utilities, are being permitted to earn upon the appreciations of value which have come to property which has appreciated. The logic of this was a long time in being recognized. Users of railroad service were ever willing to have depreciations recognized and taken out of the aggregate upon which income might be earned, but what was sauce for the goose of depreciation was not, until recently, held to be sauce for the gander where appreciation was concerned. What this is going to mean to railroad properties can be estimated when one considers the constant growth in value of terminals in our cities gathered in with wise provision when the railroad systems were young, defended, extended, improved, grades separated and developed for the industries which have come to them. These terminals are not priceless but they have a constantly appreciating value, which the courts have recognized as being entitled to earning power, from the constantly increasing volume of business which they serve.

These conditions mean that from this time forward steam railroad bond issues authorized by federal authority are going to be safe and remunerative investments, with a constantly increasing margin of security, and that the readjustments of finances which take in the underlying bond issues, and take up the makeshift financing of the re-

So the People May Know

Rents Will Not Come Down Until Buildings Go Up

S. W. Straus & Co. Offers Capital to Finance Construction at 6%

IN VIEW OF THE HOUSING SHORTAGE that exists in Detroit and elswhere—and the vital need of relieving this shortage in the interest of public welfare—S. W. STRAUS & CO. will make loans at SIX PER CENT in the form of first mortgage bond issues to assist in financing the construction of modern apartment buildings IN AMOUNTS OF $200,000 AND UPWARD.

This policy is put into effect because there exists a menace to public health, morals and national security, growing out of the existing lack of sufficient and proper homes for people to live in. It is our contribution to the cause of humanity—our response to the call of patriotic duty.

We, therefore, invite those who have deferred building projects for one reason or another to avail themselves of the service we are ready and most eager to give. Architects, engineers and contractors are urged to advise clients, who have been contemplating building that all meritorious housing projects conforming to our requirements and safeguards can be financed immediately through this House.

Building costs have receded from 15% to 25% below the peak of 1920. Many commodities have been reduced as much as they reasonably can be, and prices of some materials, which have gone under cost of replacement, will rise again when demand increases.

Build now is our advice. It is economical, safe and profitable.

The underlying cause of the housing shortage and the paralysis of the construction industry has not been the high cost of labor and materials—although, to some extent, they may have been contributing factors—but the lack of sufficient capital to finance construction. Rents are high because SUPPLY IS SHORT and DEMAND IS GREAT—and rents will remain high until supply is equal to demand. In other words RENTS WILL NOT COME DOWN UNTIL BUILDINGS GO UP. Buildings cannot go up until they are financed, and they will not be financed until the money is provided. This is the whole story in a nutshell.

Plainly, the logic of the situation is this: The public should, for the time being, at least, invest its savings and surplus in the safe real estate mortgage or mortgage bond, or it will continue to suffer from lack of homes and constantly rising rents. Those who need a home and are financially able should build for themselves. Those who are fortunate enough to have a comfortable home should LEND THEIR SAVINGS so that others not so happily situated may have a place to live.

There is something else to be thought of in this connection. Stagnation of the building industry has prevented the proper flow of general business. Restore building activities by helping to finance them, and there will be an immediate revival of every industry in the land. Thousands of men and women, now unemployed, will go back to the shoe factories and the textile mills. Railroads will be given freight to haul from forests, mills and mines, and money will be placed in the hands of the consumer to buy the products of the farm, now locked up in warehouses and granaries because there is no demand. Every human activity will be benefitted, and prosperity will return almost overnight.

We believe that money for building should be borrowed at SIX PER CENT. That is all a mortgagor should be asked to pay.

We will make loans ONLY on the best projects—those which meet the requirements of the STRAUS PLAN. Because of our nation-wide organization and a clientele of tens of thousands of investors, who rely upon us to furnish them with safe investments that will never cause them a moment's anxiety, we can market a large volume of such loans.

Our Message to the Builder is:

If your project is sound, we will lend you the money to finance it at SIX PER CENT.

Our Message to the Investor is:

If you are looking for safety—and safety is what every man and woman wants in the investment of their savings—then the question of high yield should not take precedence over that which time and tried judgment have taught the experienced investment bankers.

Our Experience Extends Over Thirty-Nine Years Without the Loss of a Single Dollar to Any Investor.

cent past are going to be permitted to earn from the rates charged for services, their interest in addition to a reasonable amount for interests of the stock class.

This does not mean that the general and casual investor is advised to put his money into the railroad stocks. That is an investment for the specialist and the person who has time, intelligence and taste for the observation of railway management and the many items that enter into the prosperity of railroad systems.

THUS we come about to the conclusions from which we started: That there is going to be a great public demand for money; that this demand is going to come from the railroads, the utilities, the requirements for housing, the various forms of government and the industrial corporations, and that they are all good proportionally, except that some are apt to cause a little more grief than others. The counsel that we have been giving has been that of taking the advice of those who know the business and who from daily contact with issues are able to recognize upon the face of them amplitude of security, experienced management and public demand for their products or services. After all, the choice of these securities as favorites in investment depends largely upon the individual buyer. So there you are.

Michigan accumulates a great deal of wealth in the way of fresh capital annually. Michigan has a demand for a great deal of new annual investment. Michigan people owe it to their state and to the property which they already possess to invest their surplus funds, without being ultra provincial, in the securities of their own neighborhoods. Such investments will react favorably upon the property holdings which they already possess. In addition there is always a convenience in being near enough at hand to the location of one's investment to enable him to see how his money is being blown in, if that is what is happening to it, so that a stopper may be put upon the process before all the capital is gone. It is true that far-away cows have long horns, but those nearer at hand are easier to get to market. If Michigan's enterprises which need money could have put into them every year the sums which are wasted on blue sky propositions, the industrial supremacy of the state could be maintained without question. Too much money goes in this direction.

There are first of all the deliberate promotors of money-getting propositions which have no conscience behind them. There are the thousand-to-one shots which are pure gambles. There are the investments made at the behest of the "handy men" of communities, by which we mean that class of unskilled people who know how to make an affidavit or draw a deed, and whose wisdom is so much superior to that of those who trust them that they are readily made blind leaders of the blind.

Some day the investment bankers and brokers, as the result of a long campaign, will drive these people out of the field and the business of investment will be guided by skilled people to whom the general public will look with the same spirit of selection as they do for decent mechanics to repair their watches. If that period ever arrives the reason for it will be found in some such classical statement as that of the late Governor Bliss, "Eddication done it, me boy, eddication done it."

What Does the Future Hold for Liberty Bond Owners?

"What Will Most Benefit the American Holders Is a Completely Stabilized Condition of Trade"

By S. MAYO BOYD

Secretary of C. F. Childs & Company

ANYONE who attempts to prognosticate future values of Liberty bonds or to answer the question, "When will the 4¼s go to par?" must take account of a number of factors encompassing roughly tax revision on the one hand and rehabilitation of world commerce on the other. It is not probable that Liberty issues can advance in price substantially without repealing the excess profits tax and modifying the super-income tax schedule. Fortunately there is good reason to believe that this much-needed reform will be supported by fair Congressional majorities and will soon become a law. On the other hand, U. S. bonds can hardly sell on a better basis than at present if the few remaining embers of dependable credit in Europe are to be extinguished by the militaristic plots which now alarm business men in England and America (to say nothing of the neutrals) possibly resulting in a complete breakdown of order on the Continent.

The fiscal recommendations recently made by the Secretary of the Treasury, Mr. Mellon, ought to be thoroughly understood by bankers, merchants and manufacturers, to the end that every Congressman and Senator representing industrial communities may be given plenty of first-hand evidence from his own constituents as to the harmful effects of present taxation methods upon local trade and industry. The necessity of the hour is to direct the flow of capital, as formerly, into industrial channels through the purchase of industrial, utility and railroad securities. Every bond salesman knows how frequently investors are accustomed to remark: "I am all through buying anything except municipals; I can't afford to pay the super-tax." It is safe to say that if super-tax rates were cut in two there would spring up at once a new and healthy demand for Liberty 4¼s on the part of well-to-do investors who now shun them altogether. The policy of our Government in not to create any further issues of fully tax-exempt securities, and in consequence, when the national treasury proceeds to borrow, it is obliged to play second fiddle to obscure counties and cities. By following Mr. Mellon's recommendations Congress would be able to ameliorate the conditions which are compelling the proprietors of large incomes systematically to unload their taxable investments (including Liberty bonds and Victory notes) in order to buy municipal bonds. Otherwise it will soon be generally remarked, with accuracy, that "Mr. So-and-So is far too rich to pay any federal taxes at all."

Collateral to the reform of our federal taxes is the policy which the treasury may be expected to pursue in refunding the Victory Loan, which matures in May, 1923. It has been proposed to issue three and five-year notes, thus somewhat relieving the pressure of governmental borrowing in the short-term money market and disposing of a certain amount of floating debt, at least for several years to come. The rates to be offered on the proposed three and five-year notes will not likely be so high as to cause any depression in the market value of the long-term bonds. Yields obtainable by investing in the various 4¼ per cent issues at present prices vary from 5.20 per cent to 5.90 per cent. It can hardly be hoped, therefore, that the proposed new three or five-year notes will bear less than 5 per cent or 5¼ per cent.

Prospects of stimulating our declining export trade through a revival of the pre-war European demand for our goods are not encouraging. Given foreign trade conditions that afford our producers of raw material and manufactured goods an opportunity not only to liquidate their present holdings but to market their future production as well, we might expect to see a considerable amount of permanent investing in 4¼s. But, unfortunately, such conditions do not now exist. On the contrary, the decline in our exports persists to a most disheartening extent. There are those who treat "foreign" considerations with scorn when it is suggested that European prosperity has a bearing upon the price of Liberty bonds; but they will all learn in time. The sooner America, as a creditor nation, realizes that the only way a debtor nation can pay its external loans is by the creation of balances abroad through excess of exports over imports, the sooner our national policy will take on a character suitable to the economic

predicament in which we find ourselves today. Our existing manufacturing plant capacity is probably twice as great as our domestic consumption can utilize. In April our exports were down to $340,000,000, as compared with a monthly average of $686,000,000 in 1920. American agents in South America uniformly report the virtual impossibility of selling American merchandise in that market, while at the same time regretfully admitting the difficulty of obtaining payment for goods previously shipped to South American purchasers. On account of our national inexperience in dealing abroad, and the unfortunate inadequacy of our past diplomacy, the hot-heads on the Continent are reducing business to a state of virtually total paralysis and lowering the standards of living to such an extent that the disparity between the living conditions of our own manual workers and the workers of Europe may soon be comparable to that existing between American and Oriental labor before the War. What chance can our exports have in foreign markets against articles made by highly skilled and intelligent European factory workers who are being obliged to exist on a mush and water diet?

Our only hope lies in co-operating with those abroad who are opposed to any more military raids upon the limited areas where coal and iron deposits are concentrated. We must insist upon the orderly upbuilding of Europe's industry and commerce; and any forces, whether traditionally friendly or otherwise, that persist in thwarting such a development must be over-ridden as tactfully as possible, but nonetheless as resolutely as necessary. The new Administration at Washington may be relied upon to pursue the proper course to a successful conclusion, provided an intelligent public opinion can be built up to support the inevitable program for the protection of American interests which must sooner or later be presented to Congress.

The remarkable strength of the demand for United States Treasury Certificates of Indebtedness cannot be interpreted as an indication of an expanding supply of free capital for permanent investment. It indicates rather that working capital is idle for the time being, and gives warning that with the first sign of renewed industrial activity temporary funds will rapidly find their way back again into industry to finance American products from producer to consumers, both domestic and foreign. There is nothing upon which to "peg" the recent high prices of industrial plants and similar capital assets except their continued profitable use; and in order to keep them employed foreign outlets for their products are indispensable. Without an industrial revival these values cannot be maintained, and renewed investing in United States Bonds cannot be expected to account for a very large amount of the floating supply so long as property owners are obliged to charge off capital losses in plant, inventory or real estate account. It becomes increasingly apparent that without a revival of our trade there is no great probability of Liberty bonds selling on a much better basis than they are today, which is only another way of saying that if European conditions do not speedily improve, investment capital may be expected to become permanently more difficult to obtain.

What will most benefit American owners of Liberty Bonds is a completely stabilized condition of trade. Those who are still carrying bonds for which they paid par would like to see the value of their collateral speedily restored to par. But when no adequate supply of new capital is being created, what chance is there for that to happen? The statement can be made with confidence that our Government's 4¼ per cent bonds cannot be worth par until the creation of new capital through nation-wide industrial activity induces active competition for 4¼ per cent taxable investments. It is not agreeable to force oneself to face such barren realities as these, but if a realization of the facts once becomes general throughout the American business community, the voice of our Government will be heard abroad in unmistakable terms—thus bringing results. America is not primarily interested in European boundary disputes except insofar as conditions for doing business around the world are disturbed. But an end should be made of the widespread belief that America is not alert to back up the forces of order and thus to protect her own foreign trade.

How to Figure Yield of a Bond or a Stock

How Time Element and Premium or Discount Affect the Actual Return on the Investment

FREQUENTLY the expression "to yield 7 per cent" or "on a 7 per cent basis" is heard in connection with the bond business. Most everyone knows that $70 annual income on an investment of $1,000 is a yield of 7 per cent. This holds true in cases of dividend-paying stocks because stock never "comes due" or matures except in special cases. Thus if I pay $900 for ten shares of stock which pays an annual dividend of $70 I need only to figure the percentage of income against cost to find yield. In this particular instance the yield would be $70 divided by $900, or 7.77 per cent.

In Case of a Bond Below Par

But suppose I buy a bond with a face value of $1,000 which pays an annual return of $70 and I happen to purchase the bond for more or less than $1,000. If I pay less than $1,000, or less than par, my yield will be more than 7 per cent on the cost thereof because at maturity I will collect the difference between cost and $1,000, in addition to collecting the principal. For example, suppose a $1,000 bond bearing 7 per cent having 20½ years to run is purchased for $900. The holder will receive annually 7.77 per cent on cost, and at maturity will receive $100 additional, which has a certain diminishing present worth at each interest period during the life of the bond. So at each interest day the present worth of the $100 to be collected at maturity is theoretically added to the interest actually received. By means of logarithmic computation we can tell exactly what fraction of a dollar should be added in such cases. There have been made up for use of investment bankers a comprehensive set of tables, known as "bond tables," which are consulted to find this information. By use of the tables, therefore, we find that the value of the $100 collected at maturity when spread out over the 20½ years of interest payments brings the actual yield of the bond in question up from 7.77 per cent per annum to 8 per cent per annum.

Conversely, suppose you agree to purchase a bond running 20½ years, bearing 7 per cent interest with par value of $1,000 at a price "to yield 8 per cent." How much should you pay in this case? Would you figure out what sum at 8 per cent yields $70 per year? No. You would do that only in case of stocks, in which instance the price would be $875. But in this case you would pay more than $875 because at maturity you will collect the difference between cost and par and that sum has a present value. From the tables below we learn that $900 is the correct price.

In Case of a Bond Above Par

Here we find ourselves paying more at time of purchase than we can collect at maturity; yet the bond contract provides for 5 per cent interest. Using a specific case, suppose we are purchasing a $1,000 bond bearing 5 per cent semi-annual interest, having ten years to run and for which we have agreed to pay $1,081.80. What in this case will be the "yield"? Our problem immediately becomes one of finding how much of each $50 received annually as interest must be considered as a sort of sinking fund to take care of the $81.80 premium, and how much is actual interest. By referring to the sinking fund tables below we find that $3.13 invested every six months at the same interest that the bond pays amounts to $81.80 at the end of ten years; therefore out of each annual $50 received on the bond, approximately $6.26 must be considered as the part set aside to cancel the $81.80 premium. The remainder, $43.74, is real interest on the amount invested ($1,018.80), or is in fact 4 per cent per annum. Thus a bond bought under these circumstances would be "yielding 4 per cent" or "on a 4 per cent basis."

The reverse of this case figures out the same way. Suppose a contract is made with a bond man to buy a $1,000 bond bearing 5 per cent semi-annual interest on a "4 per cent basis." What price should be paid? As shown above, the price should be one that will permit of the annual $50 return covering exactly 4 per cent on the price to be paid during every year the bond has to run and enough more to retire the premium. The reasoning is the same as in finding "yield." By referring to the tables we find that the price is $1,081.80.

Below are given the values of bonds and other securities bearing

interest at 5, 6 and 7 per cent, payable semi-annually, maturing at periods from six months to ten years, on varying bases of return on the investment. Note: For finding values or yields where lower or higher rates are given, the larger tables must be consulted. Most bond houses carry tables which give a range from 3 to 8 per cent interest and yields of similar range. These limited tables are given here largely for illustration.

*The figure referred to in description.

Are Present Blue Sky Laws Accomplishing the Desired End?

IN THE DAYS before we had blue sky laws and securities commissions—and which, by the way, were days when we did not have laws governing nearly every natural human activity—it was the opinion of many legislators that if only we invented some method of looking into securities selling schemes before the public was solicited, fraud would stop. So we passed the blue sky law and we created the securities commission. And the act of the legislature in so doing was only one of many similar acts intended to legislate honesty into business. Moreover, if you take all the government employes, both state and national, who are employed by the taxpayers in one way or another in a nervous endeavor to force human beings to avoid trespassing on the rights of their neighbors and figure up what it costs in taxes, you will find no doubt that the observations of a certain Southern negro were about correct when he said: "If we keep on making laws and hiring inspectors to 'force' them laws, it won't be long until half of the people will be supporting the other half to have themselves watched."

Every time a man is drawn out of industry and taken into government service he becomes, in his relations to the producing population, a liability instead of an asset. And if the work he performs does not positively add to the well-being of the taxpayers at large, he becomes therefore a parasite on society.

But referring back to the blue sky matter. The enforcement of this law is an example of what we are talking about. We doubt if much worse swindles could have been worked had there been no law on the statute books these last few years—and this is not in disparagement of the good which has been done.

"There is no doubt that there is need of a strong official control over an element in our midst which does not hesitate to take advantage of the poorly informed portion of the public, through the medium of fraudulent and misrepresented securities, but even under state laws the difficulty of curbing the abuse is great," says Howard F. Beebe, vice-president of the Investment Bankers Association of America. "The Association, of which I am chairman of the legislative committee, has given a vast amount of thought to the subject and has been in active co-operation with the state and federal authorities, and

Digitized by Google

through its study and activities it has been led to the conclusion that the type of law which would be most effective is not that coming under the generalization of 'Blue Sky' but one which will seek out and punish fraud and misrepresentation."

Here is a most vital suggestion. And the application of the principle to stock selling is the proof of it. Were it better to set up a labyrinth of rules and regulations of conduct which an intending crook may comply with technically, yet in the end accomplish his purpose and go scot free, or rather had we not better leave the field open for men to try out their wits and at the same time provide a way to seek out and punish fraud and misrepresentation? If we must have some kind of a government agency to deal with this particular brand of misdeeds let us have federal legal machinery to act as the people's counsel—a special breed of state's attorney, as it were, which will punish counterfeit stock sellers with the same efficiency that counterfeit money makers are restrained.

Continuing, Mr. Beebe writes: "The former type of act (blue sky) through its mandatory provisions upon the administering officials has caused a great deal of expense and trouble for the legitimate interests in proportion to its effectiveness on the offending element; and with equal administrative ability and energy it is believed that much better results can be secured from the type of fraud act which is in existence in Maryland, and which has been decidedly effective in that state through the co-operation of the legitimate banking interests there. After careful thought and consideration a somewhat similar act has just been passed in the state of New York and is expected to receive the signature of the Governor. It is conceded by those who have given most careful attention to the subject that for both legal and practical reasons a federal statute would have to be of the fraud act type and would have to be designed to attain the closest co-operative relations with the various state officials. It is trite of course to say that no law is effective unless it is energetically administered, but from the very nature of the work involved with either a 'blue sky' or a 'fraudulent securities' act it is necessary to maintain an organization of highly expert people, and the costs of the operation under a federal act as distinguished from that of a state are bound to be in geometrical proportion as there are states.

"It was due consideration of the foregoing facts which led the Investment Bankers Association in previous years to advise against hasty action and not to pass laws until assurance could be had that very substantial appropriations would be forthcoming. The machinery of the Federal Reserve System reaching so promptly all sections of the country would no doubt be most effective, and it is believed that both the Federal Reserve Board and the various banks would be glad to aid in every way possible. The Investment Bankers Association can be depended upon to continue its active co-operation, and no doubt the American Bankers Association will be equally glad to lend its assistance."

(Mr. Beebe is vice-president of the Investment Bankers Association of America and has been chairman of the legislative committee of the Association three years. In this capacity he has been and continues to be in very close touch with blue sky matters both in the states and at Washington.—The Editor.)

A Word About Covert Act Road Bonds

THE INVESTING PUBLIC has heard much about road bonds since Michigan went into road building on a large scale. There are investment bankers who class these bonds among the most desirable investments and there are those also who do not as yet give them the same standing as straight municipal bonds issued against the full faith and credit of a city or other political subdivision. It may interest our readers, therefore, to go briefly into some of the peculiar features of these bonds.

Under the Covert Act a county which adopted the so-called "county road system" may, through its county road commission, issue bonds to finance the improvement of its highways, commonly known as the Covert Act bonds. When 60 per cent of the property owners along a particular stretch of road petition to the county road commission for the improvement of such road, such commission holds meetings to determine the desirability of making such improvement, the property to be contained in a district to be directly assessed for the benefit, the amount that each piece of property in the district should pay for the cost of such improvement, and the amount to be assessed by the county at large and various townships.

After hearings are held on these assessments and usually after

An Efficient, Proven Service for Investors

Long Established

During a period of more than forty years this house has provided efficient service for many thousands of investors.

Private Wire System

Our offices in fifteen principal cities are all in direct charge of partners or our own managers. The close co-ordination of our facilities is fully maintained by our private wire system.

Foreign Connections

Our foreign department is in direct constant communication with our correspondents in London, Paris, Amsterdam, Antwerp, Brussels, Buenos Ayres and other foreign markets.

Investment Service

We carry a line of investment securities, carefully selected to meet the requirements of individual and institutional buyers, which includes foreign and U. S. Government, municipal, railroad, public utility and industrial issues. Our list will be sent on request.

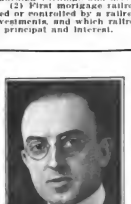
What Is a Legal Investment For Michigan Savings Banks?

"There Is Scarcely a State Banker Who Has Not Been Confused or Mistaken Regarding the Qualifications"

By J. M. CONWAY



Deputy Commissioner of the Michigan Banking Department

THOSE directly connected with state banking in Michigan, either from the operating or supervisory position, are wont to laud at times the splendid provisions of the Michigan banking law which have been largely responsible for the excellent record of Michigan's state banks during the last decade. In some respects the Michigan law is unique, and it is to such characteristics, particularly, that most attention is drawn by those expounding the merits of the Michigan system. Guided by the costly experience of Michigan bankers in the early "wild-cat" days, the legislature in 1887 laid the foundation of a banking system which, in my estimation, is second to none. There is one outstanding keynote in the law from its inception, which is summed up in the one word "security." As legislatures have succeeded themselves, amendments have been added but the security and conservatism of the banking law has been strengthened rather than weakened.

One of the most important and perhaps the least understood portions of our banking law is Section 27, which, after prescribing the legal reserves to be maintained against savings deposits, clearly outlines the classes and qualifications of investments in which the remainder of the savings deposits must be invested. I dare say there is scarcely a state banker reading this article who has not been confused and mistaken regarding such qualifications. It is not improbable that he has been unceremoniously informed by the examiner that his qualifying savings investments were short of requirements, when he had been confident that this phase of his business would not be subjected to departmental criticism again at this examination. This lack of definite understanding of the qualifications of legal savings investments is not surprising. The law is rather technical in its detail, and while it is the general opinion that a legal savings investment is as safe as is humanly possible, not all secure investments qualify as legal for savings funds. An investment which will qualify in the broad sense as a legal savings investment may not qualify as a so-called "three-fifths required savings investment" in the narrower sense, as outlined in Subsections A to K inclusive of Section 27. A glance at the history of this section clearly indicates the development of the several classes of investments to that point of ultimate security which in the public mind warranted their establishment as a legal savings investment for Michigan savings banks.

THE AUTHOR of this article has had an extended connection with the banking department of Michigan, having been successively chief clerk, examiner and deputy commissioner. Owing to the fact that there has been much misunderstanding on the part of both bank men and bankers as to what investments come within the provisions of the Michigan law governing the investment of savings deposits, we believe our readers will find much of value in this article.

In addition to his experience with the state banking department, Mr. Conway was connected with the Federal Reserve Bank of Chicago in the department of examinations. It is felt that he is especially well qualified to speak on the subject he is here discussing.—The Editor.

J. M. CONWAY

The system of Michigan state bank supervision, as we now understand it, was established by Act 205 of the Public Acts of 1887. Originally, Section 27 provided that a savings bank should maintain a legal reserve of at least 15 per cent of its total deposits, and that *two-thirds* of the remainder of such savings deposits should be invested in United States government or municipal bonds, provided that such municipalities had not repudiated their debts within the ten years preceding such investment, and provided the total indebtedness of such municipalities did not exceed 5 per cent of their assessed valuation, except by a vote of two-thirds of the board of directors, when such bonds might be purchased if the total indebtedness did not exceed 10 per cent of their assessed valuation. This two-thirds of the remainder might also have been invested in negotiable paper secured by any of the above mentioned classes of security, or in notes or bonds secured by mortgage lien upon unencumbered real estate worth at least double the amount loaned. For the time being we will not concern ourselves with the manner in which the board of directors was authorized to invest the remainder of such savings deposits. The class of investment above mentioned was not optional, but it was mandatory upon the board to invest two-thirds of the savings deposits after the 15 per cent reserve was provided in securities qualifying under the above classes.

The first amendment to this section occurred in 1889, when the *two-thirds* of the remainder was changed to *three-fifths*. This fraction providing for the legal investments remains in our law today, and it is to securities qualifying as investments for three-fifths of the remainder of deposits to which reference is made in the common phrase "savings required three-fifths investments" or "savings legal investments."

The law was again amended, but this time in minor detail, in 1891, and was then allowed to rest until 1905, when to United States government, municipal bonds, first mortgages and negotiable paper secured by the above were added, under proper restrictions, the following classes of securities:

(1) First mortgage railroad bonds under proper restrictions regarding earnings and assets pledged.

(2) First mortgage railroad bonds whose lines are leased, operated or controlled by a railroad whose bonds would qualify as legal investments, and which railroad guaranteed such securities both as to principal and interest.

(3) Refunding and improvement first mortgage railroad bonds if approved by the securities commission created to act upon same.

(4) First mortgage bonds of electric railways, gas, electric light or power companies in Michigan, if approved by the securities commission.

(5) First mortgage steamship bonds under restrictions given, and provided approved by the securities commission.

It is interesting to note that although Section 27 was not amended allowing the investment of savings funds in railroad bonds until 1905, an amendment was passed to Section 52 in 1899 which removed from the limitations of this section investment in the legally authorized bonds of certain specified railroad companies. Such bonds could be carried in any amount not exceeding in the aggregate 20 per cent of total deposits, and not more than 5 per cent of such deposits could be invested in the bonds of any one railroad. It is because of this amendment that the Department does not criticise the carrying of railroad bonds as legal savings investments, which have not been approved by the securities commission, provided the bank's investment was made prior to the coming into effect of the 1905 amendments to Section 27 and the establishment of the securities commission in the same year to pass upon such investments.

Minor amendments were made in 1907 and 1913 but it was not until 1919 that public opinion and business practice had advanced sufficiently to warrant the following important changes:

The required legal reserve was reduced to 12 per cent of savings deposits, and to the class of required three-fifths legal savings invest-

MUNICIPAL BOND INVESTMENTS

Municipal Bonds are safe; principal and interest being secured by the taxing power of municipalities.

Municipal bonds are exempt from all Federal Income Taxes, including the Sur Tax. Michigan municipals enjoy as well, freedom from all local and State taxes. No ownership certificate is necessary in collecting interest on municipal bonds.

They command a ready market, are easily salable for cash, and are held in high regard by bankers as collateral for loans.

The return is generous considering safety, tax-exemption, and marketability.

We specialize in Municipal Issues which are Legal Investments for Savings Banks in Michigan.

List upon request

KEANE, HIGBIE & COMPANY

431 Griswold Street

DETROIT

Digitized by Google

ments—already established—the following were added:

(1) Legally authorized bonds of any Michigan road district organized under the provisions of Act 59 of the Public Acts of 1915 and amendments, commonly known as the "Covert Act".

(2) Mortgages which did not exceed 60 per cent of the value of improved farm property and 50 per cent of unimproved. The upper limit for a qualifying mortgage on city property remains at 50 per cent of the valuation.

(3) Accepted drafts or bills of exchange, having not more than six months to run, growing out of transactions involving foreign trade or growing out of transactions involving domestic shipments of goods, provided shipping documents are attached, or provided same are secured by warehouse receipts, or other documents securing title, covering readily marketable staples. In this connection the acceptances of any one person, firm or corporation shall not exceed at any time more than 10 per cent of the bank's paid up capital and unimpaired surplus. The aggregate amount of such acceptances cannot exceed the bank's capital and surplus.

Regarding the required three-fifths qualifying savings investments, therefore, the qualifications remain in a general sense as given. It would be of little value and a useless waste of endeavor to attempt to give in detail all of the technical provisions of the law regarding the qualifications of a security to make it a three-fifths legal investment. We have outlined the history of this section to date in an endeavor to emphasize the apparent paramount desire of the legislators to secure, as nearly as possible, absolute safety for savings funds. It should be clearly kept in mind, however, that a technicality of a certain bond issue or mortgage, while perhaps not affecting in any way the prospects for ultimate payment at maturity of both principal and interest, would disqualify it under the law as a three-fifths savings investment. Thus a municipal bond which, instead of pledging the entire faith and credit of the municipality, gives as security the assets of a publicly owned utility, such as a water plant, is not deemed as a qualifying three-fifths legal savings investment.

Further, in order that the banking department may have means of knowing of the proper execution of mortgages securing bond issues, and in order that it may have access to the documents at any time with the idea of affording most absolute protection to the mortgage bondholders, it requires that the mortgage must be trusteed by a Michigan trust company. Thus a first mortgage real estate bond trusteed by a bank or trust company outside of Michigan does not qualify as a required three-fifths savings investment unless co-trusteed by a Michigan trust company.

Up to this point we have been discussing investments of the three-fifths of the remainder of savings deposits after the legal savings reserve is taken care of. There are, however, other investments which, while not qualifying as required three-fifths investments, are nevertheless qualifying investments for the remainder of savings deposits after the reserve and required three-fifths savings investments are cared for.

A summary of the general characteristics of the several classes of savings investments follows, technical details, however, being omitted. In the event of uncertainty on the part of the banker I would suggest that reference be made to the specific provisions of Section 27 before purchasing a railroad, steamship or electric railway, gas or electric power bond to carry among his qualifying required savings investments.

(1) Twelve per cent of savings deposits must be maintained as legal reserve on hand, or with approved reserve banks or trust companies, or invested in United States bonds.

(2) Three-fifths of the remaining 88 per cent or 53 per cent of savings deposits must be invested as follows:

(a) In United States bonds; or

(b) In properly authorized municipal bonds of any municipality in the United States, provided that the total indebtedness of such municipality does not exceed 5 per cent of its assessed valuation, except by two-thirds vote of the directors, when such bonds may be purchased if the total liabilities do not exceed 15 per cent of the assessed valuation; or

(c) In legally authorized "Covert Act" road bonds; or

(d) In legally authorized first mortgage railroad bonds with certain technical provisos (see Section 27); or

(e) In the first mortgage bonds of railroads whose lines are leased or operated or controlled by any railroad company specified in the above section (d), if such bonds are guaranteed by the railroad company by whom the lines are leased or controlled; or

(f) In the legally authorized refunding and improvement railroad bonds under certain technical provisions, and provided the issue has been approved by the securities commission; or

(g) In the legally authorized first mortgage bonds of any electric railroad, street railway, gas or electric light or power company organized in Michigan, provided such bonds qualify under certain technical provisions regarding earnings and general condition of the company, and provided that said bonds have been approved by the securities commission; or

(h) In legally authorized first mortgage bonds of steamship companies, with certain provisions regarding capacity of steamboats, and provisions for security, and provided that such bonds are approved by the securities commission; or

(i) In the negotiable paper secured by any of the above named classes of securities; or

(j) In notes or bonds secured by mortgage lien, upon unincumbered real estate worth at least double the amount loaned, except on improved farm property the amount loaned shall not exceed 60 per cent of the value of the property; or

(k) In accepted drafts or bills of exchange having not more than six months to run, growing out of the importation or exportation of goods, or resulting from domestic trade, provided shipping documents or warehouse receipts securing title covering readily marketable staples accompany.

The remaining 35 per cent of savings deposits may be invested as follows:

(1) In notes or other evidences of debt, the payment of which is secured by the deposit of collateral security of known marketable value worth 10 per cent more than the amount so loaned, and interest for the time of the loan; or

(2) May be invested in notes secured by collateral deposited in a Michigan trust company; or

(3) May be deposited in any approved reserve bank; or

(4) A portion of said remainder, not exceeding twice the capital stock, may be invested in unsecured negotiable paper approved by the board.

(Wherever mention is made that investment must be approved by the "securities commission" before qualifying as savings legal investment, it refers to the "securities commission" provided by the banking law, consisting of the commissioner of banking, attorney general and state treasurer.)

The Future of Foreign Bonds in This Country

By LOUIS MERZ

Manager Foreign Department, First and Old Detroit National Bank, Detroit

THE FUTURE market for foreign bonds in this country is not easy to predict. The history of marketing foreign securities in England and Holland and some other European countries long ago proved that foreign securities find a ready market in that country only which makes investments in the debtor countries. England, with its vast insular possessions and its immense business under its control, is probably the largest investor in foreign securities. Then come France, the Netherlands, Belgium, Germany and to some extent the Scandinavian countries. Southern Europe, always capital poor, did not cut a figure in foreign investments. One of the great secrets why England succeeded in maintaining its world trade was its great investments in foreign enterprises—public utilities, such as waterworks, railroads, elevators, etc.

Before the war it was just as easy to float an issue of Brazilian railroad debentures or Australian railroad bonds in London as to sell a London & Southwestern bond. These issues were usually underwritten by one or a group of stock banks and the marketing was undertaken by one of the large investment houses of London, and the bonds usually were listed at the Exchange and could be disposed of as readily as other securities.

The Netherlands is another shining example of the value of investments. Holland with less population than the state of Pennsylvania, has investments running into the hundreds of millions of dollars in foreign securities, which is a noteworthy fact when one considers that a small agricultural country with few industries and natural produce barely able to sustain its population should have been able to direct a great amount of its resources in foreign countries. But, of course, the Hollanders have had great revenues out of their East Indian possessions. And they are frugal and saving and they could easily afford to direct a good portion of their surplus to foreign countries.

But on the other hand we are not in the same relative position to the rest of the world that England was, far instance, to the United States following the Civil war. We became a creditor nation almost over night, and in the process we did not accumulate a legion of foreign customers and the money due us is not of private individuals in these foreign countries which collectively now owe us $10,000,000,000 or thereabouts. England became a creditor nation through years of effort, and when she arrived at her goal she had in her strong box thousands of American stocks and bonds instead of a few government I. O. U's. And then add to this problem the exchange difficulties of the foreign purchaser and the foreign borrower and the unwarranted high cost of production in this country and it is not clear to me how there can be a very promising market for foreign securities until foreign trade gets back on a normal basis. In other words, we cannot hope to have much market for foreign bonds until we have a normal foreign trade.

How Long Will The Opportunity Last To Buy Bonds At Present Prices?

There are indications in plenty that it will not last long.

Conditions created by the world war and its aftermath, which resulted in lowest average bond prices in a generation, are rapidly changing.

ALREADY commodity prices,—measured by wholesale and manufacturers quotations,—have dropped on the average more than 33 1-3%. (Commodity prices and bond prices generally move in sympathy with but in the opposite direction to each other.)

ALREADY every Federal Reserve Bank in the United States has lowered its discount rates.

ALREADY the ratio of reserves to liabilities of the entire Federal Reserve Banking System have increased from about 42% about a year ago to over 57% today.

ALREADY the volume of bills under discount with the Federal Reserve Banks has decreased by about a thousand million dollars from the maximum.

ALREADY the Bank of England and other central reserve banks in foreign countries have lowered their discount rates.

The above factors are generally regarded as reliable indications that interest rates are trending downward.

Those desiring to secure bonds at present low prices and high interest rates should act promptly.

We submit for your consideration the following issues, subject to prior sale or advance in price:

	Rate	Due	Yield
Richland County, S. C. (Columbia, Capital of State, is County Seat)	6%	1922 to 1946	6%
Maricopa County, Ariz. (Phoenix, Capital of State, is County Seat)	6%	1930 to 1949	6%
Dyer County, Tenn.	6%	1951	6%
Wapakoneta, Ohio	6%	1924 to 1942	6% to 5.75%
Hickory, N. C.	6%	1924 to 1935	6¼% to 6½%
Canton, N. C.	6%	1923 to 1948	6¼% to 6½%
Orangeburg, S. C.	6%	1961	6%
Govt. of French Republic	7½%	1941	8%
Prov. of Ontario	5½%	1922	7½%
Prov. of Manitoba	5%	1923	8%
Prov. of Saskatchewan	4%	1923	8½%
Saskatchewan Guaranteed	4%	1939	7½%
Detroit Edison Co. 1st & Ref.	6%	1940	7.10%
Rivoli Realty 1st Mtg. Realty	8%	1922 & 1931	8%
Belmont Apartment 1st Mtg. Realty	6%	1922 to 1931	7%
Detroit Edison Deb.	8%	1931	(About) 7.80%
United Kingdom	5½%	1937	(About) 7%
Kingdom of Belgium	8%	1941	(About) 8.10%
Govt. of Brazil	8%	1941	8%

Descriptive circular on any of the above securities, will be mailed on request.

The 1921 M. B. A. Convention

THE thirty-fifth annual convention of the Michigan Bankers Association will open Monday, June 6, at the Hotel Statler, Detroit. Judging from the acceptances already received it is estimated that the attendance will run upwards of 300 delegates.

President John W. Staley has some new ideas in mind about how a convention should be conducted. These, no doubt, will be an agreeable surprise to the delegates. Of late years the tendency has been to drift into an excess of entertainment as compared with the amount of time and effort devoted to the current problems of the banker. Speakers sometimes have given too much effort to subjects of sociology and political reform rather than devoting themselves more strictly to discussions of the things that bankers come into contact with every day.

And there are also those members who feel that the number of speakers has been too great. As a prominent banker from the Upper Peninsula said last summer at Ottawa Beach, "I would not care for a convention without entertainment features, but the model convention is one which gives the banker a chance to find out how the other fellow solves his troubles; and if half the time is taken up with talks on religion, politics and other subjects outside of the scope of banking, I don't get my money's worth."

It is a peculiar circumstance that this is the fourth serious business depression through which the banks have passed during the life of the Michigan Bankers Association. And bankers all over the state are going to come to this convention looking for counsel and guidance more seriously than ever before. Thus it seems certain that whatever changes may be made by President Staley in the usual program will be heartily indorsed by the delegates.

One of the problems a country banker is going to inquire about is how to keep some of his farmer customers in business when many of them already have borrowed to the limit and are going to ask the banker for permission to spend some of their crop money for new clothes and automobiles. The speakers and their topics follow:

Monday afternoon—John S. Drum, president of the American Bankers Association, "Michigan in Relation to General Conditions and World Trade."

Tuesday morning—Willis H. Booth, vice-president of the Guaranty Trust Company of New York, "Foreign Credits and Their Relation to Agriculture," and Robert B. Locke, vice-president of the American Institute of Banking, "The Present Day Banker's Responsibility to Bankers of the Future."

Tuesday afternoon—Ruston Ruston Joe, former editor, Oriental Review, Bombay, India, "New Era in India," and Prof. David Friday, University of Michigan, "The Future of Interest Rates."

The address of welcome will be delivered by Mayor James Couzens, of Detroit, and the response will be made by Gerritt J. Deikema, Holland, president of the First State Bank of Holland and former president of the bankers' association.

Mrs. H. M. Brown, secretary of the Association, is hopeful about the large attendance and says she will be surprised if the total is less than 500. She says that following each address there will be an open discussion, in which all members will be invited to participate.

The Michigan association now numbers more than 700 member banks, having grown from a nucleus of 125 member banks at the beginning of the organization in 1887 when a handful of Michigan bankers met in St. Joseph on August 11. Those present at that meeting were B. F. Parks, of the First National Bank of Paw Paw; O. O. Jordan, of the Union Banking Company of St. Joseph; C. S. Jones, of the G. W. Jones Exchange Bank of Marcellus; C. J. Monroe, of the First State Bank of South Haven, and G. W. Merriman, of the Exchange Bank of Hartford. The formal organization followed at a meeting at the old Russell House, in Detroit, October 28. Henry Hannah, Traverse City, was elected president; Albert Ives, Detroit, first vice-president; Wellington R. Burt, Saginaw, second vice-president; F. W. Hayes, Detroit, secretary, and Silas B. Coleman, treasurer.

Mr. Hayes served until 1896, when he was elected president. Austin E. Wing, of the Peoples State Bank, followed Hayes as secretary for two terms, giving way to Julius H. Haas, of the Wayne County & Home Savings Bank, who was succeeded by Col. Fred Farnsworth, who continued until 1907, when he was elected secretary of the American Bankers Association. L. H. Smith served for one year following and in 1909 Mrs. H. M. Brown, the present secretary, who had been assistant secretary for two years previous, was elected. Among those who have served as president are the following: M. W. O'Brien, Detroit; H. C. Potter, Saginaw; Peter White, Marquette; George H. Russel, Detroit; George R. Angell; H. C. Potter, Jr., Detroit; H. G. Hamm, Port Huron; S. O. Fisher, Bay City; S. M. McCutcheon, Ypsilanti; Charles J. Monroe, South Haven, and George E. Lawson, Detroit, all of whom are dead. Other leading bankers who have served the Association as president are Louis H. Withey, Clay H. Hollister and Dudley E. Waters, Grand Rapids; George S. Morely and Otto Schupp, Saginaw; James H. Seager, Lansing; L. G. Kaufmann, Marquette, now of New York city; Leon F. Chichester, Petoskey; William Livingstone, Detroit; Emory W. Clark, Detroit; B. F. Davis, Lansing; C. H. Bender, Grand Rapids; Arthur G. Bishop, Flint; William J. Gray, Detroit; Frank W. Blair, Detroit; Gerritt J. Deikema, Holland, and John W. Staley, the present incumbent of the office.

What Changes, If Any, Should Be Made in the Federal Reserve System?

By PHIL S. HANNA

WHAT CHANGES, if any, should be made in the Federal Reserve system? There is little occasion for this question. If you took half a day off to interview the bank presidents in Detroit it is doubtful whether any of them would have any material changes to suggest. In fact, one bank president to whom this question was addressed promptly replied: "Be sure to underscore the words 'if any' when you write the article." Yet political strategists have asked the question and the answer is written more to impress on our readers that it is the almost unanimous opinion among financial authorities that the Federal Reserve legislation was perhaps the most effective piece of lawmaking in the history of the country. In practical operation the results achieved seem to have followed unswervingly the intent of the framers of the act, and this is something unusual.

It is unfortunate that the par collection matter had to be made an issue, for it clouded for a long time the bigger usefulness of the system in the eyes of many small banks. And much might be said here about pursuing less of the "forced feeding" methods in the par matter, but the country has been well served notwithstanding, and we have much to be thankful for.

A very fair-minded Republican, who is president of a large bank, expressed himself in this wise: "There is no question that the credit for forming the Federal Reserve Act is due the Republican party, but we must admit that the Democrats chose the psychological moment and 'put it over,' although I am sure that they did not comprehend when they did it how good the Act was." And he thinks further that much of the talk about amendments is due to the belief of political manipulators that some effort toward amendment must be made lest a Democratic measure be given too much credit.

Frankly, we are of the opinion that the war practically eliminated all political bias when it came to matters concerning the Federal Reserve system. The war was a common enemy which made legislators and party managers realize the peril in taking any chances by "tinkering" with the banking machinery. And it will mark a new era

The Special Securities Department of The Continental and Commercial Banks of Chicago executes orders for sales and purchases of securities (on behalf of customers and correspondents) on all exchanges. A minimum commission on these transactions is charged by intermediaries. We make no charge for the service we render.

Securities are exchanged from temporary form into permanent form at a cost covering only transportation expenses.

Payment is made to brokers and bond houses for securities purchased direct by our customers and these securities handled in accordance with their wishes.

The department also handles on an actual cost basis the registration, transfer and conversion of Liberty issues.

You are cordially invited to utilize this department.

Complete Banking Service

Over $55,000,000 Invested Capital

in American government, now that the common enemy has disappeared for the time being, if the tinkerers will "let well enough alone."

As this is written there is a renewed effort to unbend the system in favor of the farmer, which effort is one of the first signs of "politics." Agricultural paper running six months has been eligible for rediscount for a long time, the farm loan banks have received government favor and the farmers are exempt from the anti-trust law. Any special unloosening of the credit strings in favor of a particular class of citizens is going to set a bad precedent which is sure to be followed by attempts by other classes for similar favors.

In its broad aspects the system has wrought changes in banking, proponents of which would have been summarily dismissed as foolish and impossible some years ago. Consider for a moment how easy it is now for a community down in Texas to obtain the surplus funds of New England, compared with accomplishing the same thing before we had the system. The Dallas Federal Reserve Bank borrows from the Boston and Cleveland Reserve Banks with less difficulty than one can purchase a railroad ticket in Detroit, and in less time. And when you look deeply into these transactions it really means that the surplus money of the bank depositors in New England is being lent to the farmer borrowers in Texas. Without the Federal Reserve machinery at work, this transfer of surplus funds of one community to another distant community in need of funds would be difficult of accomplishment. In fact it might be difficult to convince some of the staid Bostonese that their money would be safe in Texas.

Without doubt the currency-issuing machinery of the Reserve Banks is one of the greatest inventions of the age. It does not take a great imagination to picture what might have happened in this country during the war if there had been only the old government bond currency, with its limited flexibility, available. The gold settlement fund in Washington and the telegraphic system of transferring balances are refinements in the machinery which are most serviceable additions to our financial equipment.

And there is another service which is of no inconsiderable value —the weekly reports of condition of some 820 member banks in leading cities. We get the condition of individual banks with each bank call but there is no uniformity in reporting, so that all the banks report at the same date. In some states the state authorities wait until the Comptroller of the Currency calls for national bank statements before sending out the state call but this is not true in all states. And furthermore the comptroller's calls do not come with sufficient regularity to permit of very intelligent analysis or to allow of comptiers' showing the trend of the banks' affairs. Thus the weekly reports fill this long-felt want very nicely.

But in spite of all the many features which merit approval there is at least one activity in our opinion which could just as well be omitted. We have in mind the strictly collection business, as distinct from par matter, such as collecting bill of lading drafts, notes, acceptances, etc. It is stated that only a few of the business houses throughout the country make much use of the collection service of the Federal Reserve system and in Detroit it seems that only a few of the banks send their outgoing collection items through the Reserve Banks; but nevertheless there is a pretty well defined belief in the country that the Reserve Banks are in the collection business to force par remittance the same as for cash items. There is a recent incident in which a Federal Reserve branch sent a collection item to a non-member bank and the latter remitted at par, unaware that it was permitted to make a reasonable charge for collecting the item; but the collecting bank wrote back a sarcastic letter berating the Federal Reserve branch for not sending postage to cover returns for gratuitous services. This incident gives some idea of the conception which some of the country banks have of the Federal Reserve Banks' collection business.

On the other hand, as regards incoming collections, there is an instance in Detroit where before the Federal Reserve went into the collection business, a local bank received an average of fifty collections a day from a large eastern house selling a well-known article to the grocery trade. But since the establishment of the Federal Reserve collection system this local bank has received none of these collections, has lost an average of $12.50 a day in fees and has been put to the further trouble of certifying about an equal number of its customers' checks, for which it cannot collect any fee.

Why not leave this matter to the free play of competition between the banks? Collecting notes, drafts, etc., is one of the old functions of a commercial banks and it seems entirely wrong for the Federal Reserve to invade this field either tacitly or aggressively. Keep up the wire transfer privilege and retain the system of providing a way for a manufacturer in, for instance, Portland, Me., to receive returns on an item sent to Houston, Tex., the day the item is collected, but

Digitized by Google

let the manufacturer in Portland select his own collecting agent in Houston, which will of course be a member bank. Under this arrangement a member bank in Houston has a distinct advantage over a non-member bank, for it can offer telegraphic remittance of proceeds of collections.

And from the standpoint of making membership attractive to non-member banks, why not eliminate the collection business?

The criticism has been made that the Federal Reserve Board has been too rigid in its construction of the law and the application of its rulings. There may be something in this. John Skelton Williams says so. But a lot of unnecessary rigidity will wear off as contact becomes closer between the member bankers and the officials of the system. The division of part of Michigan into a branch district at Detroit was a step in the right direction. Country bankers who naturally make Detroit headquarters are much closer to the branch officials than they would ever become if all the officials were in Chicago, and conversely the Detroit officials get a closer view of the credit situation than would be possible under the larger unit of territory.

It has been proposed in Washington that the duties of the Comptroller's department be transferred to the Federal Reserve Banks; and there is much of merit in this proposition. At present the Comptroller's office attends to the examining of the national banks and the different state supervisory authorities look after examining the state banks which are members of the system. The Federal Reserve Banks have the right to make examinations by their own men, but if they do so the banks are subjected to double supervision. The point is advanced by proponents of the change that the authority which grants the credit should do the examining, and this is correct. By transferring the examination of national banks to the Federal Reserve Banks (his object is partly accomplished, and then some day (nothing guaranteed) the states will get together and turn over the examination of state member banks to the Reserve Banks. There would be economy in such a change and in part a removal of the bank examiner from political influence, although fortunately there has been little of politics in the appointment of national bank examiners the last decade. It was not so, some years ago.

But, after all, would not the whole country be better off if Congress went slower on amendments? Wouldn't it be better to continue the Reserve system as it stands for a while and let time and experience dictate changes more pronouncedly. It seems as if Congress is like an old woman trying to keep chickens out of her garden around which has been built a conglomeration of fences. When the chickens break through one hole she rushes over and hurriedly repairs the hole with a makeshift, and while she is doing that job another old makeshift repair job breaks down. The Federal Reserve Act has a very substantial legal wall built around it and it is serving its purpose admirably in the main; so why begin patchwork?

The Reminiscences Of a Bank Examiner

By JOHN WELTON SKILLIAMS, JR.

ACCORDING to some bankers the bank examiner is sort of a necessary evil. He comes usually just when he isn't wanted, keeps things all stirred up—often "balled up"—and the banker has to pay for the operation.

Some examiners use the direct method of stating their criticisms while on the job but others cling to the system of simply making observations which they include in their report and leave it to "the office" to do the criticising by mail. The latter method works out all right the first time around but on a return visit an examiner is apt to run into a situation like the following: Down in a town in southern Michigan there was a banker who had been in the business many years; he had lent money in the early days when banks were not so careful about air-tight security and he had also lent money freely as a private banker. So when his bank was incorporated and it was necessary for him to entertain the bank examiner he had to learn some things all over again. It wasn't easy for him to bear criticisms gracefully and the boys soon found that it was much better to "let the office apply the raspberry."

One morning two of us met the old gentleman at the station. He was leaving town by the train on which we arrived, so on seeing us he stopped to extend his usual cordial greeting. He said: "Boys, I'm powerful glad to see you. We have such nice visits when you are making the examination, everything does along so smoothly that I get to thinking I am all right; and then after you go those awful letters from Lansing come down and spoil it all."

The examiner's lot is not an easy one. There is more hard work

MICHIGAN BANKERS— WELCOME TO DETROIT

The officers and staff of the Detroit Trust Company take pleasure in welcoming Michigan Bankers to Detroit, and assure them of an earnest desire to make their stay in this city as pleasant and profitable as possible.

From our quarters, opposite the Post Office at the Southwest corner of Fort and Shelby Streets, we shall be glad to extend to them every courtesy and facility at our command, and hope that they will feel free to make this institution their headquarters while in town.

crammed into a week's assignment than most men in similar work would try in a month, yet there is a fascination about it that keeps a man going. Occasionally we were sent out alone for a week, with instructions to examine three or four small banks. This was not so attractive, because it meant traveling around alone. But speaking of the amount of work performed by examiners as compared with other auditors, there is a good sized bank up-state which normally carried about $300,000 in cash in vault, and the tellers' cages were so arranged that it was hard to get the money counted accurately before the bank opened. Usually we got started on the count about 8:30 and it was exceptional when the job was not finished by 9:30, with four or five men doing the work. The scheme usually followed was to count out enough currency and silver for the paying teller to start the day with and hand it to him, then take charge of the remainder of the money and turn it over to the other tellers when final proof had been made. The money in the vault was sealed up and counted after the desk money had been counted. It must be remembered that the operation included counting many "cash items" and making allowance for deposits and checks taken in the night before after close of business the previous day.

A short time after one of the regular state examinations this bank employed a firm of auditors to make an examination and it took these gentlemen from 8:30 a. m. until 6:30 at night to finish counting the cash, with nine men working on the count instead of four or five, the number usually used by the examiners. Of course a public accountant goes into much more detail than a state examiner; he is looking for variations as low as one cent, while the examiner is not concerned with such small differences. The latter's job is well performed if he finds there are no intentional errors in the cash account and no actual errors of any magnitude, although if the same condition is noted time after time he will begin to give that department more searching attention.

It is strange how one soon learns to recognize the difference between actual error and intended error. There are many tellers who are just naturally "sloppy" in handling their work. Their desks will look like the bottom of a chicken coop in molting season, yet the honest teller has a rule-of-thumb procedure by which he keeps himself above suspicion, for he does not make the errors which look suspicious and in the long run the total of his shortages will be almost covered by his recoveries. The writer was checking up a teller once and found him $4,500 short. The man calmly admitted it and offered no explanation. His desk looked like the waste paper basket had been dumped on it. He was a typical "sloppy" teller. After a couple of hours we thought he would show some signs of nervousness but he just kept on checking back over the previous day's work and said little except that this affair would rob him of going fishing that evening. At lunch time we mentioned something about a certain town's poor baseball team and our friend the teller hurried out of the bank without making any comment. My assistant remarked, "He is either a crook or a nut," and for a time we thought so, for he did not return promptly at 1 o'clock. But about 1:30 in he came with a depositor's pass book which had several checks inside wrapped around with a rubber band, which checks exactly totaled his shortage. He didn't go into any lengthy explanation but said simply that the depositor had come in just at closing time the night before with the deposit slip in one hand and the deposit book and checks in the other, and both being ardent baseball fans it happened in the argument which followed that the deposit slip got on to the spindle and the customer got away with the checks as well as his deposit book.

Now this was an unintentional error, and while this teller probably is still making many similar ones, there is something about the way his errors happen that allays suspicion and he is highly respected and is without doubt a scrupulously honest man. But it is a strange axiom of the examining business that crookedness most frequently is found with sloppiness. There is an opposite case which comes to mind of a banker whose cash always balanced right to the cent and yet his ledgers were never in balance. For several years the boys had spoken of this and still no one could figure out an explanation. The bank was a very small one and the town on a branch line road which had a train in in the morning about time to open the bank and out again about dinner time. There was just enough time to do the job between trains. One day one of the boys suggested driving to this village and starting the examination at closing time, which we did, and great was the cashier's surprise to see us come. He was just in the act of balancing up his cash for the day and remonstrated with us for bothering him, but after a little diplomacy we got started and discovered first thing the secret which our friend had covered up so long. We found at the end of the day's business he would simply enter up the various totals of debits and credits directly into the general ledger and then add up both sides, deducting one total from

Digitized by Google

the other and calling the remainder "cash." He would then count the actual cash and if it was greater than the cash figured on the general ledger he would put the difference into a certain safe deposit box, but if actual cash were smaller he would take the difference out of the safe deposit box.

This man, too, was scrupulously honest, and he expressed great surprise at our objection to his "system", but while it might never have led to trouble in his case, some day his employes would be sure to emulate him for other purposes. It was only after a trip of the board of directors to Lansing that he agreed to give up the practice.

The question often is asked: "What is to prevent a crook from representing himself as a bank examiner and thus gaining access to the bank's money and securities?" Fact is that there is nothing to prevent his trying it but he wouldn't get very far, for even theft of an examiner's certificate of office wouldn't help him much if he didn't know the men on the force. About the first question a banker asks, when a strange examiner presents himself, is about the last examiner who visited him. Or he may ask about some development at the office in Lansing, and there are very few crooks who could post themselves fully enough to withstand such questioning without alarming the banker by unfamiliarity with the personnel of the department. But there was a man up in Gratiot county who knew how to make an examiner identify himself. He didn't believe in taking any chances, and even though a man had been there before he went through the same formality of looking over credentials carefully before he opened the iron gate. On my second trip I had come away from home without my certificate of appointment and it was only by the pleadings of the assistant cashier that I got in, for the latter remembered the first visit. But the funny part about the old man was his remark that he didn't care if I had examined his bank before and he explained with the further remark: "How do I know you haven't quit your job with the state and are not out using this as a bluff to get your fingers on my money?"

As I look back there is one incident which always stands out as particularly amusing, although the man who was inconvenienced thereby did not think so at the time. Down in the Holland and Zeeland district in Michigan the Dutch are wonderful savers. I do not believe there is a single man, woman or child above the age of four or five who has not from one to ten certificates of deposit in the banks. It doesn't seem to make any difference how small the amount is, it goes immediately into the bank, and custom has built up the plan of issuing certificates of deposit for each deposit, rather than issue savings pass books. The Hollanders like the certificates, presumably because they look like and can be used like money and because they draw interest; two features of investment which we are all striving for.

In the banks they keep in a register a record of each certificate, devoting a line to each one issued. When the certificate is paid and cancelled the date when paid is stamped in a column for that purpose on the register, so that by adding up the amounts against which no paid date has been stamped, the examiner obtains a trial balance of the certificate account. And of course the reader will readily realize that in a place like Zeeland the number of outstanding certificates runs up into the thousands. So an examiner when he starts to add up 5,000 or 6,000 different amounts appearing hop, skip and jump throughout five or six books, must have much patience and know that his adding machine is working properly and that there is plenty of paper supply.

Now it does not often happen that the total as found by the examiner balances exactly with the general ledger control, and in cases where there is a difference it is necessary to check back the items appearing on the adding machine tape with the items as they appear on the books.

One day a green examiner started running up the certificates of deposit in a large bank. He labored patiently for over two hours and finally came to the last book and then the last item, but when he had pulled the lever the last time and had taken off his total he found a big difference which must be checked back. Great was his dismay, therefore, to find that someone had placed a shiny, brass spittoon right behind the adding machine and that all the time he worked he had been feeding the tape right into the spittoon. Needless to say that it was necessary to do the work over again.

Contrary to the opinion many persons hold, the examiner is not a detective. It is true that he is supposed to detect dishonesty, but his duties have been so multiplied of late years that catching crooks is only part of the job. His chief function, according to general understanding nowdays of those in the calling, is to determine solvency. That is paramount. Banks have not only grown in size but have added many new activities, such as trust departments and foreign exchange departments, each a highly technical business in itself.

From the President's Desk—Talk No. 51

The Men Who Are "Making Good" Today

are those men who are working the hardest. They're not waiting for business to "pick-up"—they're helping to pick it up.

I know a salesman—a depositor of this bank. I stopped him the other day to ask him how he found things. "Fine," said he—then, as an after-thought, he explained—"I'm making money, but I'm working five times harder than I did last year for it."

That's the solution of the business problem of today. Last year business was coming to you—this year you must go after it. You'll find it if you go after it hard enough. Soon, you'll find you have no time for worry. Try it.

Foreign Trade and Prosperity

The Relation of Edge Law Corporation Activities To the Future Well Being of Business in America

By EDMUND D. FISHER

THE READER who is familiar with the novels of Sir Walter Scott knows that this distinguished author had a broad knowledge of the social and economic conditions of the period in which his story was placed. In Rob Roy, for example, the hero in approaching Glasgow spoke of the place as a growing center and stated: "An extensive and increasing trade with the West Indies and American colonies has, if I am rightly informed, laid the foundation of wealth and prosperity, which, if carefully strengthened and built upon, may one day support an immense fabric (of trade)."

Foreign trade, then, is presumed to be the basis of wealth and prosperity. The experience of the city of Glasgow, as well as that of most of the cities of Great Britain, proves this statement to be true. English experience in commerce dates back several centuries. Most of the larger enterprises of exploration, settlement and trade in the New World were supported by the merchants of England and Scotland, who, with far-sighted vision, realized the wealth that would come from both trade and investments beyond the seas. Sir Walter used two words that have a special significance at the present time if considered in relation to our own export problems—"carefully strengthened." The world demand for American goods during the war period developed a "seller's market." Price, packing, terms of payment and in a measure quality of goods, became secondary considerations. Now conditions have changed. World competition is being gradually re-established and we must begin to "carefully strengthen" our position by studying the requirements of importing countries and developing trade through the extensions of reasonable, long-time credits.

The United States has now reached a point in her economic development when the increase, or at least the maintenance of her export trade, is necessary. Imports have been materially reduced. War conditions both speeded up her ability to manufacture for export and to be in a measure independent of imported goods. The volume of business thus created gave full employment, good wages to labor and made for general prosperity except to the extent that exports were destroyed in the flames of war, diverting effort to non-productive enterprise. Now, however, the reverse tendency has set in. Demand for our surplus goods has fallen off. Prices have declined and unemployment has been severe.

It must be evident that if we could quickly develop a demand for our surplus, even if not immediately paid for in cash or in offsetting imports, unemployment would disappear, prices would be stabilized and normal conditions again prevail. There is also, in part, the problem of domestic interrelation and organization.

War has taught us that world adversity must ultimately affect each individual nation. A recent report on the economic situation in Paraguay states: "As a result of the high prices paid during the war for cattle, hides and tobacco, this country lived through a period of the most flourishing prosperity. In the early part of 1920 the meat packing plants here suspended operations and the interest in cattle lessened, until now, when cattle cannot even be sold at the lowest price. * * * thousands of hides and tons of tobacco are stored in warehouses in Buenos Aires and in European ports that cannot be sold." Yet the European and Eastern world is underfed, under-clothed and in sore need of the surplus of both the Americas.

We must help to restore world prosperity in order to have both present and future domestic prosperity. Under present conditions we desire a maximum export trade and a minimum import trade. We cannot expect and do not desire gold in payment for the difference. There is thus no other way to help both the world and ourselves but to import securities to balance the account. Specifically, we must grant long-time credits. A balanced trade, imports practically equaling exports, is, of course, the ultimate ideal. Each nation would then produce and export that for which it has a special aptitude. This, however, will take years of readjustment and the use of much new capital to restore the basis of industry in many nations. Much of the commercial, industrial and farming activity in our country depends on the ability to export. A large industry in one of our important cities has a normal export trade of 30 per cent. Full activity in this industry means a normal spending power, normal business in many lines—in general, it means prosperity. What is true in the center to which reference has been made is equally true to a lesser or greater degree in all sections of the United States.

The farmers, holding a large surplus of cattle, grain and cotton, need cash to plant new crops and to pay bank loans. Investors from month to month need new securities. There is a foreign demand if short time credits can be granted for consumable goods and long time credits for machinery and supplies for productive enterprise. This present fixed triangle of relation must be rounded into a circle and made to revolve.

Business of the nature outlined is, of course, always moving in more or less volume. The trouble is that it is not now moving in sufficient volume and needs stimulation and guidance so far as foreign trade is concerned. Movement needs freight cars but rates are too high. Movement needs ships but many are tied up at the docks. Movement needs men and many are idle. Movement needs credit and finance is the rub." This dislocation of domestic transportation, labor and financial relations is quite evident to the business man. He does not, however, fully realize the international relation and its effect upon his individual problem. Just as there is a connection between the trade of cities and states, so there is a connection between the trade of nations. The influence of the latter is somewhat confused at times by tariffs, by distance and by transactions through agents and intermediaries; but it is an influence that bears a direct relation to the volume of such trade. Prosperity is thus inevitably linked both to domestic trade and foreign commerce. A falling off in export trade immediately curtails the output of the manufacturer, reduces the sales of the farmer and has a similar influence on all lines of business.

Now we have the goods or are able to make the goods to satisfy a large foreign demand. We see that the manufacture and movement of goods bring normal trade relations. We know that the dollar and credit are very potent as directing forces. We have seen how they were used by the Government during the war and their effect on industry and export trade. We know, however, that the export trade thus developed was partly on an unsound basis and was largely our contribution to a world loss. Yet we had what we called prosperity. We were busy.

During the war the basic problem was credit. Now during the period of readjustment credit must become the factor to bring back prosperity. But it must be a new type of credit and one whose use

E. D. FISHER

EDMUND D. FISHER needs little introduction to readers of this paper, having been often a contributor of articles on banking and foreign trade. He has a long list of achievements to his credit, the most outstanding of which, perhaps, is the service he rendered to the monetary commission by his testimony when the Federal Reserve Act was in process of formation. He is now in Washington conducting investigations for the Chamber of Commerce of the United States into the proposed metric system and is acting as chairman of the metric committee of that body. Until recently Mr. Fisher was vice-president and manager of the Bank of Detroit, and he continues to make this city his home—The Editor.

will be of more economic value to the country than the use of Liberty bonds.

In order to sell our surplus and promote our export trade it will be necessary either to lend to the exporter until he can be paid in the normal course of business or lend to the buyer, who may be able to give good security but who is unable to pay in cash. The latter type of loan is quite likely to take the form of serial bonds which will be paid from year to year from the earning power of the enterprise involved or from the revenues of the city or state to which such loan might be made. Loans may not always be made to finance the direct purchase of goods but under the stipulation that the money be expended in the United States. Thus funds advanced will not leave the country, although a corresponding amount of goods would ultimately be exported. The tendency of all such loans would be to stabilize prices, promote business activity and develop a savings fund in the form of securities for the future. When the war broke out England had foreign investments amounting to $21,000,000,000. This great savings fund proved her salvation. The investors of the United States had foreign investments at that time of but $500,000,000 and we were a debtor nation. Although we are now a creditor nation the debt owing us is largely based upon advances for war purposes which have no quality of self liquidation. We need a new type of foreign investment based upon loans granted to develop real productive enterprise with the inherent ability of earning enough easily to pay interest and the proportional parts of the debt as they fall due.

It is not the habit of banks to grant the type of long-time credit necessary to promote our export trade and to meet the requirements of importing countries under present conditions. For this reason a measure known as the Edge Bill was passed by Congress as an amendment to the Federal Reserve Act, providing for the incorporation of finance companies authorized to raise capital for the purpose of buying foreign securities and issuing debentures to the investing public. As the business of such corporations will be under the supervision and regulation of the Federal Reserve Board, the character of the investment made will be unquestioned. The most important corporation organized under this Act is known as the Foreign Trade Financing Corporation. Its authorized capital is $100,000,000 and it may issue debentures to the extent of $1,000,000,000. Its activities in connection with similar organizations will have an important bearing on the future development of our export trade not alone from the volume of its business but also from its power to standardize general practice in relation to foreign investments and to educate the investing public on the value of such investments in promoting domestic prosperity through foreign trade.

Bank Costs Today

THE QUESTION sometimes is asked but not often clearly explained why banks are still able to do business and make profits with expenses so much greater than they were some years ago. Putting the question the other way around, why is it that the banks which have been collecting only 15 per cent more interest on loans these last two or three years, have been able to pay the costs of running a bank, which are twice as great as formerly? Every banker knows the answer. He knows that it has been a problem to pay double wages and double costs for everything that goes into a bank, and he knows that the only thing that has saved him is the has been the unprecedented volume of business. It is true that profits have been large of late. 1919 and 1920 were banner years for national banks, according to the Comptroller of the Currency, but the story will not be completely told until we learn about 1921 and 1922, for it is one thing to make big profits on increasing deposits and decidedly another job to keep up the same rate of profit on declining deposits.

In Detroit, for example, the clearing house banks have about $50,000,000 less invested in earning assets now than they had at the high peak of 1920. It is true that the interest bill for deposits is less but nowhere near the same decline. On April 2, 1920, total savings deposits were $209,800,000, which were all drawing interest. Commercial deposits were $243,700,000, the great bulk of which was not drawing interest, but by May 5, 1921, the tables had turned face about and the banks had lost the use of about $62,000,000 commercial deposits and were paying interest on $194,000,000 savings deposits—a drop in the latter of about $15,000,000; so that the free capital so to speak, went off against capital on which interest is paid in the ratio of 62 to 15. And practically the entire income was lost on an amount of pledged assets equal to the amount of borrowed money obligations. So the upshot of it all is that the banks are carrying a relative higher expense load than they did when commercial deposits were higher than savings deposits and when borrowed money obligations were at a minimum.

The "Why" of the A.I.B.

What a Few Years' Experience With This School For Coming Executives Has Taught the Doubters

By R. B. LOCKE

Manager and Director, Detroit Branch, Federal Reserve Bank

AS LONG AGO AS 1909 the foremost bankers of the country realized that if the maximum of efficiency were to be reached in the matter of service performed by bank clerks, some method must be sought through which bank clerks could learn more of their chosen line of work than through the experience of their daily routine. It was also realized that the officers of the banks must for the most part be chosen from their own employes, which only emphasized the need of some method of systematic education for these men who were destined to be the bank executives of the future.

The result was that at the annual meeting of the American Bankers Association held at Richmond, Va., in the fall of 1900 the committee on education reported its belief that the formation of a chain of bank clerk associations throughout the country was perfectly feasible, and that, conducted on proper lines, it would do a vast amount of good. The report of the committee was received with cordial approval and a resolution was adopted appropriating the necessary funds for organization and preliminary work.

These are the reasons and the circumstances attending the birth of the American Institute of Banking, an organization which today numbers more than 42,000 members in all the larger cities of the United States. In its membership are found bank employes ranging in rank from messenger boy to president, the one realizing the need of education if he will succeed and the other determined to lend his support to the organization which is doing more than any other agency to increase the efficiency of his organization and which is developing men within his organization who are fitted to assume the responsibilities of executive positions.

For twenty years the American Institute of Banking has been turning out men who have given concrete evidence of their realization of the seriousness with which they regard their employment. These men realize that while experience is necessary to continued advancement, the very nature of the banking profession calls for more than experience. It calls for a knowledge of economics, banking and commercial law, accounting and many other subjects, necessary because the banking profession necessitates a knowledge to some extent of every business with which the bank comes in contact—which means all business.

It is therefore true that today and in the future bank executives are being chosen very largely from the ranks of the American Institute of Banking, not because they are members of the Institute but because the men with the ability and seriousness of purpose naturally find their way into the Institute.

At the time the Institute was organized there were many skeptics. These men threw up their hands in horror and predicted that there was being organized the nucleus of the most powerful union history had ever known. They predicted that the bankers in sanctioning the organization of the Institute were inviting strikes for higher salaries and were in fact virtually committing suicide. But those who have had in charge the administration of the affairs of the Institute have never lost sight of the fact that the primary principle of the American Institute of Banking is education and the resolution adopted at the annual convention of the Institute at New Orleans in 1919 is really the creed of the Institute. The Institute is proud of it and the bankers are proud of it. It reads as follows:

"Ours is an educational association organized for the benefit of the banking fraternity of the country and within our membership may be found on an equal basis both employes and employers, and in full appreciation of the opportunities which our country and its establishments afford, and especially in appreciation of the fact that the profession of banking affords to its diligent and loyal members especial opportunities for promotion to official and managerial positions, and as a result of the establishment and maintenance of the merit system in most banks a large number of Institute members have through individual application achieved marked professional success; we at all times and under all circumstances stand for the merit system and for the paying of salaries according to the value of the service rendered.

"We believe in the equitable co-operation of employes and employers and are opposed to all attempts to limit individual initiative and curtail production, and, insofar as our profession is concerned, are unalterably opposed to any plan purporting to promote the material welfare of our members, individually or collectively, on any other basis than that of efficiency, loyalty and unadulterated Americanism."

Even with this splendid record of loyalty and achievement it is a regrettable fact that there are still some banks whose executives are opposed to the Institute, for reasons better known to themselves than to anyone else. Within the last year there was attempted the organization of a bank clerks' union in one of our larger cities. The union representatives had planned the matter carefully and felt that the time was ripe when the cost of living was at its highest, to organize the bank clerks. When the smoke cleared away and a count of members of the proposed union was taken it was found that they had fifty-five members and all but sixteen—which included all the officers of the proposed union—were men employed in a bank which was opposed to the Institute.

Some bankers have felt that too much education was detrimental to the interests of the banks inasmuch as the number of executive positions and higher salaried positions was limited. It is true that every member of the Institute cannot hope to become a bank executive, that some are destined to always be a bookkeeper, but it is also true that any man with ambition and ability and knowledge who for any reason sees his future in the banking profession limited will seek other fields of endeavor. There are many men who have been Institute members and who have completed its educational work who now hold responsible positions in other lines of business and because of this fact the benefits of the American Institute of Banking are not limited to the banks. Our whole business fabric shares in the benefits.

R. B. LOCKE

ROBERT B. LOCKE is well qualified to write about the laurels won by the American Institute of Banking. He was president of the Boston chapter of the Institute before coming to Detroit and was president of the Detroit chapter until the May 21 election, at which time he declined to be again a candidate. The local chapter has gone on record supporting Mr. Locke for president of the national organization, of which he is now vice-president, the election to take place in July at the annual convention at Minneapolis.

Before coming to Detroit Mr. Locke was for several years manager of the credit department of the Old Colony Trust Company. In 1916 he was brought here as manager of the Detroit Clearing House, and in 1918 became manager of the Detroit branch of the Federal Reserve Bank. He has since been elected a director of the branch.—The Editor.

President Beckley, of the Institute, hit the nail on the head when he said at the recent meeting of the Executive Council of the American Bankers Association. "While it may be true that bankers are born and not made, it is also true that they are not being born fast enough; and it is therefore necessary to find some substitute. The American Institute of Banking is that substitute."

Frank A. Vanderlip has referred to this country as a nation of economic illiterates. In the Detroit Chapter of the Institute this year, David Friday, the eminent economist of the University of Michigan, conducted our class in economics. His course consisted of a series

Digitized by Google

of twenty lectures of two hour each, supplemented by assigned reading. These lectures were held in the evening and the attendance averaged about 200 young bank men. What better proof of the work the Institute is doing can be asked than this? Classes also were held in elementary banking for the younger boys, a class for the men employed by trust companies and two classes in public speaking. In the class in economics 79 of the students took the final examination and 71 of them passed Prof. Friday's standard. The examination questions give some idea of the scope of his course and are printed at the conclusion of this article. How many bankers are there who feel that they could successfully pass this examination and how many are there who are not proud of the fact that there are some of the 71 connected with their institution?

Next year the Detroit Chapter will have a much more comprehensive educational program and negotiations are under way with the University of Michigan which we hope will result in close co-operation with the University, to the end that our educational work may be of the highest possible standard.

Detroit is the only city in Michigan which has an organized chapter of the Institute. There are undoubtedly other cities which should organize chapters; but the benefits of the Institute are available to all banks whether they are located in chapter cities or not. The Institute for the benefit of students living outside chapter cities maintains a correspondence chapter. The correspondence chapter has more than 5,000 students. As implied, these students conduct their studies by correspondence, the work being directed from the headquarters of the Institute in New York. The work is comprehensive and is continually revised by eminent educators in order that the highest standard may be maintained. Where there are a number of correspondence students living in the same locality, it is customary for them to meet at stated intervals and discuss the problems in connection with their educational work.

No history of the Institute is complete without some words about George E. Allen, or "Uncle George," as he is affectionately called by all who know him. "Uncle George" has been our educational director ever since the birth of the Institute, and his has been, more than that of any other man, the dominant personality that from the beginning has carried the Institute safely through all its periods both perilous and promising. The American Institute of Banking, while being a monument to the foresight of certain leaders in the American Bankers Association, and a credit to those young men who have benefited by it and helped in its management, is a vigorous adult now, mostly by reason of the faith "Uncle George" has always had in the young American banker.

EXAMINATION QUESTIONS

Detroit Chapter A. I. B., 1921

1. How do you explain the fact that the rate of interest rose rapidly from 1902 to 1912?

2. Do you believe the rate of interest will rise or fall in the next two years? Why?

3. What would be the effect of an increase in demand upon the price of the following articles: (a) copper? (b) land? (c) automobiles? (d) wooden chairs?

4. How would you levy a tax upon a monopoly? Why?

5. "The imposition of a protective tariff against European goods is an obstacle to the repayment by Europe of the principal and interest of her debts to us." Explain this statement.

6. The country bank in Rockford, Ill., is refused further loans and rediscounts by the Federal Reserve Bank of Chicago. It carries a balance of $150,000 with a New York bank, and has $100,000 loaned out at call on the N. Y. money market. To what extent can this bank expand its loans in spite of the refusal of the Federal Reserve Bank to extend it additional facilities?

7. "In spite of the constant assumption of liquidity in banking assets by banking writers, the fact is that the bank credit of the country as a whole is liquid only within very narrow limits." Explain.

8. "As long as the stock exchange call loans retain their prominence as secondary reserves of too many banks, . . . we shall not enjoy a complete and perfect banking system." Explain what the writer means by referring to call loans as secondary reserves.

9. "The bank statement was criticised because of the enormous increase of $44,000,000 in loans. As deposits increased $33,000,000 the banks were certainly entitled to place 80 per cent of this increase among the borrowers if the demand existed." Point out a common error implied in the second statement.

11. The statistics below are for a group of national country banks and a group of national city banks. (a) Judging from the nature of their assets which would you say were the country group, and why? (b) Explain the difference in the size of the resources of the two groups by reference to the differences in their liabilities.

Trust Powers For State and National Banks

Some Policy Considerations to Which Legislation Proposed This Year in Michigan Has Given Rise

By RALPH STONE

THE WRITER accepts with pleasure the invitation of Ye Editor to discuss the legislation enacted at the recent session of the legislature of Michigan granting trust company powers to state banks and, likewise, the provisions of the Federal Reserve Act granting similar powers to national banks.

As the laws of Michigan and the United States now stand, power to act in trust capacities is granted to trust companies, state banks and national banks. It will be instructive as well as interesting to note in what respects these several laws differ, not only as to powers which are granted but as to the limitations placed thereon and the responsibilities and liabilities assumed thereunder. Naturally, more extensive trust powers are granted to trust companies, under the Trust Company Act of Michigan, than are granted to banks under their enabling acts. Trust companies are empowered to transact practically every kind of trust and fiduciary business but on the other hand, they are placed under stricter requirements than seems to be the case with either state banks, under the law enacted by the recent legislature, or national banks under the terms of the Federal Reserve Act and the regulations of the Federal Reserve Board issued in compliance therewith.

The Trust Company Law was enacted in 1889 and it has served its purpose unusually well without amendment since its enactment. The minimum capital of a trust company in Michigan is $150,000, and graded according to population to a maximum of $5,000,000. Not less than 50 per cent of its capital, nor more than $200,000 in specified securities must be deposited with the state treasurer as security for the depositors and creditors of the company. The trust company cannot issue bills to circulate as money, buy or sell bank exchange or do a general banking business. It is obliged to keep on hand funds in an amount equal to at least 20 per cent of its matured obligations, three-fourths of which may be kept in any bank or trust company approved by the banking commissioner.

The state bank, under the Act passed by the recent Legislature, may, when authorized to do so by the state banking commissioner, act only as executor and administrator of estates of deceased persons and guardian of estates of minors. Unlike the Trust Company Law there is no requirement or limitation as to its capital, although the banking commissioner may take into consideration whether the capital and surplus of the bank is sufficient in the circumstances of each case. The state bank of course is entitled to do a banking business as well, whereas the trust company is prohibited from so doing. The state bank is required by the new law to segregate its trust assets from the general assets of the bank and keep a separate set of books and records of the trust business. The state bank is not required to deposit securities with the state treasurer as security for the trust depositors and creditors, as is the case with the trust company.

The Federal Reserve Act as amended on September 26, 1918, gives the Federal Reserve Board authority to grant special permits to national banks to act as trustee, executor, administrator, registrar of stocks and bonds, guardian of estates, assignee, receiver, committee of estates of lunatics, or in any other fiduciary capacity in which state banks or trust companies are permitted to act under the laws of the state in which the national bank is located. It will thus be seen that the national bank has power to act in substantially all the trust or fiduciary capacities in which the trust company may act, provided the Federal Reserve Board deems it best to grant them. In some cases the national bank has asked for only a part of these powers, and the permits issued by the Federal Reserve Board place a corresponding limit upon the capacities in which it can act. It appears, therefore, that subject to this control of the Federal Reserve Board, the national bank in Michigan is in a position to act in a greater variety of trust capacities than the state bank.

Prior to the enactment of the Michigan law at the recent session of the legislature giving the state bank certain trust powers, the national bank by the terms of the Federal Reserve Act was required to have a capital and surplus not less than that required by state law for the trust companies and state banks, and it was likewise required to deposit securities with the state treasurer in the same amount as the trust company. There is also a provision of the Federal Reserve Act which authorizes the Federal Reserve Board to grant by permit to the national bank the right to act in any fiduciary capacity in which the state bank or the trust company may act, if they come into competition with the national bank. It is apparently the purpose of this provision to place the national bank, coming into competition with the state bank or the trust company in the same state, upon an equality in respect to trust capacities in which it may act, with the state bank and the trust company. Whether it is likewise the intent of the Act to place the national bank upon an equality with the state bank as to capitalization and deposit of securities with the state treasurer (that is, freeing it from any requirement with reference thereto except as some discretion is apparently granted to the state banking commissioner) depends upon the construction placed thereon by the Federal Reserve Board and, perhaps, by the courts. Is the national bank free from any requirements as to capitalization because the state bank is subject to none, other than the discretion lodged in the state banking commissioner; or is it subject to the minimum requirement of $150,000 and the maximum of $5,000,000 prescribed by the trust company act? Is the national bank required to deposit securities with the state treasurer because the trust company is so required; or is it free from that requirement because the state bank is not subjectedthereto? Likewise, to what extent is the national bank in Michigan freed from the other provisions, restrictions and limitations of the Federal Reserve Act and the regulations adopted by the Federal Reserve Board, if the state bank in Michigan is not subjected to similar provisions, restrictions and limitations? These are questions which the writer will not attempt to answer because he would be indulging in speculation as to decisions which may be made by the Federal Reserve Board and the courts.

It would have been better if the legislature had more closely harmonized the new state law with the Federal Reserve Act, because both national and state banks are owned by Michigan stockholders,

RALPH STONE

MR. STONE, in this article, writes from an experience of upwards of a quarter of a century—six years as trust officer of the Michigan Trust Company, Grand Rapids, and twenty years (the entire corporate existence) with the Detroit Trust Company, successively as assistant secretary, secretary, vice-president and president. Every phase of the trust company business, as it is operated in Michigan, has come under his observation and he is accordingly well qualified to speak with the authority of tested experience.

His discussion of the subject of this article is broad-gaged, impartial and considerate of the interests of the three forms of financial institutions—trust companies, national banks and state banks.—The Editor.

WHICH DO YOU NEED—

High Income or Appreciation in Capital?

If you must have high income—the highest income compatible with safety—you should invest in bonds of a conservative character paying from 7% to 8% and selling around par.

Many Corporations of the highest credit have of late been forced to issue securities paying these rates, owing to conditions prevailing in the money market.

If, on the other hand, you are more concerned with an ultimate increase in your capital, you should invest in conservative bonds paying from 4% to 6% and selling at a material discount.

There are available in these unusual times many bonds paying from 4% to 6% and selling anywhere from 10 to 30 points below their par value.

Bonds such as these have the double advantage of yielding a liberal current income and of offering every reasonable promise of a very considerable advance in price.

If you will let us know in which class you feel you must invest, we shall be glad to submit a special list of bonds to meet your requirements.

Permit us to point out that we have excellent investment facilities; consequently our service should be very helpful to you in making suitable selections.

1050 Penobscot Building, Detroit
Members New York Stock Exchange

located within Michigan and with Michigan depositors and clients, so that their interests are identical.

Other differences in the provisions and requirements of the Federal Reserve Act and the regulations of the Federal Reserve Board, on the one hand, and the new state law on the other hand, are as follows:

The national bank, the same as the state bank, is obliged to segregate assets held in a fiduciary capacity and keep a separate set of books and records, which are open to inspection by the banking commissioner. The national bank, under the regulations of the Federal Reserve Board, cannot carry in its trust departments current funds subject to check or receive deposits of checks, drafts, bills of exchange or other items for collection or exchange purposes. There is no such prohibition in the new state law relating to the state bank.

The national bank is required to set aside in the trust department United States bonds or other securities approved by the Federal Reserve Board for funds received in trust awaiting investment before it can use such funds in the conduct of its business; and if the bank fails, the owners of those funds have a lien on the bonds or other securities so set apart, in addition to their claim against the bank. There is no requirement of this kind in the new state law applying to the state bank. Inasmuch as the latter is not obliged to make a deposit with the state treasurer, there is therefore no specific fund or securities for the protection of its trust depositors and creditors, although it is probable that the capital, surplus and undivided profits of the bank would be liable for the claims of trust creditors.

The regulations of the Federal Reserve Board oblige the national bank to establish a separate trust department and place it under the management of officers whose duties shall be prescribed by the board of directors of the bank. There is no such requirement in the new state law applying to the state bank, except as it may possibly be implied in the direction that the trust assets shall be segregated and a separate set of books and records kept. The federal regulations also require that trust securities must be placed in the joint custody of two or more bonded officers, or other employees designated by the directors of the bank, but there is no provision of this kind in the state law for the state bank. The federal regulations also prescribe the manner in which trust funds of the national bank shall be invested and investment approved; but no requirements of this kind are made in the new state law for the state bank. The Federal Reserve Board reserves the right to revoke permits issued to a national bank to exercise trust powers, but the state banking commissioner under the new law is not expressly given that power, having once granted the permit.

The foregoing covers the main points of agreement and difference between the trust company act, the new state law and the Federal Reserve Act and regulations issued thereunder. It will be seen that the three laws are far from uniform in their provisions and that Congress and the two Michigan legislatures apparently had quite different notions as to the manner in which the exercise of trust business should be authorized and safeguarded, and the public—which entrusts its business to trust companies, national banks and state banks—protected in its dealings with them. However, perhaps this is not of such vital importance because, as a matter of fact, the safety and skill with which this kind of business is handled and transacted depends more largely upon the character, ability and experience of the officers and employes of these financial institutions than it does upon the precise nature of the laws which regulate the trust companies and the banks.

The risks and liabilities incident to the transaction of trust business are quite numerous and varied in character. A trustee is held to strict liability. The ancient legal maxim, "Ignorance of the law excuses no one," applies with greater force to the trustee than it does to the individual, and quite naturally it will apply more strictly to an incorporated trustee like a trust company or a bank, either national or state, because it is supposed to have so equipped itself that it is more expert than an individual in the discharge of the duties of a trusteeship, whether it is executor, administrator, guardian or any other trust capacity. It will probably be found also that the trust clients of a state or national bank are more likely to hold the bank to a stricter accountability and liability than if the same work were performed by an officer of the bank in his individual capacity—that is, not as an officer (as has been the case in most of the smaller communities in the state heretofore). This is particularly true for the reason that the bank official in his individual capacity has in many cases acted without compensation, whereas under the new law the bank of course will receive the legal fee.

If therefore behooves the bank, whether state or national, in establishing the trust department to make sure that its management is put in competent, careful and cautious hands. The limits of an

Digitized by Google

article of this character forbid even attempting to enumerate the great variety of liabilities to which a trustee is subject. The bank should therefore take no important step without competent legal advice; and this brings us to a consideration of the relations of the bank and its trust department with attorneys.

The attitude of the bank, so far as its relations with the legal profession are concerned, is important. A considerable proportion of the business of its trust department will come either directly or indirectly through attorneys. The policy of trust companies in Michigan is one of co-operation with lawyers. Their practice is to retain the services of the attorneys of the deceased persons whose estates are being administered, or of the persons who create living trusts with them, and of lawyers who bring business to them. The trust company is essentially a business and investment institution, and as such serves the lawyer in many ways, so that the business of the one and the profession of the other are in reality co-operative and mutually helpful. Banks with trust departments will find it profitable as well as right to follow this policy.

A few words as to the position of trust companies in Michigan (at least of those which the writer is justified in discussing), with respect to the granting of trust company powers to state banks, may not be out of place in this article. This position has been publicly stated by representatives of some of the companies at two hearings before the Michigan legislature—one at the session of 1919 and the other at the session of 1921. Briefly, it is that inasmuch as the Federal Reserve Act grants trust company powers to national banks, it is only fair and proper that similar powers be given to state banks, but that the granting of these powers should be surrounded by safeguards which will insure as safe and reliable a service in the business as has been the case with trust companies throughout their history in Michigan. The purpose of the trust companies in so doing has been to protect the good reputation which they have established for the corporate organization and management of trusts of all kinds. This attitude therefore has been in the public interest as well as for the protection of the value of the good name which trust companies have established in this state during the thirty-two years of their existence. Whether that value will be impaired or enhanced as a result of the participation of state and national banks in the trust business naturally will depend upon how well their trust departments are organized and operated and how efficiently the Banking Department or the state banking commissioner exercise their discretion in the supervision of trust departments.

The writer believes that officers of state and national banks will handle trust business in a creditable manner so long as they are able to give it their personal attention. They have been doing so as individuals in their respective communities and there is no reason to suppose that they will not continue to do so. Bankers are by habit and training naturally conservative in making their decisions upon business and investment questions, and to that extent they are well qualified to perform the most important functions of trust officers. Therefore they are not likely to make serious errors of judgment particularly if they take competent legal advice upon doubtful questions.

If, however, the volume of trust business grows to such an extent that bank officers find that the work of the trust department which devolves upon them takes so much of their time that they are unable to give efficient supervision to the banking part of their business, then naturally the interests of the bank as a whole will suffer. It is at this point that the temptation to leave the decision of important trust questions to minor officials and employes may result in loss which will subject the bank to liability and jeopardize what time, money and the most anxious to protect, i.e., the good name and reputation of corporate management of trusts. Hence the safeguards which trust company officials have recommended to the legislature as important features of a proper law. These safeguards are adequate capital, a deposit with the state treasurer for the protection of trust creditors, and other requirements, some of which are in the new state law and some of which were not included.

If the business grows to sufficient volume the bank should have additional capital, sufficient to support a trust department manned by experienced trust officers and experts in the various lines of trust business, and to protect the public which deals with it. It has been the experience of trust companies in Michigan that the trust business has not been profitable but, in fact, has been operated at a loss over a term of years, even in the larger cities, until its volume has reached the point where the gross income from fees has been sufficient to take care not only of expenses but of the trust department's share of the overhead expense. In other words, the same principle is involved herein as in the operation of a manufacturing or mercantile business — the essential element of sufficient volume to carry "overhead" and to produce profit. It is important therefore for the directors and officers of a state or national bank to determine whether there is likely to be sufficient business in the community in which the bank is located to support a safely organized trust department and to realize a profit in addition thereto, particularly if that business is to be divided between a number of banks with trust departments in the same community.

The opinion of the writer as to the advisability of establishing trust departments has been requested from time to time in the recent past by officers of state and national banks, and his reply has been to the foregoing effect. Advice and assistance in the work of establishing the machinery for the operation of such a department has been freely offered and furnished, in the belief that if the bank has determined that there is sufficient business in the community and that it can be handled profitably, it is to the interest of trust companies to render every assistance in their power to the end that the bank shall operate its trust department successfully and without mistakes, the knowledge of which mistakes spread in a community would endanger the good reputation for corporate management of trusts which trust companies have established.

There are only eleven trust companies in Michigan, with a total capital at this time of $6,337,020; a total capital, surplus and undivided profits of about $12,800,000, and total resources of $40,000,000. Up to within a very recent date permits had been granted by the Federal Reserve Board to twenty-seven national banks in Michigan, the capital of which aggregates $8,355,000; capital, surplus and undivided profits $17,000,000, and total resources (all of which, however, is employed in the banking department) about $162,000,000. There are more authorized trust departments of national banks, therefore, than trust companies within the state; but as a matter of fact very few national banks have started operation of their trust departments. Apparently the reasons for this are that it takes time to organize such a department and to find suitable men of experience to manage it; that the directorates of banks hesitate to place an additional burden of management upon the officers and to subject the bank to the infinite variety of liability involved in the relation of trustee; and that they are not entirely satisfied that trust business in smaller communities will yield revenue sufficient to make trust department operation profitable.

EDITOR'S NOTE—After this article was received for publication, announcement was made that the Governor had vetoed the MacDonald bill, giving authority to state banks to receive certain trust powers. In his veto message the Governor stated in substance that his veto was not based upon the provision of the bill. It is his contention that the bill would have permitted state banks to establish branches in foreign countries and that he was advised by the Attorney General that this would open the way to a situation under which the Banking Commissioner's power to inspect state banks could be curtailed through the difficulty of determining the condition of the branches that would be out of his jurisdiction. The provisions giving state banks trust powers were added to the MacDonald bill shortly before the adjournment of the Legislature. The situation now is, therefore, that state banks have not authority to exercise trust powers.

Mr. Stone's article, however, contains so much of interest and value to both state and national banks that it is nevertheless worthy of publication. It points out clearly the difference between the Federal Reserve Act and the Trust Company Act of Michigan. It also contains useful observations respecting liability of trustees, profits from the operation of trust departments, et cetera, which will be of value to national banks which have received permits, or are considering making application for permits, to exercise trust powers. If the granting of trust powers to state banks is to be made a subject of legislation next winter in Michigan, the article contains information respecting safeguards for the protection of stockholders, depositors, trust clients and the public which will be of value to the law-making powers.

New York Savings Banks Gain

Under date of May 27 the Savings Banks Association of the State of New York states that savings bank deposits in New York State are still increasing. One hundred per cent return to a questionnaire recently sent out to all banks in the state indicate that the total amount due depositors on April 1 was $2,574,560,350, compared with $2,532,652,511 on January 1, 1921, an increase of $41,907,839 or 1.6 per cent for the three-month period. Reports by groups show that in the industrial sections of the state deposits have fallen off somewhat, following are the comparative figures by groups: I comprises Erie, Monroe, Niagara, Ontario and Seneca counties; II Broome, Cayuga, Chemung, Cortland, Jefferson, Madison, Oneida, Onondaga, Oswego, St. Lawrence and Tompkins; III Albany, Columbia, Dutchess, Greene, Montgomery, Orange, Putnam, Rensselaer, Schenectady and Ulster; IV Bronx, New York and Westchester; V Kings, Queens, Nassau, Richmond and Suffolk.

Group	Deposits 3-1-21	Deposits 4-1-21	Increase	%	Decrease	%
I	$ 236,932,509	$ 237,068,284	$ 135,875	.05	.....	..
II	114,994,536	114,177,942	.....	..	$816,594	.56
III	231,795,670	231,802,309	.....	..	493,361	.21
IV	1,367,729,129	1,376,874,404	9,225,275	.67	.....	..
V	567,974,168	585,037,349	17,163,180	2.01	.....	..

The actual amount deposited during the first quarter of the year was $279,461,256 against $238,103,460 withdrawn, leaving an excess of deposits over withdrawals for the State of $41,357,796, according to the questionnaire returns.

One year ago on the occasion of this Convention, we ran the following ad:

"For a period of eight years we have retailed bonds and performed other services incident to an Investment Banking business for the Banks of Michigan.

"During that period we have built up what we believe to be the largest Investment Banking business in Michigan today.

"During that period the salesmen and executives of this institution, with whom the bankers in Michigan have dealt, have remained practically the same.

"Our responsibility is definite, our market is fixed.

"Just so long as we continue to comprehend the fact that the interests of the banks in Michigan are identical with our own, our business will continue to grow.

"We fully intend that the rather remarkable growth that we have enjoyed during the past eight years shall continue in the future."

One year ago we had 8 salesmen. Since then we have increased our sales organization to 30—an increase of almost 300%.

During the same twelve months we have opened and built up a *Liberty Bond Department*, more as a matter of service than for profit. This Department is now acting as a clearing house in Liberty Bonds for the majority of the banks in Michigan.

In the spring of 1920 we organized a *Stock Department*, to render to those of our customers who place a portion of their funds in stocks and to that class of investors who buy only stocks, a high-grade investment service in stocks.

During this same year we have materially enlarged our *Municipal Bond Department*, specializing in Michigan Municipals.

The Detroit office, to which 9 salesmen are reporting at the present time, was opened during the year 1920 under the management of Mr. Charles S. Lee, with offices at 872 Penobscot Bldg. This office was made necessary by our growing business in Detroit and the eastern side of the state.

Our growth is only in line with the growth of this wonderful state and it is our hope that at the end of the next twelve months we shall all be able to look back on a period of marked progress and accomplishment.

The 57 Varieties Of Financial Institutions

A Tabulated List of a Few Titles Commonly Employed And a Definition of the Functions of Each of Them

THE WORD "banker" is made to cover a multitude of financial activities, these days. The man who sells you a draft on Prague or Stockholm is sometimes called an international banker with the same readiness that J. P. Morgan & Company are described in the same terms. Likewise the man who opens an office on the "ith" floor of one of our office buildings and prints "Investment Banker" over his door in gold letters is often credited with the same standing that is given a dealer in high grade bonds. But it has been deemed that a code should be adopted whereby the public may be informed accurately of what financial titles are most generally supposed to mean, and also what misnomers the various titles may be. Therefore there is given below in tabular form a few titles of financial institutions, with a definition of the kind of business each title is supposed to represent, and occasionally a definition of some kinds of business that are often carried on under the same title.

Title	*Business Generally Conducted Under This Title*
Commercial Bank	Takes in deposits of merchant, manufacturer, municipality, club, individual, estate, etc., and lends the money to same class of borrowers for short terms. Makes collections; sells drafts, both foreign and domestic; issues letters of credit, travelers' checks, etc.
Savings Bank	Takes in deposits of funds intended as an accumulation toward an investment or intended as a reserve against contingencies. Bears the same relation to a commercial bank that a family hotel bears to a transient hotel. Because deposits do not fluctuate so violently, can make loans for longer periods and on less readily convertible security.
Trust Company	In Michigan the law confines a trust company very largely to a strictly trust business, such as acting as administrator, executor, receiver, and in similar trust capacities. The laws throw special safeguards around the investment of trust funds but there are no restrictions as to the investments of the company's own corporate funds. It may hold real estate in trust but is not permitted to do a general banking business. In many other states the title "trust company" is a misnomer. Trust companies in Ohio and Illinois may do nearly everything in the banking line that national and state banks may do, in Texas and some other western and southern states their powers are even broader. Thus a person should not be misled into thinking that the term "trust company" means in all cases the same kind and high character of business conducted by trust companies in Michigan. There are instances of record where trust companies have been formed which are merely adjuncts to fraudulent schemes. The legislature of Michigan is very jealous of the use of the terms "bank" and "trust company" and there are special statutes governing this subject.
Trust & Savings Bank	In states where separate incorporation is not provided for, this title is often adopted because of the peculiar business-getting force it has developed in certain communities. It means literally that the bank is doing a trust business in connection with a savings bank business; but the instances are rare where this is strictly adhered to. For example, the Illinois Trust & Savings Bank, Chicago, engage in the bond business and many other activities not strictly either savings or trust activities. On the other hand, the Central Trust Company, Chicago, engages in nearly every form of banking and bond business, besides conducting trust activities. Likewise with the Northern Trust Company, Indiana and Ohio are conspicuous in this respect.
Morris Plan Bank	Also known as the industrial bank. Chief function is making loans to wage earner on bank's indorsed note, to avoid evils of salary assignments and other abuses common in small loan business. Small loans are also made for purchase price of household articles. The bank retains a lien. Rate are midway between ordinary bank rate and "loan shark" rate and are so permitted by statute to cover extra cost in handling large number of small loans.
National Bank	By incorporating under the national law a bank elects to be governed in its loans and activities by the charter rights granted by Congress and to be supervised by Congressional authorities, although such banks are amenable to state law in all civil contracts. A national bank may use United States bonds of certain issues as security for its own circulating currency notes [first to the war and before the creation of the Federal Reserve Banks the national bank currency formed about 40 per cent of our paper money. On January 1, 1920, the total paper money outstanding was as follows:

United States Notes	$ 346,681,016
Federal Reserve Notes (all)	2,561,811,842
National Bank Notes	724,338,892
	$3,635,931,653

It is not mandatory any longer for a national bank to issue circulating notes. The Federal Reserve Banks are buying up the government issues which have heretofore formed the basis of national bank currency.

National banks are not divided into commercial and savings banks in their articles of incorporation, the charter rights carrying both privileges regardless of the name adopted. Until recently, savings departments were not conspicuous in national banks. National banks also have trust powers by a recent amendment to the Act.

State Bank

By incorporating under a state charter a bank elects to be limited by the charter provisions of the legislature of the state in which it is organized. In Michigan the state banks may incorporate as "commercial banks" or as "savings banks," or as combined commercial and savings banks, but if both kinds of business are conducted, the books and accounts of each department must be kept separate and the assets of each must be marked so that each may be identified. To all intents of the law, such an institution is really two banks operating under one roof. Michigan has an unusually rigid law covering the investment of savings deposits, which is pointed to by many observers as a reason for the absence of state bank failures in recent years.

Savings banks are required to invest about one-half of their deposits in high grade bonds—government, municipal, first mortgage, railroad—and first mortgages on real estate. There is another provision requiring about one-third of the deposits to be invested in loans collateraled by readily marketable securities having a safe margin over the amount of the loan. State banks have no currency-issuing powers but such state banks as belong to the Federal Reserve system may obtain federal reserve currency directly from the latter.

Federal Reserve Bank

A bank which does business with banks. It is a bankers' bank. It takes in the bankers' money and it lends money to the depositing bankers. Its other functions are (1) to provide a medium, or the machinery, whereby member banks may keep readily available reserves and (2) wherefrom they may obtain currency or credit in times of emergency.

Under the old system the actual available "reserve" of an ordinary bank, beyond money in its vault, was hard to ascertain. The Michigan country bank, for example, kept 20 per cent of its deposits in a Detroit bank. The latter kept 25 per cent of this sum in New York, and New York kept 20 per cent on hand in real money. Tracing it back, the Detroit bank kept in real money $2,000 of the $10,000 belonging to the country bank and the New York bank kept $400 of the real money left of the $2,000; so that in the final analysis there was only $400 in real cash behind the $10,000 reserve shown on the books of the country bank.

Now under the Federal Reserve law, each Federal Reserve Bank keeps in gold or lawful money 35 per cent to 40 per cent of the deposits made with it by member banks, so that the same country bank, carrying the forwarding paragraph, if it now belongs to the system, has actually available $4,000 in gold; and the Federal Reserve Banks have behind the remaining $6,000 in currency, if needed. The contrast is very striking.

Under the old system the only currency of the land was government notes and national bank notes. And neither could be issued fast enough in times of emergency to be of much use.

The Federal Reserve Bank, in contrast, can now issue currency in short order to its member banks upon approval of certain high grade paper offered to it by the members of the system. Thus a state bank, which is an "orphan" insofar as currency-issuing power is concerned under state charters, obtains a privilege held only by national banks prior to the creation of the Federal Reserve.

Incorporated banks are eligible for membership. They must subscribe for stock of the Federal Reserve Bank of their district to an amount equal to 6 per cent of their capital and surplus, only one-half of the subscription has been called for payment to date.

Federal Land Banks

A system of regional banks patterned somewhat after the Federal Reserve system and intended to enable farmers to obtain long-term loans at minimum interest rates. Under the act a certain number of farmers may get together and form a local association for the purpose of making loans to them. Late in 1920 there were 3,386 farm loan associations in the system, with total mortgage loans of $75,890,204 made by Federal Land Banks through these associations to about 13,000 farmer borrowers.

The Federal Land Banks have had a hard row to hoe right from the beginning in 1916. In spite of the fact that Congress provided that the U. S. Government furnish formal approval of all the capital the farmers did not supply and should buy about half the outstanding bonds to keep the system in operation.

The Farm Mortgage Bankers' Association attacked the validity of the tax exemption feature of the bonds and has opposed the farm loan banks as being an encroachment on the private farm loan business. But on February 28 this year the Supreme Court of the United States upheld the constitutionality of the tax exemption feature of farm loan bonds. It is interesting to note that of the $5,000,000 capital provided, the Government had to take $4,881,270 and that it also was obliged to buy $183,000,000 of the bonds. It was intended by the framers of the act that the farmers would supply the capital and that the public would buy

Digitized by Google

the bonds. "The loss to the government by reason of the tax exemption feature of these and other tax exempt bonds is running close to $800,000,000 annually," says the Wall Street Journal.

This species of legislation is a splendid example of the trend toward socialism and the political dangers of tax-exemption. Money raised by federal taxes is used to make loans to a class of citizens; then the burden is further unevenly distributed by making provision so that the wealthy bond purchaser can escape his share of the tax burden by buying these securities which are tax exempt.

Private Bank

An institution owned and operated by an individual or a firm and which conducts usually all kinds of banking business without supervision of state or federal authority. Illinois recently passed a law requiring private banks to submit to state examinations. A private bank can invest its depositors' money in the same manner as any individual. There is no protection except the honesty and prudence of the private banker. Up to a short time ago there were about 250 private banks in Michigan outside of Detroit. The Ellis private bank at Grand Rapids, which closed recently, was said to be the largest in the United States outside of New York, having deposits of more than $4,000,000.

When the owner of a private bank dies, the debts or liabilities of the bank are settled in the same manner as the personal debts of the owner. Grand Rapids has been given a good example of this weakness in the death of George E. Ellis, the depositors having waited about three months for their money, and with little prospect, as yet, of a 100 cent payment. Private bank losses in a private bank are usually disastrous to depositors as compared with incorporated banks. There in Michigan has been examples of this side by side. In a certain private bank which lost about $100,000 through depleted assets, the depositors have waited many weeks for settlement, while the close-by incorporated bank, which had a loss of several hundreds of thousands of dollars at about the same time, has more than or has been abut a day. It is said there are only three states in which private banks may operate.

Foreign Trade Bank

Under an amendment to the Federal Reserve Act known as the Edge law, incorporated banks may take stock in a bank organized for the promote foreign trade by handling exports and importing. There are two main kinds of Edge law banks—first those which make a specialty of purchasing acceptances and short-term paper arising out of export or import business and, second, those which make a specialty of granting long-term credits to foreign purchasers and who finance these investments by issuing debentures secured by a pool of foreign paper so acquired. There are some 40 banks in this country now in operation. The principal example of the latter, the proposed "Foreign Trade Financing Corporation," with $100,000,000 capital, is now in process of organization. The intention is to provide by various titles but the general purpose of their organization is to get together large accounts which the individual banks of cities of business which ordinary commercial banks are not equipped to accommodate.

Investment Banker

An individual, firm or corporation that makes a business of buying large blocks of high-grade bonds, notes, stocks or other securities and sells them at a profit to individuals, estates and banks. The real investment banker handles his securities in much the same way as any high-grade merchant. He buys in quantities at one price and sells in small lots at a higher price. After a new issue has been entirely disposed of to investors it often happens that some of the purchasers wish to sell their securities, and in this situation he acts either as broker, by finding a buyer and charging a commission for making the sale of services, or he re-purchases the investment himself in the expectation of selling later on. When new issues have been entirely sold to parties who hold them for investment purposes, it is then said that the issue has been "digested."

When the issue is large there may be several "wholesalers" between first purchaser and ultimate investor. This is necessary because no one firm can have command of a sufficient number of customers to sell all the bonds direct. In this event the process of distribution is much like the handling of any commodity between manufacturer and retailer. The underwriting syndicate of which contracts in the first place to buy the issue is the wholesaler; next come a number of sub-agents, corresponding to the jobber; and each sub-agent has a number of connections which do the retailing.

The title "investment banker" is often corrupted by persons who deal in highly speculative stocks or promotion schemes, and it behooves an investor to make careful inquiry.

The class of securities handled by bankers in this classification may vary in each concern. Some make a specialty of real estate bonds, others municipal bonds and still others in public utility bonds. But in all of these the true "investment banker" endeavors to sell only such securities that by reason of past performance are entitled to the term "investment."

Land Credit Bank

A term borrowed from Europe. There is a strong similarity between our Federal Land Banks and the land credit banks of Europe. In both the borrower becomes a depositor as well. After a borrower has received his loan he continues to be a depositor and the gathering together of large numbers of small deposits furnishes a fund which members in turn may borrow. Ordinarily the form of organization is mutual.

Mutual Savings Bank

These institutions are not organized for profit to stockholders. The depositors are the owners and the business is managed by trustees, who are paid nothing beyond salaries. The profits that ordinarily would go to stockholders become available for distribution in the form of higher interest rates on deposit than privately owned banks pay, or are used to build up a reserve against losses. New York has several large savings banks of this type. Deposits of the Bowery Savings Bank, New York, for example, are about $100,000,000, and of the Seamen's Bank for Savings, about $80,000,000. There is another prominent example in Minneapolis.

Discount Corporation

Organized to purchase commercial paper given in payment or part payment for goods and chattels. Persons buying stock in such concerns become partners in the enterprises and share profits and losses in accordance with the rise and fall of the prosperity of the business. Of late years partial payment notes given for automobiles and pianos have formed the major portion of the business of discount companies.

Finance Company

Objects are much the same as those of the discount corporation, although the scope of the finance company undertakings is often much broader and includes discounting land contracts, buying second mortgages, etc., in addition to automobile discounts. In fact, the charter rights of some finance companies are so broad that almost any financial undertaking short of a general banking business or a trust business may be conducted.

Bond and Mortgage Company

The general run such concerns handle real estate bonds, although there are many that do not so confine themselves. Owners of real estate requiring larger loans than any bank or single investor is apt to make mortgage their property to a trustee, who holds title and collects in addition to standard denomination which in the aggregate equal the face of the mortgage. Thus a small investor enjoys the same degree of safety as one who might lend the whole sum.

Stock Broker

An individual, firm or corporation whose principal function is to act as go-between for buyers and sellers of stocks. He also raises capital for new enterprises. Those who are members of recognised exchanges must abide by rules of trading, commissions, etc., and the standing of the exchange to which they belong is often a good measure of the integrity of the individual brokers.

Clearing House

A voluntary association of banks which performs at one place and at one time the exchanging of checks between its members. In this respect it is a labor-saving device. The members agree mutually to certain regulations also to rates and charges in order to promote safe banking conditions. Before the Federal Reserve Banks were organized, the clearing house associations in time of panic issued clearing house certificates which passed as currency.

Foreign Exchange Banker

An individual whose principal business is selling drafts on foreign points and transmitting money. Some have their own funds deposited in foreign banks, against which they issue their own drafts or checks; others simply work on commission. In Michigan dealers in foreign exchange must obtain a license from the banking department of the state and are subject to periodical examination by state authorities.

Building & Loan Associations

According to Chas. D. Hanchett, secretary of the Detroit and Northern Michigan Building and Loan Association, Michigan is very backward in the matter of investments in co-operative building associations as compared with other states. He states that Dayton, Ohio, has $55,000,000 in assets, Columbus, Ohio, $55,000,000, Cincinnati, Ohio, $46,000,000, Cleveland, Ohio, $60,000,000, with a grand total for the state of Ohio of $525,000,000 against a total for Michigan of about $50,000,000. Pennsylvania has $475,000,000, New Jersey, $238,000,000. Comparing individual associations he states that Columbus has one with $21,000,000 of assets and Youngstown has one with $14,000,000 of assets, while in Michigan the largest has only $7,000,000 of assets. Pennsylvania heads the list as to members, having 2,785 associations with more than 1,000,000 members who in 1920 built 42,000 homes. Ohio follows with 777 associations having 972,000 members. Michigan comes ninth with 75 associations having 99,000 members. It is proposed to exempt income from stock in these associations up to $500 in order to stimulate investment therein.

It should be borne in mind that with 48 different state laws there is bound to be conflict in some of the above statements. These titles have been described from the Michigan standpoint.

MERCANTILE FAILURES IN THE UNITED STATES

The Modern Bank Building as a Civic Asset

What It Means to the Institution Which Erects It, And Its Influence As Well Upon the Community

By NOBLE FOSTER HOGGSON
President, Hoggson Brothers, Builders, New York

IT IS CONSIDERED a perfectly natural thing for the stranger coming into a community to place his money in the care of that institution which by its exterior aspects convinces him of its dependability. Although it is perhaps only the effect of imposing columns and dignified architecture, subconsciously the stranger's mind is put at ease and he leaves the bank of his choice satisfied that his money or securities are safe. And rightly so, for was that not the purpose of those who decided to erect such a building—to construct a home which would reflect correctly the good faith and stability of the business men who controlled the institution? Furthermore, was not the decision of these bankers in keeping with their civic responsibilities?

The man who is charged with caring for the funds of his fellow citizens must have a lively sense of his obligations to the community over and above finances or he is failing short of what his patrons and the public at large have a right to expect of him. He must be a civic leader.

Civic spirit in the banker may be most readily and signally exemplified by the building in which he transacts his business. It often happens that the best index to the progress and prosperity of a community lies in the outward aspect of its bank buildings.

In these days of strenuous advertising, when banks spend large sums to keep their names persistently before the public, an impressive building is at once the best investment and the best advertisement a bank can have. The building stands, day in and day out, consistently advertising the institution it houses. The city claims it for its own, as a civic improvement, a thing of beauty and worth; each depositor has a real joy in the consciousness of part ownership and every resident in the community refers to it with pride.

The value of this perception on the part of the public is peculiarly effective. One who has contemplated the "psychology of increased deposits" can readily comprehend the effect that a dignified and substantial bank building has on the public mind, and the confidence it begets. The building typifies the institution and both become capitalized in the minds of the public. The investment of capital in an edifice for a banking institution for the carrying on of its principal business inspires the public with a sense of faith and security in the stability and prosperity of the institution. Increase in confidence brings about increase in deposits; thus the money invested in the new building becomes a paying investment and an asset.

Unconsciously, other people look to the banker to set the pace. Let the bank take the lead in an architecturally ambitious building and the next project in a community is either a new post office, new school building or a public library. As his initiative in building may make over a small community, so in the larger cities the banker may make over his district, increase real estate values and bring about an acceleration of enterprise that returns his investment four-fold. The banker who takes stock of the community's needs in the way of building and deliberately sets about to give his town or his neighborhood the proper turn in its building operations, at once puts himself in the position of dominating the more potent features of the civic life of those with whom he comes in contact. He has acquired a new leverage on prestige and on patronage. Incidentally he has chosen while it is yet to choose what shall be the architectural setting of his financial life. That setting does not end with his own building but extends to his block, his street and his district, if not the entire municipality.

There are bankers who can trace their greatest success back to the day when they realized that the town or the district needed more than anything else a modern office building. Others are happily reminiscent of the time when they decided to displace the antiquated home of the bank with one of imposing beauty and utmost convenience. There is no better, more practicable application of the civic spirit, no better advertisement, no better civic investment for a bank than to create a home for itself that shall raise the tone of building operations in the community.

Similarly there is no aim more worthy of attainment than that of becoming an expert in the planning and erection of bank buildings. For no bank building is built unto itself; it is, in the very nature of things, the heart of that body which is its sphere of influence. He who creates homes for banks must have the vision to see the buildings that are to follow. Personally I should not care, if I were a banker, to engage an expert who could not, in his mind's eye, see not only my own building but the other buildings which must, because mine is erected, occupy the sites nearby. And I should much prefer one whom I could commend to my neighbors even before he had completed the task I had set him. I would not want my Roman-Doric example of civic pride to be placed on the wrong side of the site—a site upon which its influence would be lost. I would want his advice upon that subject, after a survey of the environs. Neither would I wish to erect a more obviously utilitarian building—a skyscraper, let us say—among surroundings the changing exterior of which might defeat my highest hopes.

Civic examples are not confined to exteriors, however. Interiors which show taste and convenience are business producers and waste savers, and as such are the best possible civic criteria. One banker of my acquaintance turned the tide which had set against his institution and came within a very few years to dominate the finances of a city of 500,000 by building a skyscraper and attracting a host of small depositors to his institution by the happy arrangement of a hopeless looking basement room. The impressive first floor was devoted to the counting-rooms of his bank, but for his struggling trust company, which was to feed the bank, he took the basement or half-basement.

Into that basement was put, in compact shape, every modern convenience for trust company banking. No minor official or attache of that institution suffered from overstrained nerves, tried eyes or a hopeless rush of work. What machinery could do, machinery did, and the lighting and ventilation were perfect. From behind the harmonious screen of marble and bronze grille peered no tired faces. The working force was alive to its possibilities and banking was apparently the joy of its collective life.

Just as harmonious and modestly impressive were the railed off but otherwise entirely open offices of the officials of the institution, bringing them in close personal contact with the patrons. Best of all, there was a generous lobby, there was no pushing or crushing in the rush hours, and the lines were under the constant eye of some solicitous official.

At bottom it was a building problem solved by a bank planning expert that brought the head of this group the financial domination of this city. No less important than the towering skyscraper was the half-basement, which was so well utilized that it carried at once to the attache, the official and the patron a sense of virile confidence that literally made millions for the bankers who constituted the group under the leadership of the far-seeing president.

While no two banks need be alike, all banks should know about and take advantage of the many new ideas in construction and improvements in equipment which have been tested and found to be essential and economical for conducting modern banking.

There are special conditions affecting the lines of activity of different banking institutions which require individual study. One bank conducting a strictly commercial business discovers that the new arrangement of the officials' desks has the effect of pleasing its customers, who see in the new layout a compliment to themselves. The practical working of the "open door" policy has untold value.

Another bank in its new building finds not only that the business is carried on much more easily and effectively, by reason of the increased public and working spaces, but that by the scientific arrangement of the working space the employes are able to get the greatest amount of competent usefulness with the least amount of effort.

In other banks the problems presented by narrow lots are overcome, the very obstacles lending a zest and presenting a challenge that brings into play the best resources of the designers, affording happy and skilful results.

A Stock Exchange

Its Functions, Operations, Rules and Its Place In the Financial Machinery of the City and Nation

By JACOB NATHAN
Secretary of the Detroit Stock Exchange

A STOCK EXCHANGE is the common meeting ground of the owners of corporation securities; that is to say, the exchange is the central point of clearing house through which one may enter either buying or selling orders. And inasmuch, of course, as it would be physically impossible and otherwise undesirable to have all of the owners meeting together to transact their business, their orders to buy or to sell are executed by brokers banded together in the form of an organized stock exchange. Thus likewise does a commodity exchange serve those who buy and sell those commodities for which such exchanges are organized. Therefore we have coffee exchanges and cotton, grain and other organized centers or markets of distribution.

It must be borne in mind that notwithstanding that a stock exchange merely clears or performs transactions in scraps of paper, each piece of paper represents a definite ownership in the property and earnings of a corporation. The exchange, then, is neither a buyer nor a seller of either securities or commodities; it is merely the meeting place of those who hold commitments for the actual owners of the securties or the commodities. Without such institutions as stock exchanges there could be not great body of security holders because there would be no convenient or ready or stabilized market in the event holders wished either to buy or to sell.

The owner of a security demands that he be able to buy additional securities or sell what he already possesses immediately he determines to do so. The holder of a security must be in position to convert his holdings into cash without delay, as business interests may demand. The general trend of the market may make it imperative; at any rate the ready convertibility of a security into cash is what makes this form of investment desirable; consequently the stock exchange facilitates these transactions in that there is ever ready a group of brokers any one of whom will promptly negotiate the transaction desired.

Of paramount importance also is the maintenance of uniform prices for securities. Let us assume that there were no stock exchange in existence and the securities of a certain corporation were in the hands of 5,000 owners distributed in various cities. What would be the ruling price of that stock in any certain period? Admittedly there could be no uniform price because while one person was offering to sell at a certain price in one community others might be offering to sell at greatly varying prices in other communities. But with the bulk of the orders in those securities going through an exchange as a common market place the price is stabilized and the holders of that security, no matter where they may be located, know at all times and under all circumstances, the value of their securities.

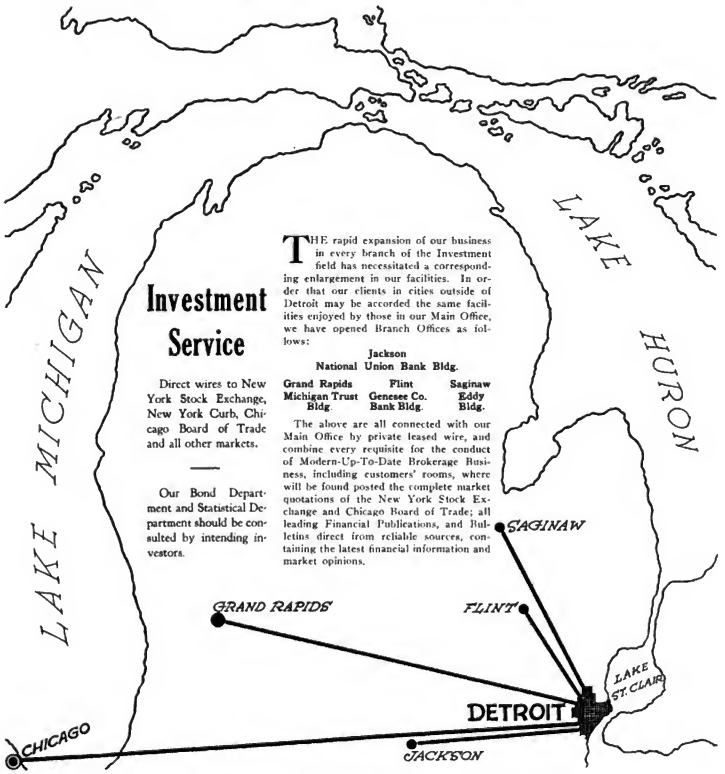
The stock exchange is one of the most important cogs in the wheels of finance and industry. It has its definite place in the country's great financial and industrial structure. Industry cannot expand and grow without capital. When a corporation issues securities to make such expansion possible it merely invites an added number of partners in that particular business. On the other hand, individuals invest in the securities of industrial corporations because as a rule those securities sooner or later are listed on a stock exchange and the market value is thus established uniformly.

Were there no stock exchanges and were it thus impossible to main a stabilized market value for securities, corporations would find it difficult if not quite impossible to obtain distribution of such securities as would make it possible to expand their business. True, banks and other financial organizations do underwrite or buy the issues of securities of such corporations; but do not lose sight of the fact that the banks and other organizations who perform this function are merely wholesalers. That is, they take the securities in wholesale lots, apportion them among brokers or selling agencies and the latter in turn become retailers. The public in all events must be the ultimate consumer.

This does not mean that banks and other financial institutions do not buy corporation securities for investment. Their principal function, however, is to act in the capacity of wholesale distributors. They would find their task, however, a difficult if not an impossible one, if as already indicated there were no stock exchanges through which the ultimate consumers could eventually find a protected and a stabilized market.

When I say a protected market I incidentally touch upon another very important function of a stock exchange. When a security is listed upon the exchange a searching investigation as to the corporation's financial standing is made. It is then required that such corporation at all times keep the exchange fully informed as to its progress, such information including statements of earnings at frequent intervals, of details of dividend declarations and all other matters as pertain to the general progress and development of the corporation whose securities are thus listed. This information immediately is given to the public. The owners of a corporation's securities are kept advised as to what progress their business is making. When a corporation refuses thus to take its stockholders into its confidence an exchange will throw such listing off its board. When it comes to pass that an exchange can no longer adequately protect the market in any of the securities listed with it, then such listings are removed and the responsibility placed squarely upon the shoulders of the corporation. It is because of this that the bulk of the vast amount of securities transactions in the United States consists of securities listed on the various stock exchanges.

Publication daily of quotations of the various exchanges is another expedient by which a stock exchange aims to protect the stockholders of corporations and the market in general. The daily stock exchange quotation list is the barometer by which the holder of securities may determine his course. Without such publication of quotations there could be no uniform or protected market and there can be no such fair and impartial list unless it comes directly from a stock exchange.



What Are the Advantages, Both to Corporation and Stockholder, Of Having Stock Listed on a Recognized Exchange?

THE STOCKHOLDER PUBLIC has become so accustomed to the benefits of the stock exchanges of the country that there has grown up a "take it for granted" attitude toward listing stock. In some respects the situation is much like that of many good men who fail to appreciate their wives until death comes along and suddenly wakes them up to a realization of what the wife means.

Organized market institutions are not new. By looking back a few hundred years we can trace the growth of many cities to their prominence as reliable market places. The Forum of Rome was without doubt the most famous market institution of that age, and it is said that long before the organization of the Roman empire the forum was a market place for cattle. Strangely enough, even now the Italian peasants still drive their cattle to the market place. In our own stretch of history the Chicago grain market exerted a powerful influence over the destinies of Chicago as a business center long before it became a great city because of other factors which we now commonly point to.

Underneath it all the thing that brings a buyer to an organized market of any kind is confidence. It is a confidence that buyer and seller will meet on a basis of fair play and a confidence that the man appointed as agent will deal fairly. In handling commodities business men are all in agreement as to the benefits to be derived from having

Investment Service

Direct wires to New York Stock Exchange, New York Curb, Chicago Board of Trade and all other markets.

Our Bond Department and Statistical Department should be consulted by intending investors.

THE rapid expansion of our business in every branch of the Investment field has necessitated a corresponding enlargement in our facilities. In order that our clients in cities outside of Detroit may be accorded the same facilities enjoyed by those in our Main Office, we have opened Branch Offices as follows:

Jackson
National Union Bank Bldg.

Grand Rapids	Flint	Saginaw
Michigan Trust Bldg.	Genesee Co. Bank Bldg.	Eddy Bldg.

The above are all connected with our Main Office by private leased wire, and combine every requisite for the conduct of Modern-Up-To-Date Brokerage Business, including customers' rooms, where will be found posted the complete market quotations of the New York Stock Exchange and Chicago Board of Trade; all leading Financial Publications, and Bulletins direct from reliable sources, containing the latest financial information and market opinions.

Orders executed in any market in the country. All listed and curb stocks bought or sold for cash or carried on conservative margins.

Monthly Payment Plan: Stocks or Bonds may be purchased for investment by paying a small percentage down and the balance monthly. Write for our booklet, "Savings Opportunities." It explains this plan fully.

Listed and Unlisted Stocks

Government - Municipal - Corporation Bonds

an established market place, yet when it comes to securities many of the same men disagree. Why this should be can be explained only by the apparent fact that business men are not as familiar with stock markets as they are with cattle markets or grain markets or perhaps automobile markets.

For an illustration of the advantage of having a stock listed let us take a particular case which came to the writer's attention recently. There was a physician who was possessed of 100 shares of a certain truck company's stock and who was very anxious to sell the same. He noticed in the daily papers that Broker & Company "specialized" in his particular stock, so he called them up and asked for a quotation. The ensuing conversation was something like this:

Doctor—"What can I get for 100 shares of ———— stock?"

Broker—"That's hard to say. It was selling around $10 a share, but there haven't been any bids recently. What is the least you would take for your stock?"

Doctor—"Why, I want par of course. That's what they told me I could get if I wished to sell at any time. Anyhow, the company is making lots of money and will soon pay a dividend."

Broker—"Who told you about the large profits of the company, and did you ask them to buy your stock?"

Doctor—"I asked the company to buy my stock and they said they were perfectly willing, but at present they had all they wanted in the treasury. They said they were making good profits and I would be foolish to sell now."

Broker—"If you will give us exclusive sale of your stock for a few days we will try and find you a buyer, but so little is known about the affairs of this company that investors are all in the dark as to its real value. You know this is an unlisted stock and no one outside of the company is given any authentic information."

The physician agreed that the broker should have a ten-day option on the stock at $10 a share and the broker spent several days trying to find a buyer, but every investor approached shied for the same reason—that there was nothing definite on which to base the purchase. Finally the broker found a man who was willing to give $5 a share for the stock. He called up the physician, who promptly refused to consider such an offer and furthermore roundly abused the broker for "trying to swindle me."

As often happens, the physician called up another broker. This time he received similar advice but was told further that if he did not accept $4 or $5 a share now he might not be able to get very much, if anything, later on. He was dealing now with a broker who did not belong to the stock exchange and who was entirely out of sympathy with the idea of getting his customer "the market value" for his stock. The broker promptly got into touch with some unsuspecting parties and told them he could sell 100 shares of the stock at $12 a share, which was readily accepted, for the parties had been led to believe the company was in good condition and about to declare a big dividend. He then went back to the doctor and bought the stock for $5 a share. Doctor lost $500; broker made $700.

Now if this had been a listed stock the story might have been wholly different. The doctor's first broker would have had on file periodical financial statements of the company, which would have enabled him to arrive at a fairly accurate value of the stock, and the record which the stock exchange would have kept of sales would have given a good idea of market value, in addition to which there would probably have been a recorded bid as a current indication of the "market value" of the stock.

Here, then, is an example of manipulation, and it is the confusing of deals of this nature with the popular notion of "stock exchange manipulation" that gives rise to the latter. A stock exchange, rather than being an aid to manipulation, if properly conducted, is more a defense against it. People will speculate as long as there are seasons of weather, changes in the yield of grains and as long as the tide ebbs and flows, and no law or set of laws will ever prevent it. But the stock exchange tends to discourage dishonest speculation in requiring persons who wish to buy stocks to back up their bids with cold cash when the seller accepts, and vice versa.

Once in a while there is some attempt to do away with speculation. We learn from J. Edward Meeker, writing in the Magazine of Wall Street, that "the only man who has ever seriously attempted permanently to close the organized speculative markets is Nicolai Lenine, the Bolshevik autocrat of Russia, and that as a result of his efforts, speculation has grown in every commodity, even though he has forbidden it under penalty of death; and that the net result of his attempted improvements has been the economic prostration and ruin of industrial Russia."

For another example of the value of having stock listed we have fresh in our minds the action of Sears, Roebuck & Company common stock early this year at the time it was believed the dividend rate was going to be cut. It had become common knowledge before Christmas that the business of the mail order houses had suffered severely by

Digitized by Google

reason of the business depression, and as a result the stock began to drop down a few points each day; but there was scarcely a day when it did not regain two or three points of its loss, due to what? To the fact that there were speculators who had faith in the company and believed in the eventual recovery of the stock. This steady day-by-day drop in price of the stock was a forerunner of the dividend action which followed in February, and it was the signal to the man who wanted to raise money that he had better sell while the selling was good. Many people did sell; but the point is, had there been no speculators the stock would have toboggoned swiftly and investors would have been obliged to take one-half of the price which speculators offered, and had there been no organized exchange, the stock might have sold for $95 in Chicago, while it was selling for $65 in New York, or vice versa.

It is perfectly conceivable that a close corporation with only a few stockholders might reasonably decide that listing its stock had no advantages for its particular case. But every so often something happens to demonstrate how listing its stock and making periodical reports could be of value to most any corporation dealing with the public. Recently a man walked into this office and asked what we knew about the ———— Motor Company. The stock not being listed, the public had never been given much information about the finances of the company, and this party, having in mind the purchase of one of the company's automobiles, was anxious to find out whether the company was in good enough financial shape to withstand the continued business depression. For as the intending purchaser expressed himself, "I do not want to buy a car that will be an orphan six months from now." Inquiry was made direct to the company, which replied that it was not its custom to make its affairs public. Putting it in the words of the treasurer, "we do not believe in advertising it every time we make a dime or lose one." Result in this case was that the inquirer bought a car of another make which had listed its stock on an exchange and had made it a policy to keep its customers posted as to its finances.

Charcoal Iron Supply Vital to Industry

Every Economy of Production Utilized by Michigan Corporation; Best Working Conditions Provided for Employees in All Departments of This Great Organization

BY-PRODUCTS PLAY BIG PART IN OUR EXPORT TRADE

Ashland, Wisconsin, Plant of Charcoal Iron Company of America

WE AMERICANS like to think in superlatives. We admire the thing that is the largest of its kind, the thing which excels all others of its class. And, because we think in superlatives, our national achievements have been superlative ones. The spirit of emulation produces accomplishment and American greatness is founded on accomplishment.

On the immensity of its iron and steel industry the industrial prosperity of the United States has been built. Because we have the biggest resources of iron ores and have developed the most complete method of handling them, from the mine to the finished steel product, our nation holds its high place among the peoples of the world.

But quality as well as quantity of steel production is necessary and the aristocrat among the materials of the American iron industry is charcoal iron. It is natural that the leading charcoal iron company of the United States should also be the greatest company of its kind in the world.

The Charcoal Iron Company of America, which has its offices in Detroit and its lumber tracts, mine, mills, chemical plants and blast furnaces in the upper peninsula, is typical of American methods, in that it comprehends within its organization all of the component parts and processes to produce a high-grade product with every economy and in a constant and dependable volume. It is a self-contained organization, the amalgamation of various units which have a natural relation to each other and its management has been progressive in installing every new and better kind of equipment and has also been conservative in upholding a uniform and high standard for its output.

To say that the Charcoal Iron Company of America produces annually 120,000 tons of charcoal pig iron, 1,500,000 gallons of wood alcohol and 25,000,000 pounds of acetate of lime is but to give a glimpse at its real meaning as an institution.

To understand what that statement of output means, we

Digitized by Google

must know the means by which it is created and also the uses of the product itself. As to the latter, charcoal iron is recognized as the ideal material for high-grade castings. It has a low phosphorus and sulphur content, and from it are made castings which are strong, tough and yet easily machined and which are capable of receiving the highest polish. The cylinders of motor cars require just this sort of castings and it is a great advantage to the American automobile industry that there is a dependable supply of this valuable material right at hand and always available.

Now that our manufacturers are competing in the markets of the world on a quality basis to a greater degree than ever before, charcoal iron is a national asset in our foreign trade because of the great variety of uses to which it can be put in our factories.

As to direct export of charcoal iron, the standpoint of the Charcoal Iron Company of America is now, as it has been in the past, that our American industries had first call upon its product and that its iron could best find its way into world-wide use through incorporation in articles made in this country.

About 5,000 persons are in the company's employ, and its policy has been to maintain the best working conditions in all of its branches. Its properties include the Yale mine at Bessemer, with an annual output of 500,000 tons of hematite ore, four blast furnaces and three chemical plants. In addition, there are its lumber camps and saw mills.

Long before the use of coal for making iron and steel was thought of, men smelted the iron ores in furnaces where wood was employed. They discovered that the hard woods produced the finest iron, and no method has ever been discovered to improve upon the quality of hardwood charcoal as an ore smelting agency.

NOT SO long ago, as the life of a nation is considered, the iron furnaces of western Pennsylvania depended upon charcoal for their fuel. Then, as the forests vanished—to be replaced by the great agricultural and manufacturing districts of the present—the use of "stone coal" in the furnaces was begun and the fact that vast stores of coal were available in the mountains of Pennsylvania determined the future of the iron industry in that section.

But in the great upper peninsula of Michigan, close to the

Newberry, Michigan, Plant of Charcoal Iron Company of America

There is a more direct export use for the other articles of manufacture of this company. Its chemicals are used in making formaldehyde, in the solvents needed in the rubber trade in Africa, South America and elsewhere, for the manufacture of cordite in Great Britain and France, for the making of aniline dyes. Every civilized country—even as far away as China and Japan—requires these chemicals and they form a notable item in our exports.

Just how vast an organization is involved in the manufacture of charcoal iron by this company is evidenced by the fact that it owns 200,000 acres of land in the upper peninsula. It has its own railroads, with a trackage of approximately 100 miles, connecting with two transcontinental lines, its own locomotives and cars. Even roundhouses and repair shops for its rolling stock are required.

Gogebic, Marquette and Mesaba ranges, there was a wealth of virgin timber and the opportunity to begin anew the production of this higher-grade iron. From comparatively modest beginnings, the Charcoal Iron Company of America has come into being and now holds its position of pre-eminence in its branch of the industry.

There is a rich source of incident in all of the operations of such a company. First, there are the "timber cruisers," who locate the desirable tracts of hardwood timber. Each stand of timber must be judged as to accessibility, contour of the land, density and amount of the timber, adaptability for felling the trees and getting out the logs, and from many other angles.

Likewise, in the lumbering operations, there is need for the utmost efficiency in locating the camps, opening up the logging

Digitized by Google

roads and carrying out the work itself. The life of the north woods has been a rich theme for novelist and story-writer. It is a primeval, natural, healthful existence in the open air and to it come men of the sort who prefer to earn their living by their muscle in the big out-of-doors.

Let it not be thought that all of the hardwood which is cut by this company is destined to be used as fuel for the making of pig iron. Hardly that. Hardwood is too valuable to be so used in its entirety and the saw mills turn out a great store of finished lumber each year for the building trade, while the smaller pieces and cuttings go to the blast furnaces.

EVEN then, the purpose of the company to utilize every natural resource is not exhausted. Instead of abandoning the land which has been cut over, it is now used for grazing stock and cattle and sheep ranches are replacing the forest lands. Thus, the land itself is improved and the food supply of the nation increased.

As the lumbering camps and saw mills are the source of one part of the company's raw material supply, so the Yale mine at Bessemer, one which produces an exceptionally high-grade ore, is the other source. Iron ore and hardwood for charcoal are brought together at the four blast furnaces of the company. These are located at Newberry, Manistique and Boyne City, Michigan, and Ashland, Wisconsin. From them the completed pig iron is distributed by vessel and railroad to the foundries of the country.

The chemical plants complete the chain of economy of production and conservation of materials. They dispose of the by-products and wastes of the various processes and make them available for use. It would require long technical descriptions to tell of the modern equipment of the various plants and the labor-saving and safety devices adopted. The Yale mine is reputed to be the finest equipped of any on the Gogebic range. But the same pride in providing equipment extends to all other activities of the company.

As a result of its broad-scale operations and its plan of organization, the Charcoal Iron Company of America has been enabled to furnish each year a uniform quantity of its products. True, it might have made its production figures larger—by rushing operations here and going after quantity output there—but this has not been deemed the best manner of conducting the business in the long run. There would always be the danger of impaired quality of product if rush methods were used and a conservative policy has, therefore, prevailed.

At the present time, with the United States increasingly dependent upon its industries and ever a greater factor in the markets of the world, the fact of the assured supply of this high-grade material for machinery and for other uses requiring the best pig iron for a base is a stabilizing one in its effect upon the country's trade and prosperity.

How the Wire System Facilitates Securities Trading

WHEN we drop into our favorite broker's office and tell him, for an example, to buy 1,000 shares of General Motors or sell ten shares of something else we do not often realize the speed and the size of the machinery which is set in motion to carry out our wishes. Most of the work is carried on behind closed doors but the instant the order is placed in the hands of the telegraph operator there begins one of the prettiest little races against time known to American genius.

The telegraph operator "shoots" the order to the New York office of the same brokerage concern or to the New York correspondent of the Detroit broker, who telephones the order to the floor of the stock exchange, where it is delivered to the floor trader. It is stated that Post & Flagg have an unique device for handling a large volume of incoming orders to the New York exchange which consists of a long bench running lengthwise of a large room around which are seated thirty or forty telegraph operators who receive buying and selling orders from out-of-town offices and correspondents. Running lengthwise along the top of this bench is a swiftly moving leather belt and at the end of the table are several boys who have telephone receivers and transmitters strapped to their bodies. These telephones lead to the floor of the exchange, where another set of boys similarly equipped transmit orders to a number of "runners," who carry the messages to the different posts on the floor of the exchange, where the representatives of the brokerage house actually do the buying and selling.

The handling and execution of orders has become such a fine science with this organization that instances have been known where an order sent in from Detroit was executed and the confirmation wired back within the space of one minute. The telegraph operators sitting around the long bench throw the order slips on to the moving belt, which carries the slips to the boys at the end of the table, who phone the orders to the floor of the exchange where the boys there transmit the orders to the floor traders. By the use of a set of code words for the different stocks and bonds and another code for instructions, the operation is speeded up to a point hardly capable of comprehension. In fact a Detroit brokerage house which does an unusually large amount of business claims in one instance to have sold and received confirmation for the sale of 100 shares of Studebaker recently in the record time of forty seconds.

But this feature of the wire service is only part of the whole. Brokers often have a second or third wire over which the trading operations in unlisted stocks or curb stocks are carried on and over which they often learn of differences in quotations between two markets for the same stock. For example, a Detroit broker is likely to have an operator fitted up with three telephones and two tickers, one from the Detroit Stock Exchange and one from the New York Exchange, and he has his wire key before him over which he is constantly feeling out New York. He will keep advising New York that some stock, for instance Burroughs Adding Machine, is 150 bid 152 asked in Detroit. New York will reply with similar quotations, but occasionally it will happen that New York will come back with a lower ask price than Detroit, which is the opportunity for Detroit to snatch up the stock at New York and dispose of it here at the higher price. The margin may be very small, but the turnover is almost instantaneous and it doesn't take very many turns of this kind to show a profit. This kind of trading is known as "arbitrage."

A ticker service is operated by the Western Union Telegraph Company to all the principal cities in the country. Over the wires come reports of sales on the exchange to the telegraph company's own distributing agency, which in turn redistributes the information to the local subscribers over the well known "tape" nicely housed in a glass case. And the board boys transfer the sales from the tape to the blackboard. Cities in which the Western Union does not distribute the sales through the tickers are supplied with information about sales over the private wires leading from correspondents in the large cities to brokers in the small cities. In cases of this kind the complete information received from New York is not forwarded but only reports on stocks in which the broker in the smaller city is known to be interested.

A private wire from New York may serve four or five brokers, but beyond this number the capacity of one circuit is limited. The business of some houses is so voluminous that several private exclusive circuits are maintained between their principal offices. One Detroit house maintains three exclusive circuits to New York and five to Chicago which are leased from the American Telephone & Telegraph Company, besides having connections with Lansing and Grand Rapids which "tap in" on the Chicago wires. There are several

Quixotic Doctrines Imperil the Grain Industry

What Is Behind the Proposed Legislation Against The Exchanges and What Would Be Its Effect?

By JOSEPH P. GRIFFIN

President of the Chicago Board of Trade

WHEN PRICE DEFLATION swept the world last autumn there was an uproar against the nation's grain exchanges unprecedented in American history.

War time bubbles began to burst. Deflation hit one commodity after another. Some were hit harder than others. Farm commodities were not exempt. But they suffered less proportionately than did many other articles.

Suddenly agricultural America found itself face to face with the puzzling problem of oversupply and under-demand—the reverse of conditions of the war years. Grain prices began tumbling. The inexorable law of supply and demand would not give way. Wheat continued a steady decline from about $2.75 in mid July, 1920, to a low level commensurate with industrial readjustment.

It was the heyday of the organizer, the agitator, the unthinking and ambitious. Over night they began springing up in various parts of the country. They clamored for organization among the farmers. Their loudest shout was against the grain exchanges. These agencies, they declared with great heat, were responsible for price deflation. Louder and louder they shouted their doctrines and daily their army of listeners increased.

They cried for legislation destroying the exchanges. They formed many societies to market grain and took other steps which they claimed would solve the question brought about by world readjustment of commodity prices. They urged farmers to hold their wheat for unreasonably high prices—and brought ruin to many farmers by so doing.

Congress was deluged with bills, some of which, it was admitted during the lengthy public hearings in January and again late in April, would absolutely put an end to existing marketing machinery.

The measure on which serious attention centered was the so-called Capper-Tincher bill. When it was brought up for public consideration in January, the writer and Leslie F. Gates, his predecessor, and numerous others in the grain, banking, milling, elevator and kindred trades appeared before Congress.

Solemnly they outlined the functions of the grain exchanges. They produced expert testimony—from representatives of all phases of the grain trade—proving absolutely that the grain exchanges handle grain with less margin between producer and consumer than is true of any other staple commodity. They proved by the presentation of such evidence that the exchanges were in no way responsible for the slump in grain prices which was world-wide; that "corners" were absolutely impossible under existing conditions; that competent, restricted speculation was necessary in order to provide a futures market, and that without a futures market there could be no hedging, or price insurance facilities for the farmer's grain.

The effect of this testimony later became apparent. The original bill would have abolished the futures market and hence eliminated the economic functions of the exchanges. The last Congress ended before the bill with its vicious provisions could be made a law.

Then the new Congress convened and the entire subject was again up for consideration. But there was an entirely new attitude on the part of the House agricultural committee led by Congressman Tincher, co-author of the bill.

"We are frank to say," declared Mr. Tincher after a presentation of the case of the grain exchanges by the writer, "that in the months of study following January 1 we learned many, many things about grain marketing. That is the reason we are willing to amend this bill. That is the reason that we wish to permit the futures market with its hedging facilities to continue. Grain marketing is a highly technical, scientific subject that requires great thought, and certainly we did not want to destroy the exchanges without even providing a substitute."

It was the first light on the murky horizon. The writer, as official spokesman of the exchanges, thereupon outlined amendments necessary to permit continued existence of the exchanges. Most of these amendments were adopted. But just before the committee reported out the bill Secretary of Agriculture Wallace attached two amendments which, according to the grain trade, would give him almost unlimited power.

The measure besides eliminating so-called indemnity contracts, or "puts" and "calls" (a step which the exchanges had themselves previously taken), throws the exchanges open to co-operative associations, which are permitted to pro-rate their dividends back, in violation of exchange rules; provides a record of each individual trade made by all commission houses, available at all times to the Secretary of Agriculture and gives the Secretary of Agriculture authority to close the exchanges in event a member does not comply with all of the various other provisions of the proposed new law. Despite the restrictions, the grain trade was prepared to try to meet all provisions in event the law was enacted.

JOSEPH P. GRIFFIN

IN VIEW of the agitation in and out of Congress against trading in grain and provisions on the established exchanges, it was felt that an issue of this nature, being for the information of investors, bankers and brokers especially, would not be complete without a discussion of the grain exchange question. In order that the article would bear the stamp of authority, the editors asked Joseph P. Griffin, president of the Chicago Board of Trade and recognized the last several years as spokesman for the grain industry, to write it. Mr. Griffin has very obligingly complied.—The Editor.

Meantime proposed state legislation even more severe assailed the exchanges. In Illinois, for instance, two bills which would entirely eliminate the Chicago Board of Trade, the hub of the world grain business, were introduced. A volley of protest was heard from banks and a dozen other businesses allied with the grain trade. Even agricultural leaders themselves protested against enactment of these bills, on the ground that they would merely drive the Board of Trade out of Chicago and make Milwaukee the world center of the industry. They also took the stand that federal legislation should guide the industry, inasmuch as Congress had spent months studying the entire subject with the best available experts.

The writer in a statement to Congress summarized in a few words a subject upon which volumes have been written when he declared:

"Speculation in grain cannot be abolished so long as the price of grain is subject to fluctuation.

"Hedging is highly beneficial not only to grain dealers but also to all grain producers and consumers.

"There can be no hedging by grain dealers unless persons other than grain dealers are permitted to speculate. To prohibit competent speculation by persons other than grain dealers is merely to compel grain dealers to become speculators.

"Speculation in grain by persons other than grain dealers is useful and beneficial and should not be abolished.

"The evils incident to speculation are largely exaggerted. While

the system may not be perfect, its advantages so far outweigh its deficiencies that attempted prohibition would result in little economic benefit and great economic harm.

"Legislative attempts to suppress speculation have uniformly proved unsuccessful."

The writer and scores of others have pointed to the fact that the real speculator is the man who carries unhedged grain, for a sudden downward price swing brings ruin. The competent bank invariably inquires of a prospective farmer borrower whether his grain is hedged.

In the Chicago market the volume of business is so great that an offer in the pit of a million bushels of grain would cause little fluctuation. But were it not for the Chicago market, such an offer of that amount of grain in, say, the Kansas City market would cause a considerable downward fluctuation. A great volume of business passes through the Chicago exchange. For instance, when a grain merchant in Liverpool buys a cargo of wheat in Australia for shipment to England he immediately sells short an equal amount of grain on the Chicago Board of Trade. This is to insure him against loss in case wheat should decline in price during the months of the voyage. Similarly, when a central west miller buys a few thousand bushels from farmers he sells an equal amount short to insure against a slump in the market before he can make the wheat into flour and sell it. Neither the merchant nor the miller could conduct his business safely without the possibility of "short selling."

Without the exchanges, it has been pointed out before Congress, a few big concerns might soon control prices. Also, without hedging facilities the margin between producer and consumer would greatly increase, for the simple reason that the man carrying the grain would also carry a tremendous risk and would need a larger profit to protect against losses in price swings.

What is the answer to the entire problem? There is a great difference of opinion but the leading authorities appearing at the Congressional hearing late in April said it was education of the farmers as to the true functions of the grain exchanges.

"Not long ago," observed Congressman Tincher in this connection, "a man speaking for the farmers said 'We don't mind reasonable speculation but what we want to get rid of is that miserable hedge.' Which, of course was exactly the opposite of what he meant."

Others declared that when the farmer became familiar with the economic service of the grain exchange he realized that the grain exchange was the best friend he ever had.

Meanwhile organization of the new machinery of the American Farm Bureau Federation, intended to market the grain products of the nation's farmers, goes merrily on. There is a vast difference of opinion as to its merit. On this subject leading grain exchange men have offered no criticism or opposition.

If a better system of marketing grain can be devised we will welcome it. Our objection has been to the proposed destruction of the present machinery, which has been in process of building for 70 years, without even providing a substitute.

Many leading newspapers who are outspoken in their views have charged that the numerous new farmer movements that have sprung up are sponsored by professional organizers whose first acts are to place themselves at the top of a substantial payroll.

A typical editorial from a leading industrial and financial newspaper, under the heading "Lightning Rod Contracts in the Grain Trade" discussed as follows the situation as it existed in May:

"One week ago today it was suggested in this column that the farmers and legislators who are supporting the Lantz bills in the Illinois general assembly make sure they have a workable and efficient substitute for the Chicago Board of Trade, which they seek to destroy. There now appears evidence to indicate that the structure being built to supplement the Board of Trade is quite similar to those foisted upon gullible farmers by professional organizers who have flicked from the farmers of Iowa millions of dollars in the last few years.

"A group of professional exploiters has organized a giant corporation, which is taking advantage of the obvious distress of the farmer to bind him under five-year contract to sell his grain to the corporation and to none other, this corporation reserving the right to sell the grain as it pleases and at whatever price it may. The farmer binds himself to surrender all rights he has to the control of his grain and to pay to the selling corporation commissions set at any figure the corporation desires, and costs not specifically defined, but described as 'running expense.'

"This does not suggest that there is anything reprehensible in the attitude of the farmer or the legislator toward the Board of Trade. Both have been misled by the professional agitator. The farmer forgets what the Board of Trade has done for him in the past, forgets the inordinate profits he made out of grain when it was on the way up, and can remember only his present evil fortune and the losses he sees in the future. He is the natural reaction of desperation, and desperate men usually follow false leaders."

The Best Way to "Dress Up" A Financial Statement for Credit Purposes

The Best Way—the Only Way—Is to Prepare It In Such Manner That It Shows All the Facts Clearly

By GEORGE D. BAILEY
Detroit Manager, Ernst & Ernst

CLOTHES may make the man—but it is a mistake to believe that a financial statement submitted for the purpose of obtaining credit may be materially aided by its outward appearance. The only way to dress up a financial statement is to prepare it in such a manner that it shows all of the facts clearly.

Careful granting of credit requires a complete confidence in the borrower and a complete knowledge of his affairs. As a matter of fact, complete confidence is possible only where there can be a feeling of complete knowledge. The facts disclosed by financial statements are of course only one phase of the granting of credits but each year the importance of financial statements is increasing.

It was not so very long ago that credit was extended almost entirely on the basis of the personal reputation of the borrower; statements occasionally were submitted to banks but other creditors seldom expected to receive them. Gradually, however, credit ceased to be largely between two individuals well known to one another and came to be founded upon facts and upon conditions. The credit man wanted information with which to form his own opinion as to the ability of the borrower to pay. Financial statements were found to give a great deal of this necessary information, and at the present time it is undoubtedly true that credit is more largely influenced by the facts presented in the borrower's financial statement than by any other factor. Perhaps in no other way has the science of credit been developed as rapidly as in the use to which financial statements are put.

Bankers, being the largest dealers in credit, have developed the use of financial statements to the greatest extent. With the growth of the larger banking centers, such as New York and Chicago, financial statements have taken the place of intimate personal contact. The credit files of the larger banks are surprisingly complete and several men are constantly busy keeping these files up to date. There is a financial statement of every borrower and in practically all cases at least one statement each year. Every balance sheet as it comes in is very carefully analyzed. Each new statement is compared with the previous one and with those of other companies in the same line of business. These comparisons are very valuable and often disclose with surprising sharpness dangerous tendencies or weaknesses of organization.

The Federal Reserve Banking system with its power to rediscount the paper of its member banks has injected into the field a creditor who has no direct contact with any of its borrowers. It depends very largely upon financial statements. Member banks therefore are anxious to have available complete financial statements and other financial information to submit to the Federal Reserve Banks.

The year 1920 presented problems in credit which the country had almost forgotten. Every borrower has been asked to furnish information which was never requested before and the country has seen a concerted effort on the part of all creditors actually to force liquidation of loans. Creditors in many cases have brought a pressure to bear upon their customers that in former days would have been very much resented. In such cases financial statements have been of outstanding importance. It is possible of course for many business men to borrow money on statements which contain only the most condensed information. On the other hand the customer who receives the greatest consideration is the one who has built up for many years a complete confidence based upon full disclosure of all conditions. It is a fact that a business man becomes a more desirable customer of a bank the moment he begins the policy of submitting complete and detailed financial statements. If the important facts are presented in the beginning it is oftentimes possible to save a great deal of deliberation and discussion regarding the granting of credit.

The real question in the preparation of a financial statement, therefore, becomes that of determining the facts that are of interest to the creditor and in so presenting those facts that they are easily grasped and not confused by meaningless or irrelevant detail.

In unusual times such as the country is now going through there are many important financial facts which are not necessarily reflected by the trial balance taken from the books of account. They are not definite assets or liabilities but because of their very uncertainty are perhaps of even greater importance than the known items shown on the balance sheet.

The federal government is expecting to collect many hundreds of millions of dollars of additional income and excess profits taxes for the years 1917, 1918, 1919 and 1920. Many concerns have already been called upon to pay large additional assessments and there is at least one case where the Government has taken over the business of the taxpayer in an endeavor to collect a back assessment. At the time of filing the tax returns for the high tax years, businesses very naturally took advantage of any possible favorable construction of the statutes and regulations. Credit men are of course familiar with this general situation and know that many companies are facing large additional assessments which may seriously cripple their finances. The technicalities of the tax law are so numerous that in many cases it is practically impossible to tell what will be the final tax liability of the company. For instance, inventories must be valued on the basis of the lower of cost or market prices. Market is defined in the regulations as being the fair market price prevailing at the close of the fiscal year. The determination of the "fair market price" is oftentimes a matter of judgment and in large companies very small differences of opinion on values might cause large additional tax assessments. A difference of two or three cents a pound on metals or a few cents a yard on textiles may make a difference of hundreds of thousands of dollars in taxes. Companies are being carefully checked up by representatives of the Internal Revenue Bureau, who are recommending the assessment of enormous amounts, the full payment of which is in many cases a physical impossibility. Fortunately many of these recommendations are ridiculous. Nevertheless the creditor is entitled to know as much as possible about the tax situation and some banks are already asking whether or not their customers have been examined by revenue agents, and if so, what additional assessment the agent has recommended. If this amount is large it usually leads to a full discussion of the probable final liability.

Business conditions during the summer of 1920 developed another situation which has a very important bearing upon the financial posi-

SOME of our banker friends have often remarked that it would be a great boon to business if borrowers would only make out financial statements in such form as to show accurately their true condition. Applicants for credit have been known to "dress up" statements through ignorance so as to create either an unwarrantedly favorable or unfavorable picture of their finances. It is our opinion, therefore, that a word on this subject from an authority in the matter of making correct statements will prove of interest to both borrower and credit grantor.—The Editor.

The House of a Thousand BANKS

Erected upon an unshakeable foundation of business integrity, the Bank Equipment and Supply Service of Gregory, Mayer & Thom Company has steadily expanded until it now includes in its clientele one thousand of the leading financial institutions of the middle west.

The Bank Outfitting Division of this service offers the best in Fireproof Safes, Shelving, Filing Cases and Office Furniture. The Supply Service draws upon the extensive facilities of our Printing, Lithographing, Ruling, Loose Leaf and Binding Departments.

The expert advice of our representatives in planning installations of equipment and systems is always at the disposal of our banking clientele. It entails no obligation.

GF Allsteel

The atmosphere of permanence and dignity found in every sound and successful banking institution is supplemented and emphasized by ALLSTEEL Equipment.

Every ALLSTEEL product is absolutely fireproof. It is more economical of space, more attractive and more suggestive of the proper atmosphere than any other type of bank and office equipment.

ALLSTEEL Furniture, Safes, Shelving and Filing Cases come in green, oak and mahogany finishes.

tion of a company. Businesses generally were going at very high speed during the early summer and were being pressed by their customers to increase deliveries. The demand was so insistent that manufacturers, wholesalers and retailers were ordering large quantities of material. Buying ceased almost over night. Deliveries were suspended, although the liability on the purchase contracts still existed. Companies were committed to large purchases which they were unable to accept. To make matters worse, the market prices on basic materials began to fall rapidly. The sale of goods had to be made upon the basis of the new prices. Thus, undelivered purchase contracts had to be liquidated at prices higher than those which could be realized by the buyer in selling to his customers under the new market conditions. During the last twelve months some of the largest corporations in the country have encountered very serious financial difficulty because of their inability to care for their purchase commitments. The creditor therefore is naturally anxious about this situation. He wants to know two things: first, how much of the total amount of purchase contracts must be accepted during the near future, and second, on the basis of present market prices, what is the total loss which the company must take between its contract price and the present market. In asking for additional credit it is important to summarize the commitment situation and to show the result, favorable or otherwise, on the financial statement.

Owing to the uncertainty of present conditions creditors are not only analyzing the present status of the borrower but are also seeking the information which is shown by the company's operating statement. It is important to know whether the company has been making money and, if during the year 1920 it did show a profit, how such profit was determined. If the company showed a loss, perhaps such loss has been due entirely to the shrinkage between the cost of materials and the current market prices. It is many times of interest to know how the company operated, apart from such loss, as in this way the creditor can oftentimes judge as to whether the company is in a position to go ahead making money. The company's overhead expense is also being subjected to scrutiny, and particularly will this be true in statements for 1921, when it will be important to know whether a borrower can make money on a reduced volume of sales. The operating statement will show whether the company is going forward or going backward. It is possible to show this in summarized form directly on the balance sheet of the company by listing the changes in the surplus account through dividends and net earnings or net losses. Such a summary gives much information and saves the creditor considerable speculation, oftentimes erroneous, as to what has happened to the surplus account.

In the actual preparation of the balance sheet the first general principle to be borne in mind is that it is really better to show a conservative, reliable statement, which may show an unfavorable ratio, than to submit a statement apparently better which under the searching tests of the creditor is found to contain items which are unreliable or which do not reflect proper shrinkages. A careful granting of credit demands accurate knowledge and if the creditor must speculate as to further losses he is likely to protect himself by making larger deductions than are nesessary.

Generally speaking, loans are not made to furnish additional permanent capital but are made to finance temporary situations. The creditor expects to be repaid for his loans in the ordinary course of the company's business and does not contemplate liquidating the business and being repaid through the sale of the plant. He therefore gives his first attention to the so-called current assets and current liabilities of the borrower because it is the current assets to which he looks for the repayment of his loan. This general classification should include only those assets which in the ordinary course of business can be liquidated within a reasonable time to care for the liabilities, and usually includes cash, notes and bills receivable due within the year, collectible customers' accounts due currently, and the inventory.

'Cash should include the actual cash on hand and on deposit at the date of the balance sheet. Many concerns have a practice of holding open their cash book for several days after the close of their year, in order to pay all of their liabilities and to show no accounts payable on their balance sheet. This of course is erroneous, as every creditor knows that at the close of the month there are many liabilities which cannot be paid until later. He can assume, therefore, either that all of the liabilities are not on the books or that the cash book has been held open; and if the cash book has been held open he might question as to whether or not any cash received after the close of the year had not also been included. The banker oftentimes compares the cash balance as shown by his records with the amount shown on the company's statement. The cash balance as shown by the bank's records naturally would be larger than that shown by the company records.

Digitized by Google

and if the reverse is found to be true it may create a doubt in the mind of the banker.

Accounts and notes receivable should be segregated to show the amounts actually due from customers and those which may be due from miscellaneous sources. Under the ordinary conditions the customers' accounts can be expected to be liquidated in due course. Special accounts, particularly personal accounts of officers, may be extremely difficult of collection and it may even be that there is no intention to repay these accounts except through dividends. This is particularly true of notes or accounts for capital stock sold to officers and employes. Ample allowance should be made for possible loss in collection of customers' accounts, and under present foreign exchange conditions it is advisable to separate the foreign from the domestic accounts.

The valuation of the merchandise inventory is extremely important in a period of falling commodity prices. The rule which is being generally followed is that each item on the inventory should be valued on the basis of cost or market price, whichever is lower. It is not advisable for articles to be valued at higher than market, on the assumption that market will increase, as it opens up the large question of the fairness of the higher value. It is a primary rule of accounting that all losses shall be taken as soon as known but that profits should never be shown until they have been actually realized by the sale of product. The business man who can answer questions regarding his inventory with the statement that he has priced it on the basis of the best obtainable market price, which may eventually be found too low or too high, has shown himself to be conservative also. With changing market conditions, the question of the salability of the product looms large. All obsolete stock and unsalable goods should be carefully eliminated. Overhead rates are apt to be much higher in periods of low production than can be recovered from the customer and wages may come down to such an extent that adjustment of sales prices must be made. These two factors should be reflected in the inventory valuation, so that the conditions under which the goods must be sold will be reflected in the inventory value. If possible, the merchandise inventory should be classified on the balance sheet to show raw materials, work in process and finished product. Many manufacturers today are holding materials or partly finished work which can be sold only to one customer and the financial situation of the customer becomes of real importance in fixing the inventory valuation. Even if the borrower has on hand sufficient orders for the disposal of all of its inventory, it is advisable to follow the rule of cost or market, whichever is lower, as this gives some margin for the inability of some customers to take their orders and allows for possible adjustments in price. Manufacturing supplies, if included in the inventory, should always be shown separately and should include only those direct supplies which are necessary for the manufacture and disposal of the product. Machine and repair supplies and special equipment should not ordinarily be included in the inventory.

Quickly marketable securities can properly be included in current assets but should be valued on the basis of current market quotations.

Oftentimes a company has other assets which could be converted into cash, if necessary, without detriment to the business but which in the ordinary course of operations would not be so converted. It is becoming more and more customary to classify these assets under a separate heading, the important thing being to show sufficient detail of classification to bring out the kind of assets included. Under this head naturally would follow such items as securities owned on which there is not a ready market or which the company does not intend to sell, personal and officers' accounts, notes for capital stock, etc.

While the valuation of the permanent or plant assets is of secondary interest on a balance sheet for credit purposes, when a statement is used for comparison this item becomes of real importance. The creditor is interested in knowing to what extent the company has acquired new equipment and many creditors carefully compare the plant values of competitive concerns because in reality the value of a plant is based upon the profit that can be made from operating it, and a very costly plant which is unable to make money is oftentimes of comparatively little value.

It is therefore important to give some attention to the manner in which the valuation of permanent assets is presented on the balance sheet. What is the basis of valuation? If it is based upon an appraisal, what is the basis of that appraisal? If such value was establishing during the period of the abnormally high building and machine costs which prevailed during the war period, this fact should be made known by mentioning the date that the appraisal was made. If the balances have been appreciated during the year in accordance with appraisals, the amount of such appreciation should be shown. It is advisable also to separate the permanent assets into the main classifications of land, buildings, machinery, equipment, special tools, special equipment, etc., and if possible, in order to make easy a com-

Investors Will Want This Book

IT covers the birth and the development of the Electric Light and Power Industry

It shows the constant rapid increase in the number of consumers served.

It graphically portrays the growing output and the steadily increasing net revenues of the industry.

It pictures present day uses and points out the broad field still to be occupied.

It shows a ratio of earnings from present business which justifies the purchase of well selected public utility issues by the most conservative investor.

parison with previous years, the amount of the depreciation reserve should also be shown. Such items of intangible value as good will, patents, copyrights, etc., should not be classified as permanent assets but should be shown separately. The valuation of good will, for instance, has a distinct bearing upon the amount of the surplus of the company and the basis of that value should be clearly shown, as at best it is only an estimate.

Deferred assets are really only deferred expenses and should appear on the balance sheet only when it is the company's practice to keep its accounts in detail. As a matter of fact, for credit purposes the deferred expenses might almost as well be eliminated from the balance sheet except for the fact that, where it has been customary to include them, their elimination would have an important bearing upon the operations of the company and give misleading information as to the progress of the business.

Perhaps the first thing that a creditor looks at on a borrower's statement is the amount of the current liabilities. He is interested in the money borrowed from banks, notes given to purchasers and the notes given to individuals. He is also vitally interested in whether or not a real attempt has been made to show on the balance sheet all of the liabilities of the company. The accounts payable for purchases and expenses should include all the money owed by the company for current purchases, including goods in transit. In no case should liabilities be deducted from assets and thus apparently reduce the amount owing by the company. Provision should always be made for the accruing federal tax liability on the earnings of the company to the date of the balance sheet, even though the money does not have to be paid out until later. As previously stated, information as to the possible additional liability of the company for federal taxes should be given in connection with the financial statement.

After all, the one thought to bear in mind in preparing a statement for credit purposes is that the creditor is really, if only temporarily, a partner in the business and as such is entitled to complete information.

There is of course the story of the manufacturer who, on his death bed, called in his son and requested that his pallbearers be selected from the bankers of the city in which he lived.

"All bankers, Father?"

"All bankers," answered Father. "They have carried me most of my life and are entitled to carry me after I am gone."

Where Have the Liberty Bonds Gone?

(*Continued from Page 8*)

1888	1,063,004,895	1899	1,155,320,235
1889	975,939,760	1900	1,107,711,257

1895	932,830,667	1906	964,435,687
1896	955,297,254	1907	878,586,755
1897	986,656,086	1908	938,132,409
1898	1,052,085,492		

It is manifest that there was no free supply of investment money lying around of such size that a billion dollars of government bonds a month could be absorbed without the pinch being felt in some direction, and it was well for the country that we had the Federal Reserve machinery which could expand money and credit with the increase in government indebtedness. From 1890 to 1920 the total loans and investments of all reporting banks in the United States grew from $3,592,000,000 to $30,892,000,000—about eight-fold in thirty years. Unfortunately, figures on total deposits for the period 1913 to 1920 are not obtainable, but it is clear beyond doubt that there was not the same increase in deposits that there was in government indebtedness during this period.

But what we started out to show was some evidence of holders of Liberty bonds passing them on to that much misunderstood and invisible "market." Because there is a place where one can always get cash, many people have assumed that there is something wrong because they are unable to get as much now as the bonds call for at maturity. And many writers having an eye to popular applause have capitalized this widespread misunderstanding. Not long ago Dr. Frank Crane proposed that the United States issue money secured by real estate. Recently a New York engineer offered a plan to stabilize the market value of Liberty bonds by adjusting the interest each six months according to the market value of money. And Prof. Irving Fisher, of Yale, would "stabilize" the gold dollar by a patent process. All of which are schemes to short-cut economic laws. A Liberty bond is a contract to pay a certain sum of money at maturity with interest each six months before due date, and when a man purchased his Liberty bond back in 1917 and 1918 he became bound by that contract. When the Government fails to carry out its end of the agreement it is time to criticize, but we have not heard of any interest payments defaulting as yet. Therefore if I wish to sell my bond I am bound to take for it what my neighbor wishes to pay. Put the question to yourself. If your money is making you 10 per cent in your business, what would you offer for a bond paying 4 per cent?

It is unfortunate in a discussion of this nature that figures showing the extent to which bonds have passed from the original holders to large investors are not available. We know the movement has been heavy, but as an indication of what has been going on there is presented herewith a table showing the total bonds held by different Michigan manufacturing companies at the end of their 1919 fiscal year and at the end of their 1920 fiscal year.

Name of Company.	Holdings at end 1920 Fiscal Year.	Holdings at end 1919 Fiscal Year.
Reo Motor Car Co.	$ 197,796	$ 270,705
Michigan Sugar Co.	892,583	735,083

Difference		$26,840,834

Here is a decrease of $26,840,834 within the space of one year. And the chances are that this is fairly representative of what has been going on in other centers.

Now it is pretty well agreed that large investors desiring tax free securities have bought up a considerable part of the Liberty bonds which have been passing on to the market the last three years, but there is no accurate way to measure the volume of such sales. But the amount of bonds purchased by the Government is a matter of record and the volume of bonds redeemed through purchase is no

Built by Service—for Service

About a score of years ago the Detroit Creamery Company was organized by the consolidation of a few independent milk dealers.

Original capitalization was $125,000 and the first year's sales of all products totaled $200,000. Increasing demands upon the company compelled it to increase its capital to $1,600,000 until in 1920, when Towar's Wayne County Creamery was absorbed and the capital increased to $6,000,000 of which $3,200,000 is now outstanding.

AGGREGATE SALES OF ALL PRODUCTS IN 1920 TOTALED THIRTEEN AND ONE HALF MILLIONS. THIS YEAR'S BUSINESS IS EXPECTED TO REACH TWENTY MILLION DOLLARS.

In serving 150,000 families and 2,000 ice cream dealers, Detroit Creamery Company is the largest institution of its kind in Michigan and the second largest manufacturer of ice cream in the world.

Nine hundred head of fine cattle provide milk for Detroit homes. They are cared for on the company's farm near Mt. Clemens, a farm that grew in ten years from 165 acres to 1,800 acres.

An entire city block is required as a site for the company's main plant, in the heart of Detroit. The newest unit is a six-story building for offices and sales. In addition there are three branches over the city. A large building at Fifth and Pine streets cares for hundreds of horses and the company's fleet of motor trucks.

Thirty-five receiving stations in Michigan are used daily for bringing milk supply from the farms to Detroit. Three plants in Michigan are required for making powdered and condensed milk.

With the addition of the Towar Creamery plant in 1920, there was added to the company's business 150 milk routes, 15 receiving stations, the Towar plant on Henry street, two distributing stations and a large amount of equipment, necessary for a business aggregating $4,000,000 annually.

Detroit Creamery Company is exclusive distributor of the Famous Walker-Gordon Certified milk, produced under the supervision of the Medical Milk Commission of Wayne county. A special laboratory for the testing and preparation of this product is maintained at the main plant.

The refrigeration unit has a capacity of 555 tons for freezing ice cream. It also produces 300 tons of ice daily, which is used for packing ice cream.

How Banks Hav Stood By Business

BACK IN FEBRUARY, when the demand for crepe was highest and when the "buck" was being passed rapidly from wholesaler to retailer and return, the banks came in for a generous blessing because they were supposed to be arbitrarily holding back business. The bolshevik economist—and there are more of them getting space than we realize—told the people that money was tight only because the banks wished to scale down wages in industry by forcing hard times on the people. And another set of misled well-meaners pointed to the improving condition of the Federal Reserve Banks an conclusive proof that the member banks were thereby enabled to "loosen up."

Now every banker who has been borrowing from the Federal Reserve the last three or four years appreciates how much the Reserve Banks have helped to tide over the strained periods, and while the items of bills payable and rediscounts in bank statements have become common occurrences with most banks, yet rare is the banker who desires to see these items contained in his balance sheet. In fact, the departure of showing 10, 20 and even 30 per cent of liabilities in the form of borrowed money would make some of the old school of bankers turn over in their graves.

The existence of borrowed money items in bank statements, furthermore, got so common during 1920 that in one instance which came to notice a depositor questioned the condition of a certain up-state bank because it did not show any borrowed money.

When the criticism of the banks was at its highest we published

STRAIGHT LINE METHODS

Courage in Business

All modern industrial and mercantile expansion depends upon courage. It explains progress. It determines the limits of individual success. It is the physical expression of confidence and belief.

Business moves forward only so far as it is led by men with the vision of new conditions, new ideas, new forces, new methods—*and the courage to put them through.*

Business weaklings are left behind at the end of every period of inflation. Courage is not governed by conditions; it controls conditions. It not only recognizes, but eliminates, weak organization, mistakes, inefficiency.

Courage is inspired by knowledge. Knowledge dispels fear. Knowledge of your business—timely and dependable Facts and Figures from every department—points out weakness and waste; while knowledge of better methods, *with courage,* eliminates them.

a story entitled "Borrower vs. Banker" (issue of February 26, 1921) and included therein a set of graphs showing how the clearing house banks of Detroit, collectively, had fared during 1919 and 1920 in the matter of deposits, loans and borrowed money. We now present a revision of those graphs in which the relation between total deposits and total investments is clearly demonstrated from January 1, 1919, to May 19, 1921. This set of graphs establishes an alibi for the banks more conclusively than hours of oratory or reams of discussion.

Please note the two upper graphs, total deposits and total investments. It will be observed that total deposits January 1, 1919, were about $37,000,000 in excess of total loans and investments. Now by following the two graphs across the page to the right it is clear that all during 1919 there was a reasonable margin between deposits and loans notwithstanding that both were mounting rapidly. At the same time please examine the graph at the bottom of the sketch entitled "Borrowed Money Obligations." It will be observed that the aggregate of these increased almost in sympathy with the increases in direct loans and deposits.

But along about February 1, 1920, things began to get out of gear. The continued rise in deposits changed to a series of small ups and downs all during the summer of 1920, while loans and investments (dotted line) did not follow suit except during March and April. During July and August total loans and investments increased again without a corresponding gain in total deposits, until by September 1 the loan item was more than $20,000,000 in excess of deposits. And, as the borrowed money graph shows at the bottom of the sketch, the difference had to be made up by rediscounting paper and borrowing money on collateral. An approximate statement of the clearing house banks collectively on September 3 would be as follows:

ASSETS.		LIABILITIES.	
Loans and investments	$473,000,000	Deposits	$451,000,000
Banking house and other assets	25,000,000	Capital and undivided profits	57,000,000
Reserves	70,000,000	Borrowed money	60,000,000
	$568,000,000		$568,000,000

Manifestly this is not an exhibit which permitted of much argument in favor of the "loosening up" idea and it is particularly unfortunate that the layman could not have looked upon the situation with the same equanimity that he regarded his own finances. The bankers have their sins, the Lord knows, but here was a case where they went the limit to protect the banks of the city, and all they got for it from many people was abuse and complaint. It is no wonder many of them get into the habit of assuming that well known ice-house attitude which makes the chills run up and down a borrower's back.

Looking further along the chart, the period from September 1, 1920, down to date has been one of a constantly widening gulf between deposits and loans, the breach widening from $22,000,000 last September to $49,000,000 May 1. Borrowed money totals while this was going on did not score a corresponding drop but instead went up April 1 to the highest point during the period—$65,000,000. But things began to right themselves in April, and by May 5 there had been a $25,000,000 gain in deposits and a still further liquidation in loans. And borrowed money went down to $43,000,000 for the first time since April, 1920. The chart also shows that during May commercial deposits regained part of their former position above savings deposits, the graphs of commercial deposits and savings deposits showing that the change took place along near May 1. What is needed, however, before there comes any real cause for shouting it to see the loan and investment graph drop down below deposits and to see a continued decrease in the borrowed money graph until the relation between deposits, loans and borrowed money becomes more nearly in the relation shown January 1, 1919, at the extreme left hand side of the sketch. It might not be amiss also to refer again to the relation between the banks and the Federal Reserve System and to point out that strength of the latter is not a conclusive proof of ability of the former to "loosen up." We should all be pleased to note that the Federal Reserve System is holding more than 50 per cent of gold against its liabilities, but should bear in mind that because the Reserve System is in sound shape, that does not mean that the banks are any better able to make loans.

The time will come some day when business men will study bank statistics sufficiently to understand why banks do not "loosen up" in periods like the one through which we are passing. If the same publicity had been given to information about the relation of deposits to loans and borrowed money of the individual banks as has been given to the feature of gold reserve ratio of the Federal Reserve Banks, this lack of understanding would have been largely cured. That the lack is widespread is evidenced by the remarks of our own estimable Prof. David Friday before the Detroit Real Estate Board, recently, when he called attention to the rising reserve ratio of the Reserve Banks as an indication that the banks should again open their money chests to new loans for building. The Federal Reserve Banks' relation to the ordinary banks is exactly that of the ordinary bank to its customer. I may be dealing with a bank that has a 50 per cent reserve but if I personally have not accumulated sufficient deposits therein to permit of my spending money, the strength of my bank is of no avail. And, furthermore, if I have tied myself up so that good judgment does not entitle me to more loans from my bank, the strength of the latter again is of no avail to me.

It should be pointed out further that the gold ratio of the Reserve Banks has risen more because of gold importations from abroad than from natural causes in this country. Between August 7, 1920, and May 18, 1921, the Reserve Banks themselves were contracting themselves. Total assets on the first date were $6,083,000,000 and on the latter date $5,490,000,000, a shrinkage of $693,000,000. But returning again to the Detroit situation, it will be interesting indeed to watch the course of these figures of loans and deposits and borrowed money for the next six months, for if the present rate of decrease is maintained there should be a return to normal relation before a great while. And when that relation is accomplished the banks will "loosen up" agreeably. But not before.

A Word About Covert Act Road Bonds

(*Continued from Page 33*)

contracts are let for the improvements, bonds are issued to anticipate the collection of the assessments. These bonds are the obligations of the county, the townships and the property assessed in proportion to the determined benefits derived from the improvements. Taxes are then collected in the regular way and it is provided by law that if any of the taxes are returned delinquent, the county shall pay the same so long as it is not obligated in the aggregate by other debts to more than 2 per cent of its assessed valuation.

This has been construed to refer to the taxes of the property owners' portion only. The bonds are frequently issued in three parts: the county portion, the township portion and the district portion. So long as the aggregate county debt is under 3 per cent of assessed valuation the county and district portions are classed as county obligation and the township portion as township obligation.

But the fact that the county road commission has the power to levy taxes on counties and townships (and now on cities and villages under recent amendments) without the specific authority of such municipalities as expressed by a vote of the electors has created an innovation in municipal obligations the constitutionality of which a number of bond attorneys have doubted. However, the supreme court in two decisions has upheld the constitutionality of the law and while it has not covered all possible constitutional objections in these decisions it is the opinion of highly respected legal talent that the supreme court would be slow in reversing the trend of these and other decisions upholding the right of the state to legislate regarding road matters as concerning the entire state.

On the other hand, the fact that the law has not been entirely judicated, that the bonds are not approved by the voters in the established way, that the assessments may be paid before maturity while the bonds cannot be called for payment before due, and that in the present market the requirement of the statute that the bonds must be sold at par necessitates resorting to sundry evasions, some of which may not be strictly legal, all tends to detract from the desirability of the bonds as a strictly high grade municipal obligation.

But it is quite generally admitted that the security behind the bonds is usually very ample, the yield with the tax-exempt features is attractive and the tendency to mature the same within the estimated life of the improvement gives the bonds when considered by themselves a fairly satisfactory rating among the investment offerings today.

EARNINGS MICHIGAN BANKS YEAR ENDED JUNE 30, 1920

Gross earnings	$47,807,175
Losses, bad debts, premiums charged off	2,240,058
Expenses, interest and taxes	34,066,804
Net profits	$11,260,319
Out of which total dividends of $5,906,321 were declared.	
Total average capital for above period	$50,987,560
Total average surplus for above period	35,911,070
Total average capital and surplus	$86,898,630
Upon which the net profits were equivalent to	12.96%
And upon which dividends were paid equivalent to	6.79%
Total average undivided profits for above period	$11,507,191
Total average deposits for above period	$43,748,750
Upon which net profits were equivalent to	1.33%

Where Have Liberty Bonds Gone?

(Continued from Page 78)

small affair. Up to June 30, 1920, the Government had purchased the following amounts at prices shown:

Issue.	Par Value.	Price Paid.
First Liberty conv. 4s and 4¼s	$ 36,912,000	$ 34,722,342
Second Liberty conv. 4s and 4¼s due 27-42	478,688,000	452,358,913
Third Liberty 4¼s due 1928	433,308,100	414,067,698
Fourth Liberty 4¼s due 1933-38	566,987,050	530,548,515
Victory 4¾s and 3¾s due 22-23	249,001,000	245,868,740
Total—Par value	$1,764,896,150	$1,677,566,210
Total—Paid therefor	1,677,566,210	
Saving to Government	$ 87,329,940	

In this instance alone we note that the Government bought up bonds to the par value of one and three-quarters billions out of a total outstanding of about twenty billions; or about 8.8 per cent of the total bonds outstanding have been purchased by the Government. It is not likely that private investors have bought up an equal amount either because of the tax free feature or the attractiveness of the yield at low prices so that one may readily imagine what the prices of the Liberty bonds would have been without Government support of the market.

PUBLIC DEBT OF THE UNITED STATES AS OF APRIL 30, 1921

PRELIMINARY STATEMENT

Total gross debt April 30		$23,995,564,776
Total gross debt before deduction of the balance held by the Treasurer free of current obligations, and without any deduction on account of obligations of foreign governments or other investments, was as follows:		
Bonds—		
Consols of 1930	$ 599,724,050	
Loan of 1925	118,489,900	
Panama's of 1916-1918	48,954,180	
Panama's of 1918-1938	25,847,400	
Panama's of 1961	50,000,000	
Canveron Bonds	28,394,500	
Postal Savings Bonds	10,718,240	
	$ 883,728,270	
First Liberty Loan	$1,952,299,850	
Second Liberty Loan	3,318,518,900	
Third Liberty Loan	3,644,456,250	
Fourth Liberty Loan	6,359,100,900	
	15,274,375,800	
Total bonds		$16,158,104,070
Notes—		
Victory Liberty Loan		$ 4,069,282,655
Treasury Certificates—		
Tax	$1,643,979,000	
Loan	905,519,000	
Pittman Act	239,375,000	
Special Issues	32,854,450	
	$ 2,819,788,450	
War Savings Securities, net cash receipts	713,879,170	
Total interest-bearing debt		$23,761,024,345
Debt on which interest has ceased		5,869,260
Non-interest bearing debt		228,671,270
Total gross debt		$23,995,564,776

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Michigan Bankers in Convention

State Association Holds Its Thirty-fifth Annual Meeting in Detroit; A Review of the Discussions

By PHIL S. HANNA

MICHIGAN BANKERS, in their thirty-fifth annual convention, got down to business Monday afternoon in the west ball room of the Hotel Statler after half a day of participation in official proceedings and about a whole day of unofficial gatherings. As was expected, many of the delegates from upstate drove down Saturday and Sunday and those who came in this wise spent the greater part of Sunday in sightseeing. But at 9:30 Monday morning Mrs. H. M. Brown, secretary of the Michigan Bankers' Association, set up her official registration table in the ballroom lobby and began to hand out official badges to those who came to register. She also presented each delegate with souvenirs from various Detroit banks, the First & Old Detroit National giving a bronze ash tray, the Dime Savings a leather note book and the Peoples State a paper weight with an etched picture of Lincoln on it.

It began to appear early during the registration that estimates of attendance were far too low and by 10:30 the number had passed 440, and it was stated at noon that fully 700 persons, including the guests of the Association, had passed the registration desk.

There was an inviting array of entertainment features. Automobiles took the ladies to the Country Club for a reception and luncheon and some of the men stole off to play golf. But in the main the morning was spent in handshaking and renewing of acquaintances.

The Opening Session

There were very few vacant seats when the first session of the convention was called to order by President Staley. Following the invocation by Dr. Joseph A. Vance, Mayor Couzens extended a warm welcome to the bankers. He said humorously that the reputation of Detroit as a convention city was no doubt due largely to the generosity of the police commissioner and implied that perhaps the said commissioner had sometimes been color blind as to highhalls. But his message to the bankers was that Detroit wanted to co-operate with the rest of the state in all things, although he recognized that perhaps the country banker would not agree with him regarding municipal ownership.

Gerrit J. Diekema, Holland, responded for the bankers and showered his inimitable friendly spirit upon his hearers. He illustrated some of his points by anecdotes, of which there were too few, and impressed the gathering most forcefully with his conception of what the Association stands for, namely, "to develop the highest type of business integrity known the world over," and that the convention as an institution had for its object to inspire members to the most generous co-operation, not for private gain but for the broad benefits gained thereby for the entire state.

Following Mr. Diekema, President Staley delivered his annual address. In opening he called attention to his desire to make the sessions of the convention snappy and to inject more conciseness into them, and referred to the change from a three day session to one covering two days. His citations of what the banks had been through, the year during which he has been president, brought home to every one a realization of how much the fraternity has now to be thankful for, and while there are still many hard jobs ahead he pointed out that difficulties were now by custom being quietly solved. In reviewing the events of the year Mr. Staley pointed to the peak of inflation in March, 1920; to the overtaking of demand by production, with the consequent "buyers' strike" and high inventories, and made the significant statement that "the four months ending March, 1921, were without doubt the most severe in financial history." In his opinion it was most noteworthy that this period was passed with comparatively few business fatalities.

"At no time was the financial fabric of the country in jeopardy and at no time were we even near the limit of Federal Reserve Bank resources," said Mr. Staley, "the banks being entitled to the credit for such a small number of failures and the Federal Reserve system being entitled to the generous thanks of the country for the supply of funds."

The president's address in full was as follows:

"Assembling in convention today for the thirty-fifth consecutive year, the bankers of Michigan have much for which to be thankful. Into the last twelve months have been crowded many and varied and great problems, which have been bravely met and quietly solved by the bankers of this state and nation. Other problems, however, will continue to confront us.

"One year ago we were in the midst, and nearing the climax of, a frenzied, feverish activity in industry, commerce and trade, which was taxing the resources of our banks. We were in the midst of the mad and extravagant buyers' movement, which developed as an aftermath of the war, whose appeal had been for economy and thrift. As a result, the growing demands on the banks of the country, which had expanded bank loans over five billion dollars during the eighteen months after the armistice, called forth a mild warning from the Federal Reserve Board as early as November, 1919. This warning was again sounded by marking up the discount rate in February, in April and finally in June of last year. This period was marked by the exercise of caution by our bankers, but, too, in a spirit of helpfulness to every legitimate demand of trade and industry.

"Inflation in prices and wages, it now develops, reached its peak in March, 1920, but not until November was there evidence of any possibility of a precipitate decline. It was then that business came to a realization that production had overtaken demand, that in fact there had come a sudden revulsion to high prices by the buying public, which settled itself quickly and for a period of several months into a buyers' strike, a period marked by high inventories and heavy obligations in all lines of business.

"Perhaps, measured by what preceded it, business in America has never experienced a depression more severe than during the four months ending in March, and it may be said, too, that business acquitted itself well, for never have we known a depression paralleling this marked by so few failures or real business distress. That the banks deserve much of the credit for this is true, but to the Federal Reserve system must go the entire credit for the supply of funds which made it possible for the banks to carry their customers and to give added help where needed.

"Little attention need be given the occasional criticism of the Federal Reserve Board for its responsibility in checking the inflation and thereby bringing about business reaction. We were fortunate indeed that there was an agency powerful enough to do this very thing, and at the same time with resources sufficient amply to protect the situation so brought about. The conditions prevailing during those months of expansion were generally recognized by business men and bankers as unsound, and eventually leading to disaster if not checked, and today we fully realize the wisdom of the Federal Reserve Board's policy. Notwithstanding the action of that Board, it must be understood that at no time has our banking system been in jeopardy. We have never yet even approached the limit of the possibilities of that system. We have but to note the course of the Bank of England's reserves to realize the vast strength of our own system, even at the peak of the demands upon it this past year.

A Comparison of Reserves

"Like the Federal Reserve Banks here, the Bank of England is the great reservoir of bank reserves in England. Previous to the war her gold reserve but occasionally had gone below 50 per cent, and the average for the decade ending in 1910 was 53 per cent. In 1910 this percentage began a decline, which continued until it had reached 7.3 per cent late in 1920. It has since recovered to 14 per cent. The strength of the Bank of England, however, has never been questioned, and it is recognized today relatively as impregnable as at any period in its history.

"The Bank of France has in no sense altered its position in the financial structure of France, yet its gold reserves have dropped from 62 per cent in 1913 to 9 per cent in December last. Even the German Reichsbank maintains its position of power in Germany, though its reserves have declined from 42 per cent in 1913 to 1.2 per cent in December, 1920.

Digitized by Google

"When we recall that the low point in the gold reserves of the Federal Reserve Banks reached in May, 1920, was 42.5 per cent, we understand by comparison the strength of our bank position at that time. By the contraction of $584,000,000 in the Federal Reserve note issues since January 1, and the addition of more than $200,000,000 to the gold fund, this percentage has been increased to 57.6 per cent and has led to the suggestion from the Federal Reserve Board that liquidation has so far run its course as to warrant a constructive upward turn in business activity. We are on a new basis now, however, and we recognize that underlying the business conditions more sound today than at any period since our entry into the war. Sanity in all activities is once more dominant and the revival in trade and industry which we are now experiencing is marked by the good sense and sound judgment which are basic characteristics of American business but which for two years after the armistice were submerged in a wild orgy of extravagant ideas and actions. In the very fact that we are on a sound basis today lies our great hope of the future. Our problems are many, but in rebuilding our house the one essential is a firm foundation. However drastic may have been our experience during recent months, we know that we have passed the low point and whatever may be our problems their solution is clearer and nearer today.

"The most encouraging sign of these times is the overwhelming mandate of conservatism given at the polls in November. That this reflects the growing opinion of all civilized peoples may be accepted. The battle of business has ceased. Strife is giving way to a greater mutual confidence. We are a great commercial nation and our people are beginning to realize that our interests, individual and collective, are better conserved by helping to build up, rather than tear down, this great business structure.

"Of our national problems as they affect the general business situation, the questions of taxation, the tariff and transportation are the most important and far reaching. The best minds of the country are now directed at their intelligent solution. These questions are all, directly or indirectly, related to finance, but a question which supersedes all these as it affects our finances, and in the relative importance of its immediate need is a constructive plan for refunding the national debt. This should take the form of a long time bond at a rate of interest to conform to the present market, callable at a slight premium after a term of years. Should there be a marked decrease in interest rates during the next few years, the callable feature would give the Government opportunity to take advantage of it. The immediate refunding into bonds of the floating debt and one-half billions of short term Certificates of Indebtedness would soon release that amount of current funds, which these certificates now absorb. The banks purchased government short term certificates during the war but the funds were immediately turned back into trade and industry. The present floating debt of the Government is a war debt, and having been continuously renewed for two and one-half years, must be classed today as a fixed loan. Admitting that the recent business depression resulted directly from a strained credit position, accentuated by insistent government demands on our banks, we can doubt the rebound which would result by removing the Government as a current borrower? The refunding next in order and without delay of the Victory notes due in May, 1923, would remove a problem of refinancing which is bound otherwise to have a restrictive influence on money and credit during the next two years. While it would be the course of wise freedom to refund them into the same issue all succeeding maturities of Liberty loan bonds, and these issues are now selling at par, it is entirely possible that with the current debt and Victory notes out of the way, the credit situation might be so relieved as automatically to restore Liberty loan bonds to par.

"The financial problem next in importance is economy in public and private life. Few of us realize the tremendous power within our grasp if we but used the most common sense rules in our expenditures. Our domestic trade in 1920 is estimated at ninety-three billion dollars, of which 12 per cent, or eleven billion, was spent in what we would all admit to be extravagance. Suppose we cut in two these purchases in no sense essential, we would thereby save an amount sufficient in 60 months to wipe out the entire national debt. The surest way to approach this result is through the moral effect of a drastic cut in public expenditures. The new administration is committed to this course, and let us hope that those directing our destinies at Washington will have the courage and foresight to carry economy into the government expenditures to such a degree as to leave in our minds no doubt of its result. Let us not forget that the public revulsion to high prices is directed just as strongly at government extravagance. We all contribute our share toward the expense of government, and our people have a right to expect a reasonable degree of prudence in the appropriation of public funds, especially during this period of readjustment from those years of war waste. The early establishment of a budget system is the first important move in this direction. The rapid divorce of government from business, except in a regulatory way, and the injection of more sound business methods in government, are urgently needed. A broad program of world disarmament and a definite policy of refunding the war debt, to be met by future generations, would eliminate one billion dollars from the appropriations of the coming year. While expenditure of four billion dollars, as forecast by Congress, for the year ending June 30, 1922, reflects a tremendous decrease from that of 1920, when over seven billion dollars was levied in taxes, or even the current year, with five and one-half billions in appropriations, it is yet vastly too large. Business has carried and will continue to carry 80 per cent of this tax load. The prosperity of our people depends on the activity of industry, trade and

The Week in the Motor Industry

Price Reductions Generally Fail to Increase Sales; Ford Motor Company Said to Be Operating at Capacity

By MARC BRAUN

THE END of price cutting among the automobile manufacturers is not yet in sight. While there may be a temporary slowing-up in such announcements, it is likely that quite a few more will be made before the end of the month, as guaranteed prices of some of the makers expire June 30 or by July 15. A number of manufacturers again have announced that they have no reductions in mind, at least not until late in the year or the end of 1921. Some of them, however, added that should something unforseen happen and make a price reduction necessary in the meantime, dealers as well as purchasers will be protected by a refund.

Taking the business as a whole, it does not appear from what has been learned from manufacturers, dealers and prospective purchasers that the price slashing movement started some eight weeks ago has greatly helped sales. Of course, as is usually the case, there are exceptions, and some cars have been selling more rapidly—at least according to statements made by officials of either manufacturing or sales concerns. On the other hand, it is also known by many who are in a position to know that in a good many instances the expected increase in sales has not materialized.

Somewhat Demoralizing

There is ample evidence that the public in general has found the action of the manufacturers rather demoralizing, because it was started in the midst of the selling season. As was stated previously in this publication, the reduction of prices should have been delayed until July or August, which would have been at the end of the selling season. However, inasmuch as conditions are not alike with any two manufacturing concerns, it was a case with many of being guided strictly by what they thought best for their own interests.

At a recent meeting of the board of directors of the Jordan Motor Car Company, Cleveland, it was announced that Jordan dealers had asked for more than 600 cars between May 1 and 28 and that they took orders for more than 800 cars for immediate delivery. Officials announced that advance June orders covered by deposits in the hands of dealers were as follows from seven of the more important distributors: New York, 75; St. Louis, 30; Philadelphia, 102; Chicago, 75; Cleveland, 85; Pittsburgh, 35; Boston, 50.

A company which is not on the list of those which recently reduced prices is the Packard Motor Car Company, Detroit. It is said that its business as a whole is satisfactory. So far as the Detroit district is concerned the Packard Detroit Branch reports sales of $750,000 of cars during April and May—111 deliveries in April and 105 in May. Concerning the business, General Manager H. W. Peters says:

"Business kept up surprisingly well during the month of May, and while the May business is not quite up to that of April, the total is well in excess of $300,000. This gives us a grand total of three-quarters of a million for the last two months.

"This is especially gratifying when the price-cutting war is taken into consideration. The price cuts, coming when they did, just as the industry was coming out of the depression, and right at the peak of the automobile demand, was probably the most demoralizing one the business has ever experienced. To keep going steadily through it all, as we have done, is a popular indorsement of our merchandising policy.

"Packard prices have always been as low as good business allowed them to be. Prices and demand should work inversely. As the demand increases, lower prices are made possible, for large production means economical manufacture. Therefore, last fall upon an anticipated large production of the Single Six, the price was reduced from $3,640 to $2,975. Incidentally we delivered more Single Sixes last month than any month to date.

"The new trucks continue to move slowly. During May thirteen new units were delivered but indications are for a steady pick-up in the truck business for June."

The following telegram signed by A. B. C. Hardy, president and general manager of the Olds Motor Works, Lansing, has been sent to Oldsmobile distributors: "Any reports, rumors or newspaper stories that have predicted a reduction of Oldsmobile prices have no authority and can only have been inspired by those without information or who have sought to injure Oldsmobile business. Oldsmobile 43A and 47 prices were predicated upon material and labor costs even lower than present price levels, and bear out every claim we have made to the public that they represent values nowhere even approached in the present market."

It has been announced by President A. R. Erskine, of the Studebaker Corporation, Detroit and South Bend, Ind., that during April 6,559 cars were sold and during May 7,400, a total of 13,989, while in 1920 during the corresponding two months only 6,626 cars were sold. There were recently unfilled orders on hand for about 7,000 cars. In the course of his statement Mr. Erskine says: "In the first quarter of the year we did 13 per cent of the total automobile business in the country, and in this quarter are doing 15 per cent of the total business, excluding the Ford Motor Company. We are today making price adjustments, based on lower costs, in addition to reductions made eight months ago, and anticipate no difficulty in continuing record earnings throughout this year. Reductions in the prices of motor cars, which are now occurring, are a good thing for the industry, because they will assist in the restoration of confidence and stability. Prices cannot return to pre-war levels because wages will not and should not; and quality standards are higher."

—Butterfield in the Monroe Commercial

GET BUSY!

A Ford Statement

For several weeks rumors have been heard about things the Ford Motor Company isn't doing or wasn't going to do. One day it was said that men by the hundreds were being laid off; the next day it was reported that output had been reduced 50 per cent; still another day it was whispered that the plant was going to close the next week for an indefinite period. As a matter of fact all that is being said about Ford's doings is known at the Ford headquarters and whatever is being said does not seem to worry the Ford organization in the least.

"Why should we bother about all that is willingly or unwillingly said about us," asked a company official. "We know that much is being circulated by people who seem to have only one object—to hurt the Ford business. However, as the records show, these rumormongers do not hurt us a bit. The only thing that hurts us is our own inability to produce all the cars our dealers ask.

"Perhaps the best way to answer all these stories is the fact that our production for June is 100,000 cars, the same number as for May, which is more than 4,000 cars per day, our maximum factory and assembly plant output.

"We are not in a position to advise what the production figures will be for subsequent months, as definite schedules are not established more than thirty days in advance. Our branches and dealers, however, asked to be supplied with a considerably greater number of cars than the 100,000 scheduled for this month, so that Ford output at present is limited not by orders but by manufacturing facilities.

"Since May 12, when we broke this year's single day output—4,092 cars—we have gone up in production to more than 4,100 cars a day, and last Friday, May 27, we reached an output of 4,239.

"Of course none of us know what several months in the future will bring, but here at

—Darling in the New York Tribune

Getting Mad at Her Because She Doesn't Give as Much Milk as She Did Two Years Ago Isn't Going to Help the Supply Any

Digitized by Google

the Ford company we are looking ahead, not behind."

It has been officially announced by George C. Hubbs, vice president and general manager of the Grant Motor Car Corporation, Cleveland, that there has been no shutdown of the plant.

"Our business, like that in many other plants, is not as good as it was a few weeks ago, but we shipped twenty-one cars Saturday and so far as we can see now we shall continue to operate, as we are getting orders," said Mr. Hubbs. The Grant company has been turning out an average of 25 cars a day up to very recently.

Announcement was made by General Manager W. L. Day, of the General Motors Truck Company, Pontiac, that beginning Monday of this week, the plant would be operated as usual. For a week there was a temporary cessation of activities in the machine and assembly departments, but there is no truth in the rumor that the plant will be closed.

Activities at the plant of the Oakland Motor Car Company, Pontiac, continue at a good rate, and according to General Manager George H. Hannum the production of 100 cars a day was expected to be an accomplished fact during the week.

The Kissel Motor Car Company, Hartford, Wis., has reduced the price of four of its custom built models $500. Old and new prices are as follows:

Model	New Prices	Old Prices	Reduction
Standard Touring	$2,775	$3,475	$700
Standard Tourster	2,975	3,475	500
Standard Coupe	3,775	4,275	500
Standard Sedan	3,775	4,275	500

Since June 6 lower prices are in force on the Elgin, made by the Elgin Motor Car Corporation, Argo, Ill. The comparison:

Model	New Prices	Old Prices	Reduction
5-Passenger Touring	$1,495	$1,775	$280
4-Passenger Scout	1,595	1,895	280
5-Passenger Sedan	2,295	2,795	400
4-Passenger Coupe	2,395	2,795	400

The Hudson Motor Car Company, Detroit, has reduced prices $150 effective June 2, as follows:

Model	New Prices	Old Prices	Reduction
7-pass. phaeton	$2,250	$2,400	$150
4-pass. phaeton	2,250	2,400	150
Cabriolet	2,850	3,000	150
Coupe	3,125	3,275	150
Sedan	3,250	3,400	150
Touring limousine	3,475	3,625	150
Limousine	3,850	4,000	150

Effective since June 2 the prices of the Essex cars, made by Essex Motors, Inc., Detroit, are $150 lower. The new price schedule is as follows:

Model	New Prices	Old Prices	Reduction
2-pass. touring	$1,445	$1,595	$150
2-pass. roadster	1,445	1,595	150
2-pass. cabriolet	1,950	2,100	150
5-pass. sedan	2,360	2,450	100

In the case of the Hudson and Essex this is the second price cut since last fall, the total reduction on the Hudson ranging from $350 to $600; on Essex $350.

New lower prices on the Studebaker cars were announced last week by the Studebaker Corporation, Detroit and South Bend, Ind., the reductions ranging from $115 to $200. Prices now are as follows:

Light Six Models	New Prices	Old Prices	Reduction
2-pass. roadster	$1,300	.....	.....
Touring	1,335	$1,490	$155
Coupe	1,695	1,850	155
Sedan	1,995	2,150	155
Special Six Models			
2-pass. roadster	1,585	1,750	165
Touring	1,645	1,750	105
Coupe	2,450	2,650	200
Sedan	2,500	2,700	200
Six-Six Models			
7-pass. touring	1,995	2,110	115
Coupe	2,850	3,050	200
Sedan	2,950	3,150	200

The Paige-Detroit Motor Car Company, Detroit, announced price reductions ranging from $20 to $160, effective June 7. The old and new schedules are as follows:

Model 6-62	New Prices	Old Prices	Reduction
5-Passenger Touring	$1,635	$1,795	$160
5-Passenger Roadster	1,635	1,795	160
4-Passenger Sport	1,925	2,015	90
4-Passenger Coupe	2,450	2,670	150
5-Passenger Sedan	2,570	2,720	150
Model 6-66			
7-Passenger Touring	2,875	2,895	20
4-Passenger Sport	2,975	2,995	20
4-Passenger Coupe	3,255	3,275	20
7-Passenger Sedan	3,320	3,850	20
Limousine	4,020	.....	.....
Daytona Roadster	3,295	.....	.....

Paint, Oil & Varnish Club Hears of Hoover's Program

Herbert Hoover's program for reorganizing the Department of Commerce in a manner that will make it an efficient point of contact between the federal government and the business structure of the country without being inquisitorial in its nature, has been presented to Detroit business men by one of the men who will assist in the work. S. Marshall Evans, Chicago, president of the National Paint, Oil & Varnish Association, as guest of the Detroit Paint, Oil & Varnish Club at its annual meeting Tuesday evening at the Fort Icewcraft Country Club, carried the Secretary's story as revealed in a conference with business leaders only a few days ago.

Mr. Hoover's idea, Mr. Evans explained, was to assist in the creation of sections that would gauge accurately consumption and demand in the country's manufacture and production in all branches, and also the capacity of output, with the idea of co-ordinating so that the element of uncertainty that has prevailed in all industries might be eliminated and a fresh start on a sounder and more accurate basis be possible.

Mr. Evans said that when Hoover assumed his job in the Department of Commerce he found more than 400 bureaus whose duties overlapped and whose efficiency was at low ebb. This condition is being rapidly dissolved and it is hoped to so reorganize that is meeting with the demands of the country. It will not be long, according to Mr. Evans, before the results of this policy will be seen throughout the entire structure of American business.

George V. Horgan, of New York, accompanied Mr. Evans to Detroit and spoke of the rehabilitation of the paint industry of America in its period of reconstruction. Other speakers were: Otis M. Hoard, Chicago, editor of the Paint, Oil & Chemical Review; H. S. Bonnell, Detroit Graphite Company; William H. Carnegie, Berry Brothers; R. A. Plum, of the Truscon Laboratories, and Alfred Fischer, of the Michigan Manufacturer, all of Detroit.

At this annual election of the Detroit club the following were chosen: President, C. C. Boone; vice-president, Michael McNamara; treasurer, F. J. Holtz; secretary, L. E. Phelan, directors, Charles L. Forzey, Kirke W. Conner and H. J. Woodlock; board of control, H. S. Boutell; delegates to the national convention at Atlantic City in October, E. R. Hoyt, H. J. Woodlock, William Search and S. S. Thomas; alternates K. W. Connor, Jos. A. Miller, John Zeph and H. R. Lott.

The Ford Motor Company, Detroit, rather unexpectedly announced a price reduction taking effect Tuesday, June 7, this being the second cut since September, 1920, when the company started the general movement. The latest reductions range from $15 to $50.

In the course of the announcement the company states that the action was made possible by a number of factors, among which are the greater demand and larger sales of Ford cars, the greater efficiency in operating the plant, etc.

"During May we produced 101,424 Ford cars and trucks in the United States alone," says the statement, "and this was the biggest month in the history of our company, and our factory and assembling plants are now working on a 4,000 car daily schedule for June. The Ford business during April and May was greater by 56,633 cars and trucks than for the corresponding two months in 1920. The Ford factor is still being sold at less than the cost to produce on account of the recent big price reductions, and it is impossible, therefore, to make any further cut in the price of the tractor."

The Ford company also announces that wages of its workmen will not be reduced. The new and the old prices are as follows:

Models Without Starter	New Prices	Old Prices	Reduction
5-Passenger Touring	$415	$440	$25
2-Passenger Runabout	370	395	25
Chassis roadster	245	260	15
Models With Starter			
7-Passenger Sedan	695	745	50
5-Passenger Sedan	760	795	35
Truck chassis	495	545	50

After the touring and runabout $25 additional

Dodge Brothers, Detroit, announced new prices effective June 8, the reductions ranging from $300 to $365. New and former prices are:

Model	New Prices	Old Prices	Reduction
2-Passenger Roadster	$ 935	$1,235	$300
5-Passenger Touring	985	1,285	300
3-Passenger Coupe	1,340	1,715	375
5-Passenger Sedan	1,785	2,150	365

Almost coincident with the statement of the Ford Motor Company that it does not intend to close its plant during either June or July, as has been rumored, comes the report from Toledo that the Willys-Overland Company will operate full time with all its employes, the remainder of this month. So far as July is concerned little or nothing is to be done just now time to make any predictions, although it was announced that the complete manufacturing schedule for next month had not yet been set. Unofficially it was declared by local officials that the force is likely to be kept also next month, as the business outlook is satisfactory.

There will be no reduction in the price of the Briscoe, dealers in several cities announce in advertisements. The Briscoe Motor Corporation, Jackson, they say, will now equip all its cars with front and rear lights, mats on the running board, wind deflector on the windshield, motometers, and the open cars with gypsy curtains, all free of charge. The dealers say this added equipment is worth a reduction of more than $100.

BUILDING & LOAN ELECTION

After having been president of the Grand Rapids Mutual Building & Loan Association for thirty-three years, William Widdicomb has resigned owing to ill health. Charles N. Remington, who has been with the Association more than thirty years, has been elected president, and F. Carroll Follmer, who since 1889 has been a director, has been made chairman of the board. It was announced that the business of the Association is steadily growing. More than $3,000,000 of subscriptions were received by the Association during the last year, or twice as much as during 1919. This year subscriptions during March and April amounted to $734,000.

DURANT IN LANSING JUNE 23

Durant park, given to Lansing by W. C. Durant, will be formally dedicated June 23, with a parade and program. Mr. Durant is expected to attend.

YELLOW CAB NAMES BRADFIELD

Announcement of the appointment of H. C. Bradfield, Detroit, as director of sales and advertising for the Yellow Cab Manufacturing Company, Chicago, is made by that company. Mr. Bradfield, who has been president and general manager of the Bradfield Company, Detroit, has discontinued his Detroit business and is now with the Yellow Cab Manufacturing Company. The Yellow Cab Manufacturing Company, in addition to being the largest manufacturer of taxicabs, also makes Yellow Cab-trucks in the three-quarter and one and a quarter-ton capacities, and a six cylinder high grade motor car, the Ambassador. The company is on a capacity schedule at present.

A Foreign Advertising Adventure

Some Problems Encountered by Hupp Motor Car Corp., And How It Has Proceeded With Their Solution

By FRED ERICK DICKINSON

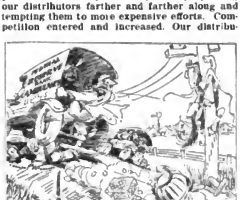
Advertising Manager, Hupp Motor Car Corporation, Detroit

THE COMPANY which I represent entered the field of foreign advertising, as a great many companies in the early days entered it, at the point of least resistance. Within two years of our establishment we had obtained a good, strong foothold abroad, largely through the efficacy of a rather daring and remarkable piece of "stunt" publicity. Within a very short time after that we had established ourselves rather firmly, because of the timeliness of our entry and the peculiar adaptability of our product to the foreign demand.

Advertising, in a formal sense, played a very small part at the beginning of our export merchandising. It is amusing to look back at those early days and note that out of the mass of formal advertising which grew out of our entry into the foreign field, the bulk of it was used in this country to establish ourselves in the domestic field. It apparent ly never occurred to us that information concerning our remarkable world tour could be disseminated through the export publicity media in such a way as to develop our export market. We used this information right at home and profited by it greatly. But that, speaking generally, was as far as it went. The reason for this was our complete ignorance, even after a couple of years of export merchandising, of the ways and means by which export advertising, in a formal sense, is accomplished.

The Distributors Started It

That ignorance, by the way, exists today in the minds of many organizations selling in the foreign field, and I am frank to say that after all of these years, and after considerable study and marked improvement, our organization has not entirely solved the export advertising problem.



But to go back: Circumstances were considerably kinder to us than we were to ourselves. In spite of our almost criminal ignorance of how it could be developed by advertising, our foreign demand increased. The impetus given it by our dramatic entry had not died out and it was further stimulated by what was practically a repetition of the original stunt.

Again, I must confess that that repetition was undertaken largely to furnish material for domestic use. It seems unbelievable, doesn't it, that intelligent men could be so blind as not to realise the possibilities of what they were doing for use in one field and so keenly conscious of its use in another field? But, again, I must give as an excuse the seemingly impenetrable darkness which surrounded formal foreign advertising.

Speaking from the standpoint of an advertising man, we did not deserve the success we obtained; but nevertheless success was ours. Our distributors dotted the globe and they were selling all of our product that we could, or thought we could, afford to give them.

Then, one by one, these distributors, in a very limited and grudging way, began to advertise. In those days they advertised, I sincerely believe, not because they needed it and not because they had a complete realization of what advertising could do for them, but because it seemed the natural and expected procedure for a man in business to spend a certain sum, very indefinite in amount, and very haphazard as to method, in advertising. A great many people at home and abroad are still advertising in this manner. They literally know not what they do or why they do it. It is part of the game, just as the chiropodists, twenty years ago, all wore high hats and the undertakers today all wear frock coats.

But as the years went by, this natural and necessary burden of advertising increased. The publications who profited by it kept pushing our distributors farther and farther along and tempting them to more expensive efforts. Competition entered and increased. Our distributors, with a vague conception of the possible good that might come from advertising, increased their own advertising burden to the point where they began to look around for some one to help them carry it. They naturally looked in our direction.

Irving in the New York Tribune

That Ambulance Will Have to Make a Return Trip If They Don't Slow Down on the Country Roads

At the Mercy of 80

This marked the beginning, with our company, of the division of expense between the factory and the distributor on advertising bills, on the basis of a certain definite amount per car shipped, as the factory share. The distributor wrote his own advertising copy, selected his own advertising media and determined the size and extent of his schedule.

Having entered upon this arrangement, it was continued for a number of years, and it is entirely to the present purpose to tell you that on the whole it was a very unsatisfactory arrangement, and to tell you why.

I am not saying that it could not have been made satisfactory or that all similar arrangements have proved and are still proving unsatisfactory to other organizations. If I am to preserve the integrity of my remarks in a way that will make them in the slightest degree helpful to you, I cannot go beyond our own experience.

As to copy and the things that were printed in public regarding our product we were at the mercy of about 80 separate individuals; practically all of them untrained as writers of advertising; many of them unacquainted with our product except in a most limited sense; most of them, because of distance and widely varying environments, unable to grasp our ideas and ideals. This condition made not only for ineffectious and useless copy but for actually dangerous copy. Statements were made, if not literally over our name, virtually with our sanction, that we could not substantiate. Misstatements were many, exaggerations the rule. In those countries where the precept "Let the buyer beware" still held sway, representations were made that got us into trouble. I recall one instance in particular where our product was advertised as "guaranteed for life." The ambiguous nature of that guarantee, interpreted according to our ideals, cost us money.

The question might be asked at this point: "Why didn't you furnish your own copy, thus helping the dealer out and preventing unpleasant complications?" We did that very thing but our distributors still had their own ideas. It wasn't strong enough for them. Some of them seemed to exaggerate and distort. It did not contain that evanescent "something," the absence of which even a child can detect, but the presence of which no one seems to recognize—good color. Many of them were willing to use our copy and no two of them wanted the same kind of copy. We were placed in the position of writing special stuff for every important country in the world and submitting it to a captious critic in every one of them.

Advertising to Each Other

"Why, then, did you not force the issue and refuse to participate in the expense of advertising of which you did not approve?" We did that, too, and became involved in endless disputes. We were pitted against four acerse "fathers," each fighting for hard cash in the shape of an advertising allowance. Now, an endless discussion carried on across a hemisphere with a man who does not speak or write your language, is a difficult and unpleasant thing. Distributors were alienated. The friction arising from advertising controversies interfered with sales and service. We found ourselves giving in where we should not have given in, simply for the sake of preserving an important connection. Thus bad precedents crept but I defy any one with as much at stake as never found its way into advertising channels. A bad way of doing business, you will say, in. Money was allotted for advertising that we had to have done differently.

I have dwelt at some length on the matter of copy in order that I may save time on some of the other factors. The difficulties that arose around copy typify in a measure the difficulties that arose around the selection of media and the size and extent of schedules.

Theoretically, a man doing business in Australia should know what Australian advertising media to use for his advertising. Actually, that man knows as much about it unless he is an advertising man. The same thing, by the way, holds true in this country. Our distributors by and large were not advertising men. They selected publications because they themselves read those publications or because their friends read them or because their wife's uncle owned them or because the publisher was a good fellow or because the business manager would give them a rake-off or because their solicitor happened to drop in at the time the

Digitized by Google

advertising was being placed. We found our advertising appearing in media that would not sell a car for us in a thousand years. Many distributors displayed a fondness for advertising in their own trade publications, read only by men selling the kind of things that they themselves had to sell—dealers advertising to each other, in other words. Dealers would select an absolutely worthless medium, whose circulation was confined to their own territories, and pass up an excellent medium that would actually sell cars for them, because part of that medium's circulation was in another dealer's territory. Shortsightedness, ignorance and lack of experience controlled our list.

And the disputes and misunderstandings that arose over copy were duplicated and aggravated by the disputes that arose over media.

The differences of opinion that arose as to size and extent of campaigns were not as numerous and serious as were the other causes of contention. Nevertheless, in this respect, and in many places, conditions were not altogether satisfactory. Although we made a certain allowance per car, the amount was intended as a limit and not as a definite recommendation. Hence we found some distributors wasting their own money and ours as well simply for the purpose of absorbing the maximum allowance. One-half the amount, or two-thirds, would have been adequate. As in the case of a distributor who had a limited territory, a fairly active market and only one inexpensive publication covering the entire market, we would find that distributor blossoming out into full page schedules and using all the space would have accomplished the maximum results.

My enumeration thus far has included only what I will call, for lack of a better phrase, the basic difficulties of our plan of sales management at that time. There were many other accessory and supplementary difficulties. In order that our plan might work smoothly and grow of system and be not altogether haphazard and efficient, a considerable amount of checking had to be done. Hence this rule: that a distributor, in order to receive his full advertising allowance, must submit to us month by clippings of his advertising accompanied by receipted bills for the payment thereof. Hardly any distributor, it seemed to us, even after months of education and stimulation, seemed able to comply with these simple requirements. Entire campaigns came without receipted bills; some without bills at all. Duplicates would not correspond in size with the lineage shown on the bills. Additions and extensions were wrong. Rates fluctuated, even in the course of a short campaign. Repeated urgings and warnings failed to bring monthly or regular submission of these claims; and they would all come piling in at the end of the year, or the middle of the year following their appearance. We, on our end, occasionally made mistakes; credits that should have been passed, were not passed, or the amount was incorrect. All of this entailed endless correspondence and an increasing burden of misunderstanding and suspicion and a decreasing amount of actual advertising efficiency.

The New Plan

After convincing ourselves that this particular method of handling foreign advertising was not working out in our particular case, we decided to make a radical change. We inaugurated an entirely different system—the system under which we are now working. That system is not perfect, either in itself or in our application of it, but it is at least a step ahead of thinking, a decided advance over its predecessor. Again, let me say that my implied condemnation of the older plan simply applies to our experience. We could not make a "go" of it. Possibly others smarter than we can do it. It has points in its favor.

Some three or four years ago we announced to all of our foreign distributors that at the expiration of the current season no further advertising allowances were to be made. We told them that from then on we proposed to handle our export advertising in much the same manner as we were handling our domestic advertising. We would make up a list of publications having circulation in the territories of our export distributors, and would run in those publications a consistent advertising campaign composed of advertising which we prepared ourselves. We carefully explained to them our reasons for the change, which were briefly, as follows: We wanted to be sure that our story was being told regularly and steadily throughout our market, and told in our own words. We wanted to guard ourselves against misstatement, exaggeration and insufficiency of statement. We were going to pay the entire cost of this venture ourselves. It was probably the significance of this last statement that smothered the fury of the reaction which was expected. Only those distributors who were obviously misusing and diverting our advertising allowance made any great protest.

So we started in with all of the resources and ability and ingenuity at our command. We made many mistakes—some of them as ludicrous as had ever been made by our distributors. But our mistakes were not perpetuated, because we had it completely in our power to rectify these errors as soon as they were discovered. We had no differences of opinion to iron out, no long-winded and long-distance correspondence to conduct. We were treading on no one's toes and wounding no one's sensibilities.

We are still handling our foreign advertising after this manner and we are still making mistakes, and still, in some instances, wasting money. But these mistakes and these wastes are decreasing. On the whole, every one concerned is as satisfied as one could expect a large and scattered and heterogeneous group to be.

Before going on to more discussion of our methods and experience, and the points of general information that have arisen out of them, let me say that in a few scattered instances, where circumstances seem to warrant it, we are still continuing our allowance system. These places are so few that we are able to keep them entirely under our direction and control.

New Problems

Our change of plan brought with it very many problems, the discussion of which I hope will throw some light of everybody's foreign advertising problems.

First came the handling of the machinery and routine connected with an activity of this size. We decided that this could not be handled by an agency—certainly an agency acquainted with the foreign field and having established relations with the publication and handling knowledge of conditions in that field, and preferably an agency located in this country.

We had many bids for our business from agencies located abroad but we could not see where an agency located in a foreign country, when it came to placing advertising outside of that country's boundaries, would have any advantage over a similar agency located in the United States. We were not established to conduct negotiations with agencies located in each country in the world. We also felt that the complications involved in those dealings would be equal to the complications formerly involved in dealing with each of our distributors. The responsibility would be too much divided. In many countries, of course, no reputable agencies were available. So to an agency located in this country, and familiar from long experience with the foreign field, we turned over the burden of our routine.

The next problem was the compilation of a list. For the sake of saving time and getting started, our first list was largely the work of our agency; but no sooner was advertising started in that list than we began to check up on its individual units, through our distributors, through our foreign travelers and through all other sources of information at our command. Little by little, and here and there, it was changed—in some places expanded, in others contracted; in still other places wholesale substitutions were made.

In making such adjustments this has been our procedure: Whenever a doubt has arisen as to the availability of a certain publication or group of publications, for our purpose, we have gathered together from all of our sources of information, both friendly and unfriendly, all the facts that we could muster; and we have decided the issue on the weight of evidence, combined with our conception of the job we were trying to do. This process will continue, I expect, as long as we are doing foreign advertising. For conditions are constantly changing; the fortunes of various publications are constantly rising and falling; our individual problems are by no means fixed. So much for our list and its history from the beginning to the present.

Cracking the Copy Nut

Copy was the next nut to be cracked. On the question of foreign advertising copy there were, and are, as many opinions as there are individuals engaged in the production of it—plus, I might say, as many individuals as there are engaged in reading it or hearing about it.

We attacked our copy problems, and are still attacking it, from three different angles.

First: What specific purpose were we trying to accomplish aside from the general purpose of the whole general purpose of all advertising—of selling our product?

Second: Placing ourselves in the position of the people who were to read our advertising unaffected, or misinformed, or totally uninformed—what did our common sense tell us should be said in order to accomplish our immediate purpose?

Third: How near to, or how far from, accomplishing our purpose had the independent advertising of our distributors come, and in what way had they registered success or failure?

The first point was easy. The success of all of our advertising effort (and we have been successful, I believe, in that respect) has depended on our ability to establish for our product a certain definite reputation. I will not go into a discussion of the right or wrong of our opinions on this subject, or the technique involved, because it is too big a subject for the present space allotment. But, assuming that our ideas on the subject of advertising copy in general were right, we could see no reason why the immediate purpose of our foreign advertising should differ from the immediate purpose of our domestic advertising.

The disposal of the second point was not so easy. There were so many things that could be talked about, and so many ways of talking about each one of them, that, with the limitations of a moderately sized advertisement and a moderately sized campaign staring us in the face, the decision of what to include and what to discard was a hard one to make. We finally decided that our campaigns should be limited to very brief, simple statements concerning these three things:

1. Brief cataloging of our product—just enough pretty definitely to locate it as to general type and position in respect to other similar products. For example, to explain what I mean, we wanted them to know it was a four-cylinder car, of a certain size, made in certain models and with certain equipment.

2. A modest statement of those qualities which gave our product a certain reputation.

3. With an eye to establishing or promoting confidence, an indication of the age, size and reputation of our concern.

Opinions may differ regarding the wisdom of our confining ourselves to these points, but nevertheless we have so confined ourselves and

Plowing With Pen and Ink

Being a Rambling Yarn About the Crooks Who Make Banks, Bankers and Depositors Their Special Victims

By F. W. HERSEY

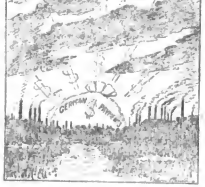
SOME ANCIENT paragrapher has written: "Pen and ink is wit's plough." Whether he had reference to the nimble brains and facile pens of the Jim-the-Penman's of his day, or the poor but honest writers of literature (season this term well before using) we dare not say, but if ploughing means to dig dirt for a living, which is hard, laborious toil, and the antithesis of plough is pen in this sense, then all we have to say is that he meant forgers and "kiters" and not authors. Being in the office boy stage of authorship, with most of our future behind us, we think we know.

One thing is certain: Whenever General Prosperity is A. W. O. L. for any length of time, leaving Major Depression in command of the camp, the bold-up man, the sneak thief, the pickpocket, the forger and the check kiter propagate their species faster than a rabbit can multiply. Of course, the criminal class, including the above craftsmen and their variations, are part of the woof of the social fabric and are as constant and contrary as the weather, but the point we are angling for is that it is not until jobs are scarce and purses lean that "pen-ploughers" of various degrees of ability become so numerous as to attract more than ordinary attention.

In prosperous times the crook and the confidence man organize stock companies and go "wild-catting" where the game is plentiful. They are students of psychology. Come easy, go easy is a trade term with them. When the "kale" is short and below grade they take to living on other men's bank accounts by the power of the pen.

Detroit and Michigan and all the rest of the country have been "in the dumps" financially. There have not been jobs for men who were willing to work, and the need of money has driven many of them to the desperation that often breeds crime. On the other hand, the end of the war released a class of men in whom the germ of criminality always has been more or less active. War is a state of savagery and anything is fair if it puts the enemy hors de combat. Consequently these potential criminals returned to citizen status with less consideration for morals, law and order.

Thus the habitual crook class is augmented by a large percentage of novices and amateurs and cities and towns begin to talk of "waves of crime." Detroit is enjoying one at present. It is a dull day indeed that there is not at least one hold-up. It is a poor, neglected bank that has not been burglarized or shot up, excepting, of course, those institutions having standing armies in garrison all the time. These are violent crimes and are periodic. They, like lightning, seldom strike twice in the same place. They mean rough work and somebody usually gets hurt, but the kind of crime the banks fear and have to face the year around is that of the well-trained hand and clever "front" of the forger and the bank swindler.



These expert penmen, who can duplicate the "John Hancock" of any person short of a Horace Greeley, do not announce their arrival with "Hands Up," or "stick 'em up, you're being robbed," as one Detroit thug said. Sometimes they telephone that they are coming, but they are reticent about the real nature of their errand. Occasionally they write a nice letter and announce their intention to arrive and take away a few thousand dollars worth of bonds. And too often they make good.

Confidence is the very lifeblood of banking. Who, unless he were of unsound mind, would put his money into a bank if he did not have confidence in the institution, its officials and all it represents? The bank swindler plays upon this confidence—the confidence the banker has in his patrons; the confidence the patrons have in the bank, and last, but not least, he relies upon the confidence he has in his own ability to win the confidence the bank and patron do business on. This is involved and full of "confidence," but you get the idea, don't you?

In case you are foxy, let us illustrate with a little tale from the records of Fred F. Christie, assistant cashier of the First & Old Detroit National Bank. This is a little story about a check "kiter," by which we mean one who makes a check for 50 cents look so much like $50 that only he and the check maker know the difference. Well this gent, passing under the name of Rosenberg, came into a Detroit bank with a check for $6.50 made out to Harry Rosenberg and signed by J. Rubin. On the back was written the indorsement, Harry Rosenberg, and address, 672 Jefferson. On the face of the check and at one end was written: "Check in full to 3/27/18."

Rosenberg, or whatever his real name was, took the check to a bank official for his O. K. It was a small amount and the holder of it was affable and prepossessing enough to inspire confidence, and the O. K. was given in the form of a special initial the official used. The smiling young man did not cash the check then but left the bank without the official's noticing. Later he returned and presented the check to the teller. The $6.50 had been raised to $620.20. The bank official's O. K. was displayed, the teller saw no reason to question it, and the money was paid.

What the swindler had done was as follows: First he erased with acid the amount written out in pen and ink and the figures, "$6.50." Then he used a machine to write in red ink "Six Hundred Twenty Dollars Twenty Cents." Where the figures $6.50 had been he wrote $620.20 in very large figures. Where the writing had been wiped out with acid he drew a wavy line. Now the whole job appears to be crude, but when one considers that many bonafide checks are poorly written and often have crudities that become characteristic of the depositor, it is not surprising that the teller did not question

SAME OLD MOTIVE POWER

Digitized by Google

the check. His mistake, as well as that of the bank official, was in not sending the presenter to the bank on which the check was drawn, and which was within a block or so of the bank victimized.

The kiter did not write $620.20 because that was the exact sum he wanted, nor because it was a happy thought. In fact, the "twenty cents" marks this operator as skilled. He knew that an odd number would lessen suspicion regarding the size of the check by giving it a business cast, and also he knew that the "twenty cents" written away from the main figure would draw attention from the raised figures. Such little details do not escape the clever crook. Likewise he had to trust to the possibility that the teller would not have a keen enough sense of smell to detect the odor of the acid used. This would indicate that tellers should be good smellers as well as tellers.

For some months now Detroit and Michigan cities in general have been experiencing a steady increase in attempted and successful forgeries. Along with the so-called wave of violent crimes the "sly-foots," the "soft-voiced" and the "velvet-fingered" are trying to have their day. The amateurs and the novices far outnumber the regulars, which means that every bank must double its precautions, if it already has not done so.

The man who claims the world owes him a living is likely to present his bill any time; and there is as much genius applied to being crooked as to being honest—perhaps more. Michigan is a fine field to work in. It has 672 banks with resources of more than a billion and a half. Although there is no official estimate of the amount of money filched annually from them through worthless checks and other schemes, it probably will run into several hundred thousand dollars, while the amount lifted from merchants and other

How many of these penmen are operating in the country today is unknown. Certainly they are legion. William S. Flick, manager of the Detroit office of the William J. Burns International Detective Agency, said that in the 47 years the American Bankers Association has been in existence, an average of four such criminals had been captured and prosecuted each week. This is a report from only one source.

In times like the present much of the forgery and check kiting may be called spontaneous. The custom of many plants to pay off employes with pay checks has made men acquainted with bank procedure. Either a sudden idea springing up where honesty has been the policy, either from desire or fear or grim necessity, has made forgers out of more than one man and woman. A man gets his pay check. It may be for a sum which his estimation is less than he deserves. The thought of making it what he thinks it should be occurs to him, and if he has the ability and the inclination, he may become a check kiter. Then again, the simplicity of the check-making procedure, combined with ignorance of the penalty for such an act, may induce a man to try forging one for himself. To the degree that the maker is clever, the check will be cleverly made.

Sometimes there is neither rhyme nor reason to the forgery of some individuals. Take the case of a Negro, known as John R. Smith, who for a time made out checks for sums from $8,092 to $23,098 in Rocky Ford, Ga. The checks were drawn on a Detroit bank. Smith had lost a leg in a railroad accident while a railroad worker and the clerk in the bank at Rocky Ford assumed that he had been paid compensation by the railroad. No attempt ever was made to collect on the checks. The Negro simply presented them at the bank for collection and deposit to his account, which he did not have. The answer to this problem is "imitation is the sincerest flattery."

Passing pay checks on small grocers and provision dealers is a standard practice among low grade forgers. They select a locality, study the layout and note the plants paying off with checks, and then scatter a few "phonies" in the region. These checks usually are for small sums in payment for goods with a margin of cash as change. Mr. Christie has a record of that kind of a scheme. This worker, whose identity is unknown, visited a Detroit hotel and hired a stenographer to write checks. The operator was under the influence of liquor and somewhat careless in his manner. He had a list of names, but when the stenographer began work he told her not to use the list.

"Who will I make the checks out to?" the girl asked.

"Oh, I don't care. Make them out to anybody you happen to think of," the man replied.

The girl was somewhat puzzled and did not react quickly, so the forger said: "Make one out to John R. Money; that's a good name." For an hour or more the forger dictated names and the girl made out the checks for sums never exceeding $35, but running about $24.50 and $28.80. These sums represented the usual run of weekly pay checks.

The forger used for Pittsburgh Plate Glass Company, the Detroit Pressed Steel Company and numerous other concerns known to pay their employes by check. Later the operator hired an automobile, usually a cheap second hand machine, and began his calls. He would visit a grocery somewhere on the outskirts of the city, buy a bill of goods amounting to half or two-thirds of the amount of the check, and present the check. It bore the name an address of the payee. For six or eight weeks this crook operated in the city, seldom failed to pass a check and cleaned up about $2,000 in small amounts. What he did with the groceries he bought and carried away no one ever knew.

It was due to Mr. Christie's efforts that the story of the man's operations was learned, but he never was caught. It never occurred to the stenographer that her cue was to call in the police. She told some business man who told Christie about the operations. He interviewed the girl and added the story to his records.

Professional forgers are ever on the alert to get signatures and business cards. One operator met a Detroit business man on the Cleveland boat, struck up an acquaintance and asked for a business card. Later the forger opened the business man's travelling bag and stole his cards and papers bearing his signature. A few days later the business man was surprised to learn that checks bearing his signature had been cashed by his boat acquaintance. The original signature has been carefully traced on checks.

For more than ten years Mr. Christie has made a practice of keeping a record of forged checks and the names and aliases of bank swindlers. Whenever he gets possession of these spurious checks he makes tracings of the handwriting and a complete record of the transactions. Through his records at least twelve dangerous crooks have been brought to justice in the last decade. When the First & Old Detroit moves into its new building Mr. Christie will have a complete identification department with photographic apparatus and files.

"I believe," said Mr. Christie, "that all banks should employ means to protect each other. I have yet to experience any objection to my wiring other banks when questionable checks come to my attention. Although such wires are sent 'collect' and often the telegraph tolls amount to considerable money the banks always are glad to be warned. Incidentally I have been able to nail more than one forger on the spot. In the course of a day's business it is impossible to stop every swindle. A banker cannot assume that every man who presents a check is a crook, nor can he abstain from being accommodating."

"We hear a lot about service being essential to business, and where is there a greater service rendered every day in the year than in a bank. Business diplomacy and courtesy, together with the constant desire to build up patronage, dictates against being 'cold turkey' every hour of the day. Humans will make mistakes, and next to the ounce of prevention we should have co-operative protection direct from the cashier's department. We have the legal machinery, the detective service and the police but the crime must be definitely indicated or committed before these agencies can be called in. When such agencies are called in and the suspect happens to be innocent, a lot of damage has been done, for there are many bank patrons who will set their own pride above the efforts made to protect them against fraud."

One might get the impression from the foregoing that bank officials and clerks are too careless as a rule, but such is not the case. Detroit banks are protected by rules and regulations, by the Pinkertons and the Burns operatives and by special detectives from the Detroit police department. They have their own uniformed guards. There are frequent conferences on safety. Such safeguards make it difficult for swindlers to work their schemes but where they are successful in preventing the loss of large sums of money at one operation, the loss of small sums by one scheme or another is frequently suffered.

The clever crook knows that where in the orderly procedure of events he would not be able to work a trick, if he can create momentary confusion or disturb the mind of a teller by some unexpected turn he may be able to get away with something. He studies bank routine and the bank officials. He picks the teller who may exhibit to his keen eyes evidences of nevousness or some other weakness which may be used to advantage. Then he works a stunt like this:

The name of the operator was Cole. He entered a bank and deposited $4,500, saying at the time that he was a stranger in the city and had come to buy a business and probably would use most of the money within a short time, but would open another account as soon as he took possession of the business. For several days this account was active, but between withdrawals and deposits it remained at $4,500, possibly a trifle over. Cole knew that when a check

Twenty Years in the Life of Charles E. Mitchell

CHARLES E. MITCHELL at 43 is president of the National City Bank, New York, the largest banking institution in the United States. Twenty years ago he was an order clerk in an office of the Western Electric Company, receiving $10 a week salary and learning how little he knew about business. Because this boy, born to comfort and plenty, early recognized how much a man must know to be successful in any vocation, and knowing that important fact, had the desire and the energy to seek the knowledge he lacked, Charles E. Mitchell is today worth $100,000 a year to the institution he directs.

There are many men who may know more than Mr. Mitchell, men whose thirst for knowledge has won them enviable reputations because of their learning, but who are not reckoned as great leaders because leadership was not a strong element in their makeup. Evidently Mr. Mitchell was born to leadership, for in his high school days in Chelsea, Mass., his birthplace, he developed leadership, which, necessarily, implies a certain amount of popularity.

His natural ability to lead instilled in him the desire to lead and that ambition drove him to ten and twelve-hour work days and hard study. His father was mayor of Chelsea. At one time, before financial reverses changed the Mitchell outlook, the son enjoyed reasonable privileges and advantages, but always with some attendant responsibility. For instance, when the youngster desired a pony, his father gratified the wish but gave the boy to understand that a pony meant grooming, and the boy must do it himself.

Charles E. Mitchell learned to groom a pony knew so little, compared with what there and to enjoy it. Consequently when the Mitchell fortunes became depleted, the young man knew that through hard work lay his path to success. In high school his leadership and his growing ability to judge men by their works early manifested itself in a peculiar manner. The school military battalion lost in a drill contest, and in an open letter to the citizens of Chelsea Mitchell, high private in the rear rank, told why the battalion had lost.

He deprecated the interference of the faculty in the selection of battalion leaders who were neither popular nor competent. He called attention to the fallacy of having a drillmaster whose hands were tied and who was none too competent to get out of the boys the best they could give. His third criticism was the fact that there was but one drill hour a week, when there should be at least two. The letter was marked evidence of the boy's ability to find the mistakes and suggest the remedy—constructive, not destructive, criticism.

In Amherst college Mr. Mitchell continued to develop leadership, became a member of the board of directors of the college paper, leader in athletic sports, and was graduated cum laude. Just before graduation the Western Electric Company requested that several promising students be sent to the New York office. Mitchell was chosen as one of the probationers. At that time he had no definite idea what his life's work was to be, and the trip to New York was a venture in prospecting for a vocation.

Soon after his arrival in New York Mitchell was sent to Chicago, where he was listed as an order clerk and paid $10 a week. He was a good order clerk so far as he understood business, but he was not satisfied because he seemed to be to know. With money he had saved he took a course in a business school which helped him in his new position as assistant in the credit department, to which he was promoted soon after. Later, when 24 years old, he was made chief of the credit department.

As the new duties required some knowledge of contracts and agreements Mr. Mitchell began the study of commercial law and had made considerable progress when the company decided to establish a branch in South Africa. Mr. Mitchell was selected to direct this work and was sent to New York to prepare for the task. Later he was called back to Chicago to become assistant to the president. His next promotion was to the position of assistant manager, which came when he was twenty-six years old. Having finished the law course, he next took up the study of electrical engineering. During these years Mr. Mitchell was mastering the details of organization. He conceived the idea of combining a number of factories in one of the allied industries, and to get the necessary financial aid he went to Oakleigh Thorne, head of the Trust Company of America.

After talking with the young man Mr. Thorne persuaded him to come to the bank as his assistant. Mr. Mitchell saw an opportunity to become associated with men who were doing big things and he accepted the offer. He joined the bank in panic times, but his ability was recognized and he was sent to Europe to study investment banking conditions. On his return he found that Mr. Thorne had decided to sell out. Mr. Mitchell then organized his own company under the name of C. E. Mitchell &

CONTINENTAL MOTORS' POSITION

The business of the Continental Motors Corporation, taken as a whole, continues reasonably good under existing conditions, according to one of the corporation officials. Activities are greater at the Detroit plant, where passenger car engines are made, than at the Muskegon plant, where commercial vehicle engines are produced. The report that the latter plant is to close down for 90 days is without foundation, but it may be necessary further temporarily to curtail production. Officials believe they will be able to continue to employ the present force but that much of the night work may have to be discontinued for a time. Customers of the company continue placing orders daily, although not for as large quantities as would be the case under normal business conditions. Both plants will be kept in operation as long as orders are received. In some sections of the country the business improvement is slow, while in other sections the conditions are much better. Taken as a whole, there is no cause for worry and a general improvement will gradually come.

HARFST CADILLAC BRANCH HEAD

Wilbur H. Collins, manager of the Detroit branch of the Cadillac Motor Car Company, has resigned to join his father, R. H. Collins, in the Durant organization. He is succeeded by Richard Harfst, who has been in the office of the president of the General Motors Corporation, New York. Mr. Harfst left a branch managership of the Peoples State Bank to become assistant to Mr. Collins at the Cadillac branch, but later was called to New York.

DURANT PICKING DISTRIBUTORS

C. M. Steves, vice-president of the Durant Motors Company of California, is making allotments of the new Durant car to agencies in the Northwest, according to announcement.

N. A. C. C. ELECTS DIRECTORS

Five new directors elected by the National Automobile Chamber of Commerce are as follows: A. J. Brosseau, Mack Brothers Motor Car Company; A. R. Erskine, Studebaker Corporation; Arran Macauley, Packard Motor Car Company; W. E. Metzger, Columbia Motors Company, and R. E. Olds, Reo Motor Car Company.

NEW SCRIPPS-BOOTH SERIES

The Scripps-Booth Corporation, Detroit, has placed on the market a new medium-weight Scripps-Booth car, known as "F Series Medium Weight Six." The announcement says that the model will in no way affect production on the present "B Series Light Six" models. Some of the important features of the "F" models are the following: Engine, Continental, 3½ by 4½, developing over 60 h. p.; Rouse & Beck disc clutch; Alemite high pressure lubricating system; steel felloed wheels; extra long spring suspension; frame seven inches deep; wheelbase, 115 inches; 32 by 4-inch cord tires; new General Motors axles. The prices of the four body styles are as follows: Three-passenger roadster, $1,470; five-passenger touring, $1,490; four-passenger coupe, $2,350; five-passenger sedan, $2,375.

A. G. PARTRIDGE JOINS STAR

A. G. Partridge, formerly vice-president and general sales manager of the Firestone Tire & Rubber Company, Akron, has been elected vice-president and sales manager of the Star Rubber Company, Akron, having assumed his duties on June 1. He succeeds O. L. Weaver, who has been identified with Star since its organization and who is retiring because of ill health. Mr. Weaver will continue as a director and secretary of the company and will render such assistance to Mr. Partridge as his health will permit.

OLDS PROMOTES SHASSBERGER

Ernest J. Shassberger has been promoted to be advertising manager of the Olds Motor Works, Lansing. He has been with the company since 1918.

ACASON'S NEW MODEL

The Acason Motor Truck Company, Detroit, has just added a ¾-ton truck to its lines, which includes 1, 1½, 2½, 3½ and 5-ton models. The latest of these utility vehicles has a wheelbase of 142 inches, worm-drive rear axle, pneumatic tires and sells for $1,650.

PACKARD EXPORT RESIGNATIONS

Resignations from the Packard Motors Export Corporation are reported as follows: Col. Fred Cardway, vice-president and general manager, who will devote his time to his personal interests; Paul D. Davis, connected with the sales and promotion in foreign trade for both Packard and the Firestone Tire & Rubber Company; Charles A. Cobb, assistant sales manager; Paul F. Mulvey, secretary to Col. Cardway.

PORTAGE RUBBER RECEIVERSHIP

George D. Bates, banker of Akron, O., has been appointed receiver for the Portage Rubber Company, Barberton, O. A petition asking that a receiver be named was filed by the Wellman-Seaver-Morgan Company and several other firms claiming more than $22,000 due them. The petition stated that the Portage concern owed $1,700,000.

In a statement as to the affairs of the company, President M. S. Long said that the trouble was brought about largely through the claims of certain fabric manufacturers for damages for the failure of the company to take fabric which it was alleged it had contracted for during the winter and spring of 1920, at a time when the price of fabric was more than double what it is now.

"A plan had been worked out satisfactorily to the company's bank creditors," says Mr. Long, "and to practically all its merchandise creditors, but some of the fabric manufacturers who are making the largest claim against the company refused to give their assent, and it was this condition which brought about the filing of the petition in bankruptcy. As this proceeding offered the quickest and easiest solution of the company's problems, it would not contest the adjudication in bankruptcy."

FORD PRODUCES No. 5,000,000

The Ford Motor Company built car No. 5,000,000 at the Highland Park plant, last week, and it may be placed alongside the first car in the Ford museum. It is estimated that the total output since the first car was built represents a value of $2,500,000,000, at an average price of $500 each.

MORE GMC RUMORS DENIED

Reports that A. P. Sloan, Jr., vice-president in charge of operations, was severing his connection with the corporation; that the Olds and Oakland divisions were to be sold and that the new St. Louis plant also was to be disposed of, have been officially denied by the General Motors Co.

DURANT CAR IN 90 DAYS

Edward Ver Linden, head of the Ver Linden division of Durant Motors, Lansing, announces that the first Durant car will make its appearance in 90 days. Some of the best engineering talent in the country is engaged on the car, which is to combine many of the Ver Linden ideas. The type is not yet known.

Rapid progress is being made on the assembly plant in Lansing and a part of the factory will be in operation by November. Mr. Ver Linden is personally supervising the selection of shop equipment, which will be installed and turning out cars by January 1. When the first models are complete it is expected that hundreds of dealers will be invited to Lansing to inspect the cars and observe tests and demonstrations. The nucleus of the sales organization has been started.

Temporary offices have been opened on the grounds where the Durant plant is being erected. These are occupied by Mr. Ver Linden and his staff. Much interest is being taken locally in the offer of $500, $300 and $200 prizes for the best letters on the advantages of the Durant scheme of purchasing stock on the installment plan.

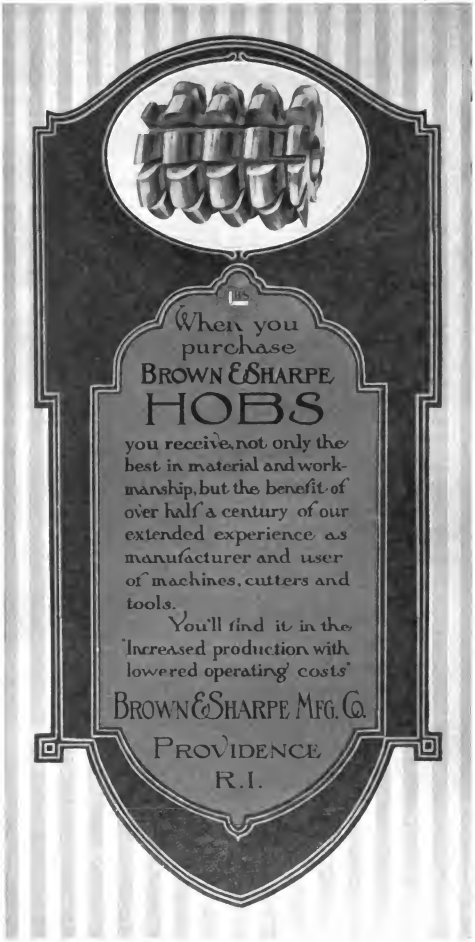
GOODYEAR SALES STATEMENT

Casing sales are reported to be 50 per cent and tube sales 48 per cent greater now than at any time since January by the Goodyear Tire & Rubber Company, Akron.

TOWERS TO JOIN PAIGE

Walter K. Towers will leave the sales and publicity department of the Reo Motor Car Company, Lansing, to become advertising manager of the Paige-Detroit Motor Car Company, Detroit, June 15.

GOVERNMENT SEEKS MOTOR DATA



According to advices from Washington, the National Automobile Chamber of Commerce has assured Herbert Hoover, Secretary of Commerce, that accurate statistics on passenger car and truck production will be furnished the Government by manufacturers. Mr. Hoover said that such figures were desired. Attending the conference with Mr. Hoover were the following: J. Walter Drake, Hupmobile, chairman; Percy Owen, Liberty; Alfred H. Swayne, General Motors; A. T. Waterfall, Dodge Brothers; A. E. Williams, Jr., Garford; Pyke Johnson, Washington representative; John C. Long, statistician; Gaston Plainiff, Ford; J. E. Kepperley, Overland; H. S. Vance, Studebaker; R. A. Hauer, International Motor; M. L. Gemmeway, general manager of the Motor and Accessory Manufacturing Association; Clyde Jennings, of Automotive Industries, and T. F Cullen, of the Automobile Trade Journal.

STATE DEALERS CHOOSE EDENBURN

W. D. Edenburn, automotive editor of the Detroit News, will sever his connection with that publication June 18 to become manager of the new Michigan Automobile Trade Association which was organized May 11 last and which is opening offices in the Garfield building, 4610 Woodward avenue. This is said to be one of fourteen state units of a national association of car dealers and comprises the whole state of Michigan outside of Detroit. The objects are similar to those of the D. A. D. A. Guy Garber, Saginaw, will head the organization.

NO NEW GOODRICH FINANCING

The B. F. Goodrich Rubber Company, Akron, O., announces the resignation of E. C. Tibbetts, advertising manager; R. E. Hackenecr, assistant advertising manager; James O'Mara, in charge of publicity; William Blackwell, purchasing agent, and E. P. Rowen, in charge of Diamond tire sales. President B. G. Work is credited with the statement that the company at no time has been considering financing of any sort, and that the concern is actually in an excellent financial position and is steadily paying off its bank loans and reducing inventories

NATIONAL ASSOCIATION CONVENTION

Extensive plans have been made for the entertainment of delegates of the National Team and Motor Truck Owners' Association to the nineteenth annual convention to be held on board the steamer Noronic, June 13, 14, 15 and 16. The boat will leave Detroit at 5 o'clock on the afternoon of June 13, make Mackinaw island the following day, remain three hours, then proceed to Georgian Bay, then to Owen Sound, Ont., and from there return to Detroit.

During the cruise the delegates will be expected to give a reasonable amount of time to convention sessions and the rest to the program of deck sports and such entertainment as will be provided along the route. At Mackinaw island, for instance, the United States Coast Guard will give a demonstration of life-saving methods and equipment. At Owen Sound the Owen Sound Board of Trade will furnish automobiles for a trip.

To break the tedium of sailing and convention argument, the committee has arranged a program of deck sports, such as balloon shooting, target practice, motion pictures a masquerade ball and other entertainment. The committee in charge consists of E. Foster Moreton, president of the Detroit Transportation Association, host of the delegates, chairman; Thomas O'Brien, Detroit; Joseph X. Galvin, Chicago; Hugh C. Moore, Philadelphia, and Isaac Goldberg, New York.

The D. T. A. is one of the strongest units of the national association.

ITINERARY

The Steamer "Noronic" will run on the following schedule:

Leave Detroit	5:00 P. M., June 13
Arrive Mackinaw Isle	2:00 P. M., June 14
Leave Mackinaw Isle	6:00 P. M., June 14
Arrive Owen Sound, Ont.	2:00 P. M., June 15
Leave Owen Sound	5:00 P. M., June 15
Arrive Detroit	5:00 P. M., June 16

CONVENTION PROGRAM

Monday, June 13
8:30 P. M.

Address of Welcome—E. Foster Moreton, president, Detroit Transportation Association.
Greeting from Michigan—Alex. J. Groesbeck, governor of the State of Michigan.
Detroit's Greeting—James Couzens, mayor of the city of Detroit.
Response from National Association—F. J. Abel, president.

Tuesday, June 14
9:30 A. M. to 1:00 P. M.

A. 1. Roll call.
2. Reading of the minutes.
3. Appointment of convention committees.
4. Nomination of officers.
B. 1. The president's report, F. J. Abel, president, Buffalo.
2. The secretary's report, F. L. Henk, secretary, Detroit.
3. The treasurer's report, W. J. McDevitt, treasurer, Cincinnati.
4. Report of standing committees.
C. Address—"The Horse—The Short Haul Money Maker," Wayne Dinsmore, secretary, Horse Association of America, Chicago.

8:30 P. M. to 10:30 P. M.

Address, "Uniform Methods in the Cartage Industry," Joseph W. Glenn, Buffalo Trucking Association.
Address, "Truck and Cargo Insurance," C. M. Carter, Detroit Insurance Agency.

Wednesday, June 15
9:30 A. M. to 12:30 P. M.

1. Address, "Motor Truck Costs," R. W. Andrews, transportation engineer, Packard Motor Car Company, Detroit.
2. An open discussion on the subject of this speaker will be held.
3. Unfinished business.
4. New business.

Thursday, June 16
9:30 A. M. to 12:30 P. M.

1. Address, "Insurance, Highway Transport, Teams' Liability, Live Stock, Special Hazards," C. M. Carter, Detroit Insurance Agency.
2. Address, "The Future of the Motor Truck," W. W. Kreh, Goodyear Tire & Rubber Company.

FIREPROOF STORAGE'S BUSINESS

The Fireproof Storage & Transfer Company, Lansing, reports a good business, with its large new storage structure being gradually filled with all kinds of goods. There are six stories, to be devoted largely to commercial storage. H. H. Hardy, of the company, reports that while the concern is doing a big business in general hauling and storage, the use of commercial trucks enables it to give other service, such as lifting heavy articles to upper floors of buildings. Recently the company hoisted a 4½-ton boiler twenty feet to the second floor of the Tolling Belle Vernon Creamery company building, at Mason.

BUSES IN THE FAR WEST

Bus operation in the far west is building up many sections that have not expanded for generations. In California alone more than 3,600 motor buses travel daily out of Sacramento, Stockton, Fresno, Oakland, San Francisco and Los Angeles. More than 5,000,000 persons were transported in this district during the last twelve months. Accidents have been negligible.

About Yellowstone Park, the Grand Canon and other show places much has been done with bus operation. This branch of activity promises to develop into one of the important units of the automotive industry, along with the passenger car and the truck.

SERVICE FOR SCHOOL CHILDREN

Hillsdale county's consolidated school is the latest Michigan rural educational district to install motor bus service for its children. A bus has just been purchased from Fred L. Waite, Lansing.

TERMINAL PROVIDED IN LANSING

Bus service has grown so considerably in Lansing that the city authorities have set aside a terminal for this class of transportation. Grand avenue, from Ottawa to Ionia avenue, has been closed to other traffic.

William R. Wilson Heads The Reorganized Maxwell

William Robert Wilson, formerly a Dodge Brothers executive, and until this latest change vice-president of the Irving National Bank, New York, and a strong board of directors, consisting of financial men and prominent manufacturers, now control the new Maxwell Motor Corporation, reorganized from the Maxwell and Chalmers motor units by Walter P. Chrysler. Mr. Wilson is president of the company and Mr. Chrysler chairman of the board.

W. Ledyard Mitchell, former president of the Maxwell unit, and active in the reorganization, becomes vice-president of the new corporation, and with him are Arthur E. Barker, formerly general sales manager, and Carll Tucker, as vice-presidents. T. H. Thomas is the comptroller. The other directors are C. C. Jenks, Dr. Fred T. Murphy, Allen P. Edwards and Harry Bronner, all of Detroit; J. R. Harbeck, James C. Brady, Elton Parks, J. S. Bache, E. R. Tinker, Harry Sanderson, Thomas F. Doherty, T. C. P. Martin, all of New York, and Mr. Wilson and Mr. Tucker.

The new president of the corporation is 37 years old, was born in Chicago and was graduated with honors from Armour Institute of Technology in 1906 with the advanced mechanical engineering degree for exceptional work in engineering. For several years he was engaged in work requiring skill in directing operations, construction work, sales and cost-accounting. His entrance into the automotive industry was as assistant to the general manager and assistant manufacturing manager with the Studebaker Corporation, from which position he was called to the Dodge Brothers' plant to assist in organization and extension work.

His ability to select the right men and his advanced ideas of organization and development work attracted the attention of bankers and eventually he was called to New York to become vice president of the Irving National. While with the Dodge organization Mr. Wilson picked most of the executives who are now with the company.

Mr. Mitchell is one of the best known automotive men in the country and has been with the Maxwell concern since 1915. Mr. Barker formerly was a sales executive with the Dodge Brothers but joined the Maxwell company when Mr. Chrysler became chairman of the reorganization committee. He has been in charge of the commercial affairs of the company. Mr. Tucker has been associated with the Maxwell organization as representative of the Brady interests in New York and is one of the principal stockholders in the corporation.

NEW WELDING CONCERN

The G. E. M. Welding Company has been organized in Lansing and is doing business for the Olds Motor Works. It will also do a general welding business. It is located in a new building just completed. E. J. Mackey and Edward Gaffney are the organizers.

VIM TRUCK SELLS OUT

The Vim Motor Truck Company, Philadelphia, has been sold to the Standard Steel Car Company, Pittsburgh, which will operate the company as a subsidiary.

GOODYEAR PRODUCTION REPORT

The Goodyear Tire & Rubber Company is producing 17,000 tires a day and sales for one week recently reached 48,000 units, the largest any week since September, 1920.

NEW STEVENS-DURYEA DIRECTOR

Stevens-Duryea, Inc., has elected John G. Perris vice-president and director in charge of manufacturing and engineering. The company is located in Chicopee Falls, Mass.

Colombia Treaty to Help Commerce With America

H. P. Rousseau, of the Litscher Lite Corporation Grand Rapids, has returned from a trip to Colombia, South America, where he went on a special mission to instruct dealers in Litscher Lite plants. Referring to his trip, Mr. Rousseau, in the course of a letter to this publication, says:

"At the time I was in Colombia the so-called "Colombia Treaty Measure," which included the payment of $25,000,000 to Colombia by the United States, was receiving discussion, and as this measure was passed by Washington while I was there I can say that it had a decided effect upon the feeling of Colombians toward citizens of this country.

"I believe that trade relations between Colombia and the United States are going to be much benefited by this measure, although many people in this country feel that it should never have been passed.

"My time was spent at Cartegena and Barranquilla, both good sized cities, but decidedly lacking in sanitation, as they are on the coast and are terribly hot, even though I visited them during the cool season. I was informed that in the mountainous interior of the country the climate is much better, but I do not believe that Americans would care for the seacoast of Colombia during the hot season.

"There was a tremendous business done in bananas in the section I visited, and of course there is nothing in the way of manufacturing. Very limited sanitary conditions, and hotel accommodations exceedingly poor, and very uncomfortable. Oil is found in Colombia, in fact three representatives of the Standard Oil Company went down on the same ship I did, but I did not get into the oil country."

TRANSPORTATION NEWS

Rail :: :: *Water*

Detroit—The Detroit, Toledo & Ironton Railroad is considering the proposal of the Wyandotte Board of Commerce that the railroad provide commuter service between Detroit and Trenton and points touched by the D. U. R. with the use of gasoline cars.

Washington—Recent decisions of the Interstate Commerce Commission are as follows:

Detroit, Toledo & Ironton Railroad given permission to issue $182,000 in first mortgage bonds to be sold at not less than par and accrued interest to principal stockholders, proceeds to be used to reimburse treasury for expenditures between July 1, 1919, and July 1, 1920, and for additions and improvements. The bonds are to bear 5 per cent interest.

The Pere Marquette is permitted to pledge and repledge all or part of $3,231,000 of its first mortgage bonds, Series A, held in the treasury as collateral security for notes, for a sum not to exceed $2,100,150. The bonds were authenticated by the corporation trustee under the mortgage securing them.

The complaint of the Dewey Fuel Company, Jackson, against the Cincinnati, Northern and other railroads, charging excessive rates on coal, i. e., $2.20 instead of $2.10, was dismissed. The rate was declared not unreasonable.

Mulkey Salt Company, Detroit, was awarded $72.60 damages for misrouting of salt consignments in 1917 by the Wabash Railroad.

Interior Lumber Company's complaint against the Boyne City, Gaylord & Alpena Railroad, charging excessive rates on lumber, dismissed. The company is located in Pittsburgh.

Sault Ste. Marie—The lake steamer W. Grant Morden passed through the Canadian locks a few days ago carrying 765,000 bushels of wheat and barley, thus breaking the former record by 8,000 bushels.

Detroit—The Pere Marquette's summer passenger schedule went into effect Sunday, June 5. A number of changes were made. Detailed information may be had at any P. M. office.

Philadelphia—The Pennsylvania Railroad Company reports that its April business was the largest so far this year, the total being $44,717,812, gross. On the other hand, operating expenses for the month were also the highest thus far, totaling $43,082,619. The total gross operating revenue for the first four months of 1921 was $164,543,308 and the operating expenses $152,223,271, there being a net operating income balance of $2,522,238. Expenses of operating the road are steadily decreasing. For instance, the cost in connection with maintenance of equipment, which totaled $13,779,696 in January and more than $12,000,000 both in February and March, was reduced to $9,462,603 in April. Transportation expenses have been reduced from $22,605,903 in January to $16,944,563 in April.

Detroit—The Wholesalers' Bureau of the Detroit Board of Commerce is organizing shipping clerks and traffic men working on less than carload lots into an organization that will be able to work for the improvement of deliveries.

Washington—The efforts of the Grand Trunk to compel the Secretary of the Treasury to issue a warrant for $500,000, part of the government guaranty, have failed as a result of a decision of the Court of Appeals of the District of Columbia affirming the findings of the District Supreme Court, which denied the mandamus asked by the railroad. The refusal of payment was due to the fact that a final accounting had not been made by the railroad.

Grand Rapids—During May the Grand Rapids & Indiana division of the Pennsylvania Railroad handled 33,715 cars of freight, as compared with 43,392 a year ago. The road operated 948 trains.

Prominent Advertising Men Organize Albee Corporation

The Albee Corporation, advertising service, has been organized in Detroit with offices in Detroit, Chicago and Milwaukee. The officers are Harry C. Maley, president; Albert L. Gale, vice president; William N. Albee, treasurer; Major Walter C. Cole, secretary. These and Joseph Meadon are directors. The principal offices of the new corporation will be in the Marquette building, Detroit, although the corporation's Chicago business will require the maintenance of a number of its principals and extensive offices in that city

The Albee Corporation will have no connection with the business of the William N. Albee Company, also in the Marquette building, which concern has been engaged for several years as sales and advertising counsel to a number of important automobile manufacturers. There are no changes in the organization of the William N. Albee Company. Mr. Maley, who will be the active head of the new corporation, was formerly in the engraving business, a farm paper publisher, a member of Critchfield & Company, and until recently was at the head of the Chicago office of the Fred M. Randall Company as first vice-president.

Mr. Albee, formerly a newspaper publisher, has for several years been and will continue to be president of the William N. Albee Company of Detroit. Mr. Gale was for years a newspaper man and will be in charge of the Chicago office.

Major Cole, before the war, was secretary of the Detroit Board of Commerce, the Adcraft Club of Detroit, and other affiliated organizations with the Board of Commerce. During the war he commanded the motor transport of the 89th Division. Mr. Meadon is president of the Franklin Press and prominently identified with the advertising and printing businesses in Detroit. He is president of the National Direct Mail Advertising Association and prominently identified with the Associated Advertising Clubs of the World. Associated with these men are C. W. Walther, J. A. Hoppes, W. L. Haskell, H. B. Joslyn and others whose names are well known in advertising circles.

W. F. Holliday, for the last five years a member of the advertising department of the Burroughs Adding Machine Company, has resigned to accept a position as one of the principals of the plan and copy department of the Albee Corporation.

For two years Mr. Holliday has been editing the Burroughs Bulletin, which under his direction has gained recognition as one of the best sales publications in the country. He has also done copy writing, field research work and merchandising work while with the Burroughs organization. In addition, Mr. Holliday has had a considerable amount of practical advertising agency experience in the East and for a number of years sold goods on the road.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—The steel skeleton structure of the new Prudden office building is being erected, although the work has been somewhat delayed by the breakdown of a car in which steel was being shipped to Lansing.

Detroit—The city has decided to proceed with the construction of a municipal garage to cost $500,000. It will be located on city property, will be three storied high, built of reinforced concrete, and have 50,000 feet floor space. The third floor will be devoted to repair work and construction of special bodies.

Cheboygan—The county road commissioners have awarded the contract for grading and improving six miles of highway on trunk line No. 10 between this city and Aloha. The work is to be completed by January 1 at a cost of approximately $48,000.

Detroit—John Finn & Sons, general contractors on the two-story and basement, brick and stone printing establishment to be erected at Moran street and East Grand Boulevard for the Friesema Brothers Printing Company have let the following sub-contracts: Excavation, Detroit Excavating Company; plastering, Interstate Plastering Company; roofing and sheet metal work, Detroit Cornice and Slate Company; painting, Jos. Schafer & Company; marble, Christa-Batcheider Marble Company; terrazo, Michigan Tile & Mosaic Company; stone, artificial, the Maul Company; reinforcing steel, Truscon Steel Company; steel sash, David Lupton's Sons Company, steel rolling curtain, Kinnear Manufacturing Company; carpentry, Rozycki Bros.; freight elevator, structural steel, miscellaneous iron and steel, and steel stack, Tietema Work; steel and steel form erected, Des. Lauriers Metal Products Company.

Lansing—Directors of the Korff Manufacturing Company will rebuild the plant, recently destroyed by fire, if finances can be raised through the sale of treasury stock. About $8,000 will be required to repair the damage and put the plant into operation. About half of this has been subscribed. The company does a national business in undertakers' equipment and other lines.

Detroit—Among the contracts awarded by architects and contractors during the week ended June 2, as mentioned in the report of the Builders' & Traders' Exchange, were the following: A department store building to be erected at Michigan avenue and Lockwood street; a factory building at Junction and Herbert streets for the Artesia Water Company and a number of sub-contracts for stores and residences. Among the important items reported in preparation by architects were the following: A three-story fireproof steel construction club house; a brick ladder house; three brick stores; a 32-family apartment building; a two building brick veneer flat building; brick and steel additions to the Pierce and Ilely schools; a 19-family brick apartment building and a two-story brick and reinforced concrete market building.

Saginaw—There was much less building work done during May this year than during the corresponding month a year ago. Total number of permits taken out was 228, involving an expenditure of $221,609, as compared with 276 permits and costs of $412,952 a year ago. Of the 228 permits issued in May, 85 were for garages and minor buildings, 32 for dwellings, 109 for repairs and alterations, one for a church and one for a state fair exhibit building.

Detroit—Three hundred seventy-nine permits were issued during the week ended May 28, the cost aggregating $959,656. This compares with $837,005 for the previous week and $1,612,570 for the corresponding week in 1920. Of the 379 permits, 234 were for new buildings, as compared with 188 for the week of May 21 and 279 for the corresponding week a year ago. The 145 permits for alterations or additions involved $233,430, as compared with $142,850 for the previous week, when 98 permits were issued, and $682,675 in 1920, when the total was 167.

Cheboygan—The state highway commission is expected to begin shortly the construction of a one-mile stretch of concrete highway in Mackinaw avenue, extending from Main street one mile west. The city council recently voted not to levy an additional tax to raise $12,800 for making it a curb-to-curb pavement.

Detroit—Fair weather, plenty of materials at fair prices, abundant labor supply and ready transportation have enabled the Wayne County Road Commission to lay 103,007 square yards of concrete road (9.8 miles) up to June 1. For the last ten years the date for pouring the first concrete has been on or about May 20. Road construction progress is averaging about two miles a week.

Pontiac—During the week ended June 4 there were issued ten building permits, the most important being for an addition to a shop, to cost $2,000.

Detroit—The total number of permits taken out during May was 1,843, as compared with 2,296 during the corresponding month in 1920. The outlay involved this year was $5,203,710, as compared with $5,739,815 a year ago. There were 1,251 permits for new buildings and 592 for alterations and additions, compared with 1,574 and 722 respectively last year. The list of new buildings is made up as follows: Automobile sheds, barns, etc., 761; single residences, 369; stores, 32; two-apartment residences, 56; stores and tenement houses, 21; lumber sheds, storage places, 11; major garages, 10; churches, 3; schools, 1; stores, 2; warehouses, 6; factories and shops, 3; banks, 1; miscellaneous, 25.

Grand Rapids—Three hundred and eighty-six permits were issued during May involving an expenditure of $586,630, as compared with 293 permits issued a year ago and involving $564,122. There were 62 permits for residences, the high mark thus far this year for this class of buildings. During the week ended May 27 permits issued totaled 83 and the cost involved was $157,410. Of the number, eleven were for residences. For the week ended June 3 permits totaled 61, the lowest number since the end of March. The expenditure involved was $154,600. Of the permits, thirteen were for new construction. The largest item was for a two-story factory to cost $50,000 for the Office Metal Furniture Company. Total expenditure for building and repairs from January to the end of May is recorded as $1,778,352.

POSITION WANTED

Young man (college graduate) with executive ability and wide knowledge of markets, prices and general business conditions, wishes to become associated with Detroit corporation in capacity where this knowledge may be fully utilized. Have until recently been on staff of largest financial newspaper in the East. Am now doing independent work for prominent Detroit institution. Can organize and develop statistical department, take complete charge of publicity or would make capable assistant in executive. Opportunity, not salary, is of primary importance. Address Box 418, Michigan Manufacturer and Financial Record.

Michigan Students Seek Foreign Trade Positions

With the resumption of world commerce it is likely that manufacturers will give considerable attention to the organization of their foreign trade personnel. The demand for representatives abroad and employes at home who understand trade conditions and psychology of various countries will be considerably stimulated. One of the best sources of supply for such brains will be the national employment bureau of the American Cosmopolitan Club, an organization of foreign students in the colleges and universities of the United States.

There are 12,000 such students in this country, and every large college and university has a chapter of the American Cosmopolitan Club. Its purpose is to bring together the American and foreign students in a better understanding and to provide better opportunities for these foreign students to understand American ideals and customs.

The employment bureau has been established to help foreign students obtain temporary or permanent employment while in this country. At the University of Michigan there are 250 alien students, many of whom seek employment in the vacation period, while others remain in the country after graduation long enough to learn the American way of applying the business or professional knowledge they have been acquiring. It is believed that the employment of these students by manufacturers would be of mutual benefit. The manufacturer would gain the advantages of the student's knowledge of his own country and its trade requirements, while the student would learn about American goods and manufacturing, so that in later years in his own country he would be capable of representing the concern he once worked for, or, if in business, he would have no cause for prejudice against the American trade mark.

The bureau lays no obligations either upon the employer nor the student, and the expenses of maintenance are borne by the American Cosmopolitan Club. Contributions to this work have been made and will be accepted with gratitude, but it is not money that the club desires most, but co-operation of the employers by giving employment to foreign students when possible. Dr. Leonard, University of Minnesota, is president of the club. The University of Michigan has a chapter, for which Prof. Hildner is faculty advisor, and to whom communications regarding the bureau should be addressed.

COLUMBIA REDUCES PRICES

Lower prices were announced by the Columbia Motors Company, Detroit, June 9. Also a new lower priced model. The reductions range from $150 to $400. The new and the old prices are as follows:

Model	New Prices	Old Prices	Reduction

The Proposed Treaty With Mexico

THE OFFER of a treaty of amity and commerce, made by President Harding's administration to the government of Mexico, is the most forward act that could have been made toward the betterment of trade conditions in the United States. Mexico is a great customer of producers of merchandise, and she has not been our customer in the past. There is scarcely a hardware store in the republic that is not German. There is scarcely a drygoods store that is not French. The products of France and Germany in these lines have found their way to Mexican consumers almost exclusively in the past. The railroad situation in the country is very bad. The railroads are about half running. It will take, in the judgment of those who claim to know most about the subject, from $300,000,000 to $400,000,000 of materials to rehabilitate the railroads of the republic. While a great deal of American railroad supply was furnished the Mexicans in the past, a great deal more of it came from England and Germany.

The dispute with Mexico which must be settled first concerns reparation for the lives of American citizens which were taken during the revolution. There are said to be more than 500 cases of this kind. Once this point is covered, there is really little to be settled. The titles to properties held by foreigners have furnished some basis for controversy. But it is noteworthy that there are titles and titles. There are large foreign investments in timber and plantations as well as in mines and oil properties. So far as has been reported, there has been no sequestration of the titles to timber lands and plantations. People holding deeds to such properties seem to have no fear that their deeds will be annulled. This leaves mining properties and oil properties in controversy. It is not to be presumed that any nation, whether it be the United States, Great Britain or France, will tolerate the wiping out of titles to property in Mexico held by its nationals, without reparation. Mexico is not fixed financially to make reparation for the conversion of such properties to the benefit of her own citizens, nor are her citizens fixed so as to acquire them and make payments which might be used for reparative purposes. Consequently the only disposition which could be made of such properties would be to offer them to other foreigners than those who now control them. Such a course could be only provocative of international jealousy and the Mexicans have some pretty smart diplomats who will not add this as a new difficulty to the rehabilitation of their country.

Mexico can make money very fast, once she is settled [illegible] to be a valued customer of the United States. The problems of exportation and importation between the United States and Mexico are less intricate than those with customers farther afield. The principal one is the problem of credit. The merchants of Mexico have been brought up on a system of payments with twelve months and sixteen months' acceptances, which were usually handled in England on a low with other countries there is no special reason why the Mexibasis of discount, not more than 5 per cent. If we are going to have financial problems in connection with export dealings can problem should seem so hard as to be evaded.

The administration program of renewal of conditions of peace and trade with Mexico opens up, therefore, very large possibilities of immediate trade with the United States. The fact that the proposals come from the United States and include all our basic requirements tends toward speed in negotiation, inasmuch as the Spanish diplomacy has always seemed to lack complete initiative, and was marked by delay in leaving something out every time a schedule of proposals for agreement was made from that side first. The treatment of the Mexican situation by the American government is marked by intelligence and good order, as it will no doubt be also marked by justice and good nature. The opening up of a Mexican market just now would be to the present and permanent advantage of the United States.

The Income Tax Proposal

AT THE TIME this paper goes to press it looks as if the influence of the Governor's office over the Senate of the state is going to be efficacious in forcing that body to submit a constitutional amendment making an income tax possible for state purposes. Some time ago the corporate and industrial interests of the state were lulled into a state of false security by the administration by suggestions that they accept the corporation tax, in the hope that the income tax would not be pressed by the politicians and the agriculturists. Now that the corporation tax has been provided for, with the result that the state's deficit will be paid by industry and not, in any portion, by the general properties of the state, the same influences which put the corporation tax over are at work to make provision for an income tax.

The attractiveness of an income tax is accounted for by the possibilities which lie in it for exempting the general properties of the state from any form of taxation. It is quite true that there is a possibility of retaining the system of taxing the general properties directly and making the income tax a source of supplementary revenue. But it is also equally possible to make the income tax and the corporation tax the principal sources of state revenue, to the exclusion of any general tax. If such a system were applied, the result would be to load approximately 65 per cent of the total cost of the state's government upon Wayne county, an immense portion of the remainder on Kent county and the balance upon Oakland, Genesee, Bay, Saginaw, Jackson, Calhoun and Kalamazoo. These are the great industrial areas of the state, and it is fair to say that 95 per cent of the income tax would fall upon them. Under no redistribution is it likely that the mineralized counties would pay more than they pay now.

This situation may cause the industrial counties of Michigan to stand up on their own defense in a way in which they have not stood up before. Whatever injustice there may be in a tonnage tax or in taxes upon timber removed from the taxable areas in which it grew and is standing, it is not nearly so unjust to adopt such a system as it would be to levy practically all of the state's burdens upon the counties which are the seats of manufacturing industry. Indeed under the new conditions which have come about in the last half year there would be no injustice in a tonnage tax at all. Minnesota is today the greatest iron ore producing area in the Great Lakes district, and, for that matter, in the entire country. The state of Minnesota has, during the last session of its legislature, put a tax upon the production of minerals, which means iron ore, in the form of what is called a vocational tax; but which, whatever its name, is a levy of 6 per cent upon the value of iron ore taken from

Digitized by Google

the mines within that state. There are some questions of the constitutionality of this tax, which will be cleared up in due season. If the tax stands, and with Minnesota making the market price of iron ore, inclusive of the tax, the producers of Michigan iron ore will be in the position of collecting the tonnage tax from the consumers, with this difference, that where the Minnesota tax goes into the state treasury, the Michigan equivalent will go into the treasuries of the mining companies. The industrial counties, in this condition, may well inquire why the tonnage tax should not be enacted, to their relief, and to the discomfiture of the mining counties.

If the income tax amendment is presented to the people, we have no doubt that very many voices will be raised to make it look very attractive to the populace, and especially to the agricultural element. Yet we are not inclined to believe that, down at bottom, the agriculturists of this state are so radical as to desire to load their tax burdens upon manufacturing industry. The duty will, therefore, devolve upon the people of the industrial counties of presenting the case of the viciousness of the income tax to their fellow-citizens so clearly and so judicially that the state will not run away with the issue and pass it without thought. The existence of the federal income tax and its administration have shown commerce and industry how burdensome and discouraging such an impost can be.

Mr. Staley's Address

THOSE BANKERS—and others as well—who did not hear the annual address of President John W. Staley before the convention of Michigan bankers on Monday will do well to give it a careful examination. The full text of the address appears in this issue. And those who were so fortunate as to attend this session can well afford to refresh their memories by rereading Mr. Staley's remarks, for they will find much of guidance for the future, and sane hopefulness. The implication is clear all through the address that the worst has been passed; the comparisons of conditions here, even at their worst, with conditions in other countries prove clearly that on a basis of comparative injury due to the war, our hurts have been slight and we have much for which to be thankful.

Mr. Staley's appeal for economy is timely. And his remedy is worthy of consideration. Eleven billions are spent annually for what "we would all admit to be extravagance." which Mr. Staley proposes we cut in half and apply annually five and one-half billions of savings toward wiping out our national debt.

It is refreshing, too, to read a paper such as his which not only criticises but offers as well a workable remedy. Men who devote their lives solely to the management of banks do not espouse a calling in which there is much popular applause these days, nor is there the opportunity, if a banker wishes to render the utmost to his clients, for private gain such as obtains in the industries; therefore the impelling motive which tends to hold an able man to his job in a bank is love of the job and an innate belief that it is his first duty to serve. And more often than not such men are not bringing axes to grind at the bar of public opinion. They represent too many diverse and opposed business interests to risk their deposits by taking up the cudgel for any one class of customers. So it is for these reasons that the bank customer as well as the banker may have faith in the absolute unbias of an address such as this editorial makes reference to.

Curiously, the three most important national problems confronting America as set forth by Mr. Staley, may be described popularly as "the three T's"—taxation, tariff and transportation. And it is precisely as Mr. Staley says: "These questions are all directly or indirectly related to finance, but a question which supersedes all these as it affects our finances, and in the relative importance of its immediate need, is a constructive plan for refunding the national debt." We cannot indorse this expression too strongly, and we recommend this presentation with particular urgency to the business man, for in the sensible postponement of due date of our national debt and a proper shifting of it from the banks to individuals, the first two "T's" are half solved. And by a return to the sensible economy of personal and public expenditures the other half is solved.

But the third "T" (transportation) is not so easy of solution. Nor did the speaker offer a prescription for solving it. We can picture readily the ill effects of artificially sustained railroad costs in a country which has billions invested in industries hither and yon dependent for their prosperity on the foundation principle of reasonable transportation costs. Coincident with every dollar's drop in the cost of everything else but transportation, the latter becomes an increasingly serious bar to normalcy (whatever that may be). It does no good to lend the Texas farmer money from the federal treasury against his crops if at some time soon he shall not be able to get those crops to market and sell them for more than the amount of the freight bill. And likewise it is of no avail for the War Finance Corporation, or any other government body, to help an industry in carrying its debt if it cannot get its raw material to the factory and its finished product to market at low enough figures to permit of a profit. With every drop in selling price of any article which must be transported, and there are few not so affected, the fixed charge of transportation just helps to close the door to better business for the maker of those articles in direct proportion as the percentage of transportation costs in them is to other costs.

The significant statement that this generation will not see a return to normal conditions is exceedingly sane and wise counsel, and rather than being a cause for alarm is more a valuable hint to those who have the old familiar speculative stunts up their sleeves awaiting easy money, to turn to that business which will reurn smaller profits yet which will contribute to the well being of all the people.

Short Measure Stuff

POOR SPORTSMANSHIP

BOLSHEVISM, socialism et al are funny theories. When American industry was booming along on the crest of high production to meet abnormal demand the nation was honeycombed with cliques that wanted to take it over by force and operate it "for the benefit of the workers."

Today, when there are great enterprises that could be bought for a song, or in some cases unloaded merely for the privilege of getting the obligations transferred, the desire to wrest possession from the capitalists, so-called, seems to have disappeared.

It would appear that the restless minority is perfectly willing to take over the winnings but when the ownership of property incurs obligations under any system that deals equitably with the rights of others, then that is another story.

The reds and the wobblies ought at least to make a showing, when the market on the stuff they say they would like to control is at such low ebb. Otherwise they are apt to be accused of bad faith by their own supporters.

* * *

A DANGEROUS SUGGESTION

"Iron Ore," published at Ishpeming, Mich., has started a movement to popularize the game of pitching horseshoes as a home pastime, and sets up the advantages of having the shoes made of copper, in order to stimulate demand for the red metal, produced in such large quantities by the paper's subscribers. That would be all right if they would issue an insurance policy with every set to guarantee that the Mrs. wouldn't get playful after hubby comes home from his night out.

* * *

No financier was ever so concerned about the possibility of a run on his bank as his secretary would be over a run in her stocking.

* * *

Nowadays the average citizen is less interested in Russian developments or the return to normalcy than in the size of the reduction in automobile prices.

* * *

Someone told us the other day that traffic cops would rather not have to bawl folks out, but judging from observation, we doubt it.

* * *

We often wonder how a phonograph record feels after it finds its way into a barber shop or shoe shining cabinet and can't get out.

*Steffens Plant.

A letter to the stockholders, and a list of the directors and local managers, follows:

To the Stockholders,
Holland-St. Louis Sugar Company.

Because of the unusual combination of extraordinary difficulties and of uncontrollable expenses and losses during our fiscal year just closed, our financial statement herewith is far from being what, six months since, we had reasonably to expect it would be.

Our beets were necessarily contracted for at the peak of high prices early in the year 1920. Unexpected advances in railroad freight rates during the year cost us over $130,000. Our coal, packages, and other supplies cost us at least $300,000 more than the same amounts would cost us our this year's prices. We were forced to pay for our best seed $30,000 in excess of the normal price. The labor market and labor competition were such as to compel us to pay for beet laborers $130,000 more than was provided for in the farmers' contracts. The abnormally warm weather during the entire manufacturing season caused a large deterioration in the quality of the beets and the consequent lowering of the sugar content. Contrary to the world's expectation, the price of sugar declined instead of advancing from the time we entered the market in October. Because of these and other facts of similar nature the result of our year's operation is very unsatisfactory, showing a loss instead of a gain.

Should we purchase the same tonnage of beets next fall and winter as last, with sugar at six cents a pound, the beets would cost us $730,000 less than they did last winter. All in all we look to the future with hope and courage and we promise you our best efforts for a better report next year.

Respectfully submitted,
C. M. McLEAN, General Manager.

Directors: G. J. Diekema, president; Cass T. Wright, vice-president; C. M. McLean, secretary-treasurer; John J. Bale, J. J. Cappon, C. J. Den Herder, F. C. Hall, Geo. E. Hunt, A. La Huis, J. W. Pfeiffer, Howard Van S. Tracy, J. A. Vander Veen; general manager, C. M. McLean; local managers, Holland plant, S. R. McLean; St. Louis plant, B. C. Hubbard; Decatur plant, J. H. Carmody.

CONSUMERS POWER CO. REPORT

(Ann. Report, December 31, 1920.)

OPERATIONS

The combined results of operations compared with 1919 and 1918 are as follows:

	1920	1919	1918
*Gross Earnings			
Electric	$ 9,623,747.77	$ 8,026,300.81	$6,477,210.55
Gas	4,397,716.52	3,741,762.65	3,422,386.10
Heating and water	246,789.06	170,167.49	130,889.55
	$14,137,453.35	$11,439,080.15	$9,430,486.20
Operating Expenses, Rentals and Taxes	9,935,681.07	7,917,668.67	6,154,719.77
Net Earnings	$ 4,201,772.28	$ 3,522,060.48	$3,275,975.43
Interest and Other Charges	5,112,969.49	1,686,822.97	1,549,115.59
Net income available for depreciation and Dividends	$ 2,388,812.79	$ 2,532,217.51	$1,726,859.84

Acquisition of the Michigan Light Company enables the company to supply electric light and power in addition to electricity to Jackson, Saginaw, Bay City, Flint, Port Huron, Alpena, Manistee, Royal Oak and Birmingham, in addition to serving approximately 2,000 industrial plants, the company, on December 31, 1920, had more than 175,000 other customers located in 99 municipalities in twenty-nine Michigan counties.

*For comparative purposes, operating results of the Michigan Light Company acquired in February, 1920 are combined with the Consumers Power Company's figures in this report for preceding years.

GROWTH OF BUSINESS

Electric:	1920	1919	1918	1917	1916
Sales in K. W. H.	372,182,902	257,441,424	214,562,424	204,456,962	251,454,831

SOURCES OF REVENUE

Municipal, Residential and Commercial Lighting	42%
Motor Car and Allied Industries	9%
Electric Railways	9%
Boiler and Machine Shops	6%
Food Products, Woodworking & Furniture Companies	6%
Miscellaneous Power Users	19%
	100%

CONSTRUCTION

The demand for electric service has grown so rapidly, particularly during the last few years, that it was necessary to carry on an extensive construction program in 1920. Additions and improvements also were made to the gas and electric distribution systems. Water sites and flowage lands were acquired. The expenditures for such purposes amounted in the aggregate to over $6,000,000, the larger part of which was for the electric system.

CONWAY TO LEAVE LANSING

The many friends and acquaintances of Joseph M. Conway, deputy commissioner of the Michigan banking department, will be surprised to learn that he has resigned his office, effective June 15, to become connected in an official capacity with a Detroit bank, announcement of which will be made shortly.

MOHRMANN AND LAMB MOVE UP

Banking Commissioner Hugh A. McPherson is authority for the statement that Harry O. Mohrmann, chief examiner of the state banking department since March 1, 1920, will become deputy commissioner upon the retirement of Joseph M. Conway, June 15, and that Scott E. Lamb, an examiner, will become chief examiner to succeed Mohrmann. Both of these men have been connected with the department a long time.

BANKERS O. K. TOWNSEND BILL

A resolution was unanimously adopted by the Michigan Bankers' Association, in convention in Detroit, this week, indorsing the Townsend bill now before Congress which provides for a national roads commission and federal aid in building trunk line highways.

C. R. WILSON DIVIDEND

Directors of the C. R. Wilson Body Company, Detroit, have authorized payment on July 1 of the regular quarterly dividend of 1¾ per cent upon the outstanding preferred stock, to stockholders of record June 20.

And He Too Was Called

He had been named as executor in the will of a dear friend—recently departed.

He had done much work in settling the estate. Much was still to be done.

Then the unexpected happened. He too was called suddenly—with the task unfinished.

Confusion resulted. Work already done had to be traced. Books had to be checked. Another administrator had to be chosen to finish the work. The wife and children were put to additional trouble and annoyance. The estate was delayed months in settling.

Such complications cannot occur when a trust company is the executor. Individuals may fail, but the work of a trust company, composed of many experienced individuals, goes on uninterrupted by mishap or death.

The Union Trust Company because of its thirty years of service is particularly well fitted to serve you in such matters of almost sacred trust.

We will send you useful literature on wills and executorships or we will gladly talk with you personally and in confidence.

Due to members—reserve account	1,656,581	1,655,609	1,858,774
Other deposits, including foreign government credits	31,466	33,024	91,876
Total deposits	1,720,390	1,705,356	1,957,395
F. R. notes in actual circulation	2,751,299	2,784,804	3,127,284
F. R. bank notes in circulation—net liability	142,493	144,831	161,282
Deferred availability items	445,087	414,929	609,298
All other liabilities	20,585	19,757	76,947
Total liabilities	5,434,689	5,379,760	6,195,809
Ratio of total reserves to deposit and F. R. note liabilities combined	67.4%	57.6%	*42.8%
Ratio of gold reserves to F. R. notes in circulation after setting aside 35 against deposit liabilities	71.5%	71.7%	*46.9%

*Calculated on basis of net deposits and F. R. notes in circulation.

Banks and Bankers

TWO NEW LANSING BANKS

Application for a charter for the Bank of Lansing and the Industrial Bank has been approved by the state banking commissioner. The Bank of Lansing is to be capitalized at $200,000 and the Industrial Bank for $50,000. It is understood that both institutions will be managed by the same association. Fred Affeldt, an employe of the banking commission, is back of the new organization. He has severed his connection with the commission.

NEW BANK AT TEMPERANCE

A movement is on foot at Temperance, Mich., to organize a state bank. Subscribers are all residents. A private bank recently failed at Temperance.

A. I. B. CONVENTION PLANS

Arrangements have been made to entertain more than 1,000 delegates at the annual convention of the American Institute of Banking, in Minneapolis, July 19-22. Not all the subjects for discussion have been decided upon, but among the speakers will be the following:

W. D. Simmons, associated Simmons Hardware Companies, St. Louis; E. W. Decker, president of the Northwestern National Bank of Minneapolis; John H. Puelicher, president of the Marshall & Ilsley Bank, Milwaukee, and vice-president of the American Bankers' Association; A. A. Crane, vice-president of the First National Bank of Minneapolis; Charles Donnelly, president of the Northern Pacific Railway Company; Joseph Chapman, founder of the institute's oldest chapter and vice-president of the L. S. Donaldson Company, Minneapolis; Dr. Walter Lichtenstein, foreign trade advisor of the First National Bank, Chicago, and D. C. Wills, of the Cleveland Federal Reserve Bank.

There will be a symposium on foreign trade lead by Dr. Lichtenstein. Departmental conferences will be held by ten groups on the following subjects: Advertising and publicity, auditing and accounting, bonds and investments, business development, collections and transits, credits, foreign exchange and foreign trade, mutual savings banks, office management and trust functions.

PONTIAC MERGER COMPLETED

Formal consolidation of the Pontiac Commercial and Savings Bank with the Oakland County Savings Bank took place May 31. All the officers of the former continue in their present capacities and Fred W. Perry, new president of the latter bank, becomes a vice-president of the consolidation. The former Oakland County Savings Bank will be continued in its present offices as a branch until a new building is erected.

Michigan Bond Items

At a meeting of the Hillsdale common council, Monday, June 6, an ordinance for the issuance of $16,000 bonds for the resurfacing of Howell street was passed. It provides for $8,000 in bonds for Hillsdale Paving District No. 2 in denominations of $500 each, bearing interest at the rate of 6 per cent, from Nos. 1 to 16 inclusive, taking date of July 1, 1921, and covering the city's share of the cost of the pavement. The bonds will be due as follows: Nos. 1-4, July 1, 1928; Nos. 5-8, July 1, 1929; Nos. 9-12, July 1, 1930; Nos. 13-16, July 1, 1931. To cover the portion to be paid by the property owners, sixteen bonds on the same terms will be issued as follows: Nos. 1-2, July 1, 1923; Nos.3-4, July 1, 1924; Nos. 5-6, July 1, 1925; Nos. 7-10, July 1, 1926; Nos. 11-16, July 1, 1927. Interest on both sets of bonds to be payable semi-annually on January 1 and July 1.

Union school district of Flint has sold $2,560,000 of 6 per cent bonds maturing serially, to Halsey, Stuart & Company and others. These are being offered to yield from 5½ to 6 per cent.

The Harris Trust & Savings Bank, Chicago, and Elston & Company have purchased $3,000,000 of three-year, 8 per cent sinking fund (closed) mortgage bonds of the Columbus Railway Power & Lighting Company.

UNITED LIGHT & RAILWAYS ANNUAL

The annual report of the United Light & Railways Company is at hand this week. We give the following excerpts therefrom:

CONSOLIDATED EARNINGS STATEMENT

12 months ended Dec. 31, 1920	
*Gross earnings (all sources).....	$11,950,518.55
*Operating expenses (including general and income taxes).....	7,884,518.62
**Maintenance of property.....	816,745.81
Net earnings	$ 2,375,251.51
Interest on subsidiary Co. bonds, notes, etc., owned by public.....	700,646.70
Dividends on Subsidiary Co. pref. stocks owned by public.....	159,986.00
Earnings of Subsidiary Co. applicable to common stock owned by public	12,525.40
	2,292,094.41
Interest on 1st and ref. 5% bonds U. L. & Rys. Co.....	455,424.22
Balance	1,926,860.18
Interest on 6%, 3½ yr. bond secured gold notes, series A.....	37,252.25
Interest on 7%, 5 yr. bond secured gold notes, series B.....	105,000.00
Interest on 7½, 1 yr. bond secured gold notes.....	96,122.45
Interest on 7%, bond secured gold notes, series of 1920.....	102,396.03
Interest on 8%, 10 yr. bond secured gold notes	14,980.36
Interest on 10 yr. convertible gold debentures	130,000.00
Balance	1,470,896.69
Interest on commercial loans.....	47,112.61
Credited to surplus account.....	$ 1,423,784.08

Net earnings applicable to dividends last three fiscal years after deduction of taxes: 1919, $1,033,-112.07; 1919, $1,038,767.72; 1917, $1,304,871.01.

*Gross earnings and operating expenses of the subsidiary companies include inter-company transactions to the amount of $1,593,081.55, of which $444,811.78 represents electric power sold to subsidiary railway properties.

**In addition to amount set aside or expended for maintenance of property, a further sum of $335,292.14 was set aside for depreciation and credited to depreciation reserve.

"Gross earnings of your company's subsidiaries show a very material increase, and due to careful buying and close attention to operations the net earnings also show a substantial increase; in fact, your board is gratified in presenting in this report to you, the most favorable statement of operations in your company's history. The year 1921 will not be without its problems, but it will be the policy of your management in the period of readjustment through which the world, and especially our country, is passing to be eminently fair in the matter of wages with its employes; conservative in the purchase of supplies, and economical in the expenditures of money."

"Due to the conservative policy of deferring dividends on the common stock, the cash resources of your company have been substantially augmented, and on December 31, 1920, the 'Surplus and Reserves,' after charging off property placed out of service, showed an increase of $623,070.69 over December 31, 1919."

GROSS AND NET OF SUBSIDIARY COMPANIES

	1920	1919
Gross	$11,797,450.59	$9,951,185.03
Net	3,118,221.65	2,666,622.77

Miscellaneous Stocks

(Owing to the fact that many of the stocks quoted below are not listed on any recognized stock exchange, from which authoritative figures are obtainable, these quotations must be considered as nominal. We endeavor to obtain figures from reasonable sources but do not assume responsibility for their correctness. It should be borne in mind that prices for many stocks which are closely held are apt to vary widely on sale.)

POLISH REMITTANCES FACILITATED

The Guaranty Trust Company of New York, through its Detroit correspondent, Howard B. Lee, advises that his company has been appointed fiscal agent for the Polish government and that funds which are to be transmitted from this country by Poles to their relatives abroad may be handled through this New York bank in a manner which will remove much of delay and danger which has been incidental to sending funds to Poland.

CARROLL S. JONES DIES

Carroll S. Jones, cashier of the G. W. Jones Exchange Bank of Marcellus for more than 40 years, died Monday of this week of valvular heart disease. He helped to organize the bank. For many years he was a leader in banking circles of Southwestern Michigan. Beside the widow he leaves a daughter, Donna V. Jones, who is assistant cashier of the bank, and a son, Carroll B. Jones.

THURMAN RECEIVER REPORTS

Morton H. Luce, temporary receiver for Allen G. Thurman & Company, has presented a report in circuit court of Kenty county placing the liabilities of the concern at $278,704.58 and assets at $65,887.43, according to Grand Rapids advices. It is also reported that four actions asking for recovery of property alleged to have been wrongfully converted by the company have been instituted by former customers.

M. P. A. TOUR NOTICE

Directors of the Michigan Pikes Association announce that the number who can be taken on the tour is limited this year and therefore urge all intending participants in the jaunt around Lake Superior in July to send in applications to Secretary Willard K. Bush, 1220 Book building, Detroit, as soon as possible.

FOREIGN REPRESENTATION

Announcement

We wish to announce that Mr. Samuel J. Hoexter, of S. J. Hoexter, Inc., will shortly sail for Europe to open trade connections in Germany, Austria, Czecko-Slovakia, Holland, Belgium, Norway, Sweden and Denmark for American manufacturers.

Mr. Hoexter is open to represent manufacturers in a few additional non-competing lines. He will also undertake a limited number of commissions to purchase European products for shipment to this country.

He will be pleased to hear from business men interested in bringing their products to the attention of foreign buyers with a view to establishing European connections.

TWO D. U. R. DECISIONS

Two decisions, one in favor of the Detroit United Railway, and one against the company, have been rendered in suits instituted in connection with fare increases and the municipal street railway.

In the first case the Michigan supreme court upholds the decision of Judge Mandell to the effect that the sale of part of the $15,000,000 railway bonds to the city sinking fund commission is not illegal and that no injunction can issue. The bonds thus sold have been resold by the sinking fund commission. The D. U. R. contended that the railway commission had no right to use taxpayers' money for the railway.

The second decision dismisses the suit of Pontiac, Birmingham, Farmington, Orion, Oxford and Rochester, brought against the D. U. R. to prevent the charging of split fares in interurban service under the Smith act of 1919. The petitioners for an injunction contended that the Smith act abrogated the franchise requirements.

FOREIGN CORRESPONDENCE

We present the following information furnished by Samuel Montagu & Company, bankers, London, under date of May 12 with reference to the business situation in Great Britain:

Bank rate 6½ per cent, since April 28th, 1921. Easy conditions and rates have characterized the money market during the last week and borrowers have satisfied their requirements at from 4¼ per cent—5 per cent, with balances at the close of business obtainable at lower rates. Weekly fixtures continue at 5 per cent. Discounts have been a quiet market, three months bills are quoted 5⅛—5 9/16 per cent. Receipts from Treasury Bills for the week ending the 7th instant totalled £85,543,000 and payments for the same period £81,080,000.

An increase in the gold in hand	Fcs.
A decrease in advances to the state	"
A decrease in notes in circulation	"
Ratio between bullion and notes in circulation	

The Board of Trade returns for April show a substantial shrinkage in value when compared with those for April, 1920, the reduction is partly attributable to the fall in prices and to the dislocation of industry caused by the coal strike, of which the full effects will be more fully reflected in the figures for May.

	April, 1921	March, 1921	April, 1920
Imports	£69,995,504	£93,146,434	£187,154,309
Exports	59,887,585	86,808,981	106,351,693
Re-exports	8,522,662	8,888,005	20,467,419

As compared with April, 1920, the most noteworthy reduction in the imports of raw materials during April, 1921, is in raw cotton, which is less by £28,962,920, and in exports of cotton goods which are lower by £21,376,562. Exports of woolen goods are less by £6,013,120.

	Four Mos. 1921	Four Mos. 1920
Imports	£292,558,274	£697,474,548
Exports	287,654,371	491,795,112
Re-exports	36,771,109	92,567,042

The Department of Overseas Trade gives the following figures, comprising entire notice of increase of nominal capital filed at Somerset House during April, 1921:

1921	Number of Companies	Total increase of capital	Average per company
April	159	£ 5,627,456	£ 40,756
March	149	5,397,286	38,233
February	159	13,407,896	85,401
January	198	10,790,413	54,497
	645	£35,252,552	

The April figures included £1,425,000 for oil, £737,600 for coal, electricity, gas, etc., £512,475 for metal industries, £437,500 for textile and dyeing; for foodstuffs, agricultural and dairy produce, £329,000.

Unfortunately there is no improvement to record as regards the coal strike. Its disastrous consequences are being increasingly felt, more factories are closing down and great numbers of workmen are being thrown out of employment. It is stated that not less than 100,000 tons of foreign coal are lying in the Thames. It is not surprising that many industries are giving increased attention to oil as a substitute for coal.

BANK OF FRANCE RETURN

The return of the Bank of France for the week ending today shows the following changes:

	12th May, 1921	6th May, 1921
Gold	261,000 Fcs.	3,569,707,000 Fcs.	3,569,481,000
Silver	250,000,000 "	28,450,000,000 "	28,700,000,000
Bills	91,159,000 "	38,741,680,000 "	38,232,839,000
Ratio		14.99%	14.90%

The Economiste Francais gives the figures for French foreign trade for the first quarter of 1921 as compared with the corresponding period of 1920:

Imports	1921	1920
Foodstuffs	Fcs. 1,168,417,000	2,571,375,000
Materials for industry	2,690,850,000	4,292,402,000
Manf'd goods	1,420 040,000	2,513,783,000
	5,329,307,000	9,377,460,000
Exports		
Foodstuffs	524,429,000	416,566,000
Materials for industry	1,292,911,000	1,071 642,000
Manf'd goods	2,241,041,000	2,798,777,000
Postal packets	369,097,000	220,746,000
	5,428 488,000	4,505,732,000

Excess of exports over imports for first quarter in 1921 is 129,181,000 francs, in same period of 1920 imports exceeded exports by 4,871,728,000 francs.

BANK OF ENGLAND RETURN

MORTGAGE INVESTMENT BANQUET

Salesmen of the Michigan Mortgage Investment Company, Lansing, held a meeting and banquet at the Hotel Kerns, June 3, with Glenn R. Munshaw, president of the corporation, as master of ceremonies. This corporation is capitalized at $2,500,000 and is one of the largest in the state, with several thousand stockholders. It was reported that the last issue of stock is being subscribed for liberally, being pro-rated among the stockholders.

$90,000 STOCK SALE ON

The Prodncers & Consumers Company, Cheboygan, recently incorporated for $400,000 and approved by the state securities commission, this week began the sale of $90,000 of common stock. The concern will handle farm produce and dairy products direct from producer to consumers in Cheboygan and in Detroit.

NEW INVESTMENT BANKING HOUSE

The H. Widre Company is a new investment banking house which has just opened offices at 504 Congress building, Detroit.

BUSINESS GAINS 10 PER CENT

President J. C. McCullough, of the Auto Owners' Insurance Company, Lansing, reports that the first half of the year has shown an increase in business of about 10 per cent. The company has more than 500 representatives in the state.

Michigan Bankers in Convention

(Continued from Page 4)

commerce, and we will increase that activity just in proportion as we relieve business of the tax burden under which it is today struggling. We must not forget that reasonable relief from taxation still leaves business with problems which will require constructive genius for their solution.

As to Foreign Trade

"Our foreign trade situation is one which calls for immediate and thoughtful effort on the part of our bankers and business leaders. The unsettled balance of trade in our favor of upwards of four billion dollars is becoming a menace rather than an advantage. Based largely on short term credits, a large part of which have gradually worked their way into our banks, we now discover that these are not being liquidated and a large part of this vast balance is fast becoming a fixed and permanent loan. The term 'frozen credits' has been given commercial and industrial loans based on over-extended stocks and inventories, but it may to be applied to the large foreign credits which are being carried by the banks in our principal ports of entry. There are only two possible ways of liquidating these obligations; one by such increase in our imports and decrease in our exports as to throw the balance of trade against us; the other, by establishing long term credits abroad through the War Finance Corporation, or through the establishment of foreign trade financing corporations under the Edge act. That we have come to a deadlock in our exports, especially of manufactured products, is evidenced by the storing of vast supplies of our merchandise on wharves and in custom houses throughout South American ports and the Far East. Very considerable amounts of this merchandise have been refused by the consignees which will entail large losses by American manufacturers. How to bring order out of the chaos now existing is very largely a problem of American finance. Because of our position today as world bankers, we have a responsibility which we must assume, whether we invite it or not. There are 30,000 banks in this country, and the most effective way to handle this foreign situation is by pooling their interests. The Federal Reserve Act, through the Edge law, which is an amendment thereto, offers the opportunity for banks to join together in the organization of banks to engage in foreign banking business. There are seven such banks in operation today, with an aggregate capital fund of thirty-five million dollars, dealing in short term credits only, and the Foreign Trade Financing Corporation is being organized with $100,000,000 capital to deal in long term credits.

"It would be better to solve this problem by the extension of credit, thus enabling Europe to relieve us of our surplus products of raw materials, and add to their own productive power. This would tend to keep trade and industry moving, both here and abroad, and solution of the world's ills of today can come only through production, and every agency which will tend to promote industry and increase production is a part of the work which should have our unqualified support, and will be to our undoubted benefit.

"America may not have sought the commanding position which she now occupies in world finance. That she has attained it, and that it has brought with it a distinct responsibility to American bankers, is a fact which we cannot for one minute overlook. That responsibility does not rest on a few, but must be shared by every American banker if he is alive to his full duty.

"America is no longer isolated. It never has been and never will be sufficient unto itself. For thirty years we have exported one-half of our cotton, one-third of our copper, one-fifth of our wheat and one-eighth of our forest products. To cut off those exports would mean bankruptcy to the South, the closing of our copper mines, 80-cent wheat and stagnation in our lumber industry. The present very noticeable check in our exports of these products has brought about conditions which should bear forcible evidence of what further is in store for us if we do not make it possible for Europe to take the surplus products of our farms, mines and forests.

"What is true of raw materials also applies to that vast field covering the production of American industry. Our manufactured goods, covering a wide range, have found an ever increasing market abroad and American products are known in every quarter of the globe. We need these foreign markets. In fact, industry as a whole must have those markets or limit its production correspondingly lessen its employment of labor.

Michigan's Position

"To what extent the depression of the last six months is due to the contraction of our exports abroad would be difficult to determine, but that those exports during the last four months have been but little over half the total of the corresponding months of 1920 is a fact, and a fact which cannot be disconnected with the slowing down of industry in this country and the curtailment of employment. Michigan is far removed from the seaboard, but it has a very intimate relationship to this problem. Detroit is a port of entry, and with one per cent of the population it has during the last year contributed five per cent of the country's exports. The product of Michigan industries reaches every civilized country in the world. Our imports have come from every corner of the earth. We have but to refer to some of the simplest daily needs of all our people to realize the interdependence of the nations of other, and in many cases, distant lands. Our tea from China, coffee from Brazil, china from England, linens from Ireland, glass from Belgium, are only a few of the innumerable articles of import which enter into our daily life. On the other hand, the market abroad for our products has increased six-fold since 1912. The war has brought about tremendous and far changed condition, but whatever may be its cause, we find ourselves today the biggest factor in the world's trade, and we could not, if we would, evade the tremendous responsibility which goes with that new relationship.

"The Great War, because of its very magnitude, required more than four years for its settlement. The problems growing out of that war for the same reason will take many years for their solution. In fact, the generation in which we move will not see the world returned to a normal condition. After previous world wars years elapsed before even the strongest recovered from their effects. We were impatient over the war's delays; we are impatient over the delays in reconstruction. We can rest content at this point, however: that each day, each month and each year will record a condition of betterment. It is now two and one-half years since the Armistice, and we seem to have made slow progress; yet if we could make a true comparison between conditions as they exist today, socially, as well as economical, and conditions as they existed two and one-half years after the Revolution, the War of 1812, or the Civil War, we would recognize that we have little cause for complaint, and we would have renewed faith in our institutions and in the ultimate justice and reward which comes from right thinking and the adherence to high ideals, whether it be on the part of an individual or a nation."

William J Gray, chairman of the educational committee of the Association, told the bankers that a series of talks on the fundamentals of banking had been prepared by the American association which were being prepared for distribution to all the banks, and stated that it was the committee's desire that wherever possible these papers be used by bankers on all occasions where the school children could be reached.

Mr. Drum's Address

Herbert F. Johnson, Kalamazoo, chairman of the committee on taxation; cited the dangerous tendency of legislatures to add to tax burdens at a time when the public was calling for decreased expenses, and gave it as his personal opinion that unless the business men of the country paid careful heed to the tax increases, troubles would speedily develop which were likely to make the past business troubles nothing in comparison. It was his recommendation that the business now dangerously near becoming a law at Lansing should be considered in this light by the Association. The matter was referred to the resolution committee for action.

The principal address of this session came next, John S. Drum, president of the American Bankers' Association, and also president of the Merchants' Trust Company of San Francisco being the speaker. He opened by supporting vigorously the sentiments expressed by President Slater in regard to the duty which every individual owed to the country to make a careful analysis of the present business situation with the object of determining what each could do individually to solve the newest world problem which has become our legacy by the war. He followed this introduction by a comprehensive review of the part which foreign trade played in the business life of our country before the war, pointing out that the natural flow of our surplus products and goods to Europe was counterbalanced to a large degree by large imports and invisible items of credit settlements which took care of themselves without much concern to us. Following which he drew a picture of the upsetting of this automatic equilibrium by the war and explained with unusual clearness how normal relations one with another became reversed or entirely changed until we reached that point where three or four billions of unpaid exports got lodged in our Eastern and other seaport banks. Then eventually came the crisis due to the complete dislocation of the machinery for the exchange of goods in the normal way until "the foreign world *could* not buy and the domestic world *would* not."

Following a review of the effects of the shutdown last year, Mr. Drum made it plain that the cost of production must come down to permit our normal economic flow to proceed. He is of the opinion that all basic agricultural products this year will be handled at a profit because of the lowered costs to the farmer, but stated that so far deflation had not been equitable to all classes and therefore more adjustment must follow, for which additional time, patience and effort would be required.

But notwithstanding the ill effects evident these several months of deflation, and the unevenness thereof, he says "we are going down naturally" and that "the inexorable law of economy will grind this thing out whether we like it or not, slow but sure." And after showing how the problem of reviving foreign trade was much different and more difficult now than formerly, he pointed to the only available solution, namely, the process of investing freely abroad. He advised his hearers that Europe might soon offer securities guaranteed jointly by private individuals, municipalities and even by states, which would be available in exchange for our surplus natural products and goods, and which, if we accepted through the

Digitized by Google

medium of debentures issued by the Edge act banks, would readily open the door to the return of prosperity. In conclusion he made the pointed query: With Michigan's surplus of manufactured goods and its bountiful excess of exportable raw and natural products, "is it not the duty of Michigan to take the lead?"

A. B. A. Meeting

Returning to routine Association business matters, President Steley announced the members of the nominating committee, which are as follows, with the first named as chairman: Wm. T. Moore, J. Edward Roe, E. N. Smith, W. T. Phelps and J. C. Hicks. On the resolutions committee he appointed Gerrit J. Diekema, W. F. Gallagher and Gus Hill, and on the auditing committee, Irving H. Baker, L. Z. Caulkins and Russ Jenks.

Members of the American Bankers' Association got busy following the regular session and after most minute instructions from Chairman Diekema proceeded to elect, a la James T. Keena, (1) a member of the Executive Council to succeed Dudley E. Waters; (2) a vice-president for Michigan to succeed Mr. Diekema; (3) a member to serve on the nominating committee, and (4) an alternate member of the latter. The chair appointed Gus Hill, Herbert Johnson, A. J. Maynard, Charles Adams and William Warmington as a committee to nominate members for the four offices and simultaneously with their appointment they made their report and the ayes had it in a walk, the same being as follows:

Member of Executive Council, Vernon T. Barker, president, Home Savings, Kalamazoo.

Vice-president for Michigan, John W. Haarer, vice-president and cashier, City National Bank, Lansing.

Member to serve on nominating committee, Walter G. Nicholson, too well known to waste type on.

Alternate member on nominating committee, Paul J. Ulrich, Mt. Clemens, ditto.

Delegates from the Upper Peninsula who are accustomed to cold breezes and several from Detroit who don't ordinarily take off their B. V. D.'s until July, plus several newspaperman and other convention encumbrances, partook of a pleasant ride on the Britannia to Wyandotte and Ecorse. A free ride is always good, was a guessing contest concerning a gold fish bowl full of pennies. Miss Gertrude Cramer, daughter of Otto P. Cramer, cashier of the Holland City State Bank, was the lucky one who became thereby the winner, the actual number in the bowl being 2,254. Some guesses were as low as 350 and one was 10,000. Miss Kramer was awarded the bowl and the pennies therein as the prize, which was presented by Robert B. Locke, who made a masterful presentation speech and incidentally pointed out that no doubt Miss Cramer's accuracy in estimating (she being an employe in her dad's bank) was due no doubt to the fact that her dad's bank is a member of the Federal Reserve. Side line commentators allowed that Locke had thus advanced a new reason for membership.

Detroit banks worked the convention Monday in two shifts. The night crowd held the meetings at the Statler and night shift went on the boat ride, except President Staley and a few others, who doubled.

Tuesday's Proceedings

At the Tuesday morning session Allen Walker, of the Guaranty Trust Company of New York, substituting for Willis H. Booth, who had been scheduled to speak, gave the bankers a most lucid explanation of the foreign trade situation and pointed out why we as a nation must either develop outside markets for our surplus or change our whole domestic scheme of living. Hal H. Smith, who followed, took issue with Mr. Walker, declaring that we should give first attention to home problems and the ethics of dealing with our fellow men before going feverishly after outside business. Mr. Smith declared most emphatically that if getting foreign trade meant impairment of the standard of living of the American workingman, he was in favor of making foreign trade secondary.

Unfortunately, the counsel of the Association rather missed the point stressed by Mr. Walker and thus confused two issues in the minds of his hearers, both of which are vital to the best interests of the nation and not necessarily conflicting. Nevertheless Hal Smith's arguments in favor of a more careful inquiry into whether our ethics of living and our ethics of business treatment of one another were well taken. He also went into the theory of taxation and pointed out inequalities which have cropped out in late years and emphasized the necessity of maintaining equitable taxes assessed according to benefits received, and of preserving to all the people the right of private property.

Mr. Smith referred to the unfairness of the proposed income tax under consideration at Lansing and traced the theory of taxation back many years, showing that income taxes seldom hit all classes alike. He estimated that exclusive of school taxes about 90 per cent of taxes go to maintain property which all the public gets the use of, and that the support and cost of maintaining taxes is not paid by the individuals who use it in proportion to the use and benefits they receive therefrom.

The increasing tendency of city and government to go into competition with private enterprise was deplored by the speaker, who pointed out that when an investor buys a tax exempt municipal bond which is put out by cities for the purpose of building roads, etc., the investor unconsciously is encouraging more government in business than the reverse.

Mr. Locke Speaks

At the afternoon session the bankers heard Robert B. Locke, of the Detroit branch of the Federal Reserve Bank, whose address was entitled "The Present Day Bankers' Responsibility to the Bankers of the Future."

Mr. Locke expressed the opinion that fully 90 per cent of the future bank executives of the country are at present in the employ of the banks, and endeavored to bring home the existence of a duty to see that these employes receive the right kind of training in banking.

"The greatest word in the development of young bankers is 'why,'" he said. "The 'why' of yesterday is not the 'why' of today under changing economic conditions, and the capable bank clerk should keep in touch with the reasons therefor, so that when his time comes to assume part of the management of the bank he will be abreast of the times."

Mr. Locke then reviewed the change of thought among bankers regarding this important subject since the American Institute of Banking was organized, and gave some interesting facts about the growth and achievements of the Institute.

Ruston Rasumussen, former editor of the Oriental Review, Bombay, India, reviewed the political situation in India and gave his hearers some views which were refreshing. He said: "I am no apologist for Great Britain and neither is the Indian government a heaven on earth, but on the whole the British rule has been a blessing to my country." He added that those who painted a picture of British autocracy and frightfulness in India were wrong; that during the war England withdrew all its troops from India and had the people wished to secede that they had a splendid opportunity at that time; that Great Britain had transformed a country that three centuries ago was constantly in internecine strife into a land of peace and content, which was an achievement without parallel.

"India's answer to those who talk of Indian hate for England," he said, "was 1,200,000 Indian soldiers in the British army during the war and a gift of one billion dollars from the Indian treasury."

Professor David Friday, of the University of Michigan, gave one of his usual fascinating

Plowing With Pen and Ink

(*Continued from Page 10*)

was drawn, particularly for a large amount, the bookkeeper was notified and the transaction recorded. What he proposed to do was to prevent the immediate entering of the withdrawal he intended to make.

He entered the bank and drew $4,500, explaining that the business deal had been consummated. Then he went outside and called the teller who paid him on the telephone and, impersonating a relative or a hospital attendant, notified the teller that a relative had been seriously injured in an automobile accident.

The result was, if the crook's expectations worked out, that the teller suffered a serious metal disturbance and complete banishment of immediate details concerning his business. The teller called a substitute, forgot to mention the withdrawal of $4,500 from an account and hurried out. As he left, the crook re-entered the bank, and presented another check for $4,500. Reference to the books showed the account to be equal to or over the amount of the check and the second check was honored. In this case the bank was victimized for $4,500, while the crook doubled his stake.

Much the same method is used in bond thefts and sneak thieving in banks. It is a good thing for the average banker to assume that every hour of the day there is at least one crook standing around in his bank watching an opportunity. In large banks where guards are used, loitering is impossible but the clever crook does not need a great deal of time to survey the general interior of a bank. What he is looking for is loose money or bonds lying within easy reach.

This stunt was worked in a Detroit bank: Two men entered. One stepped to the cage of a receiving teller to deposit some money and get a bank book. The other approached another receiving teller and discussed the details of opening an account. On the counter near the first teller, who happened to be a woman, was a package of bonds. The second man finished his conversation, went out to a nearby telephone and called the woman teller. The woman used the telephone near her, but the conversationalist on the other end complained that he couldn't hear, so she went to another phone some distance away. The crook who was talking to the other teller slipped the package of bonds inside his coat and left the bank. His bad to be nimble-fingered and at the same time keep the other teller's attention diverted, but he succeeded.

Many persons know how difficult it is to cash checks if they happen to be a stranger in a city, or to a bank, whether they are honest or not. The crook also knows that and often he plans for weeks to build up identification against the day he intends to put through his worthless paper.

T. J. Mowery, who has been working banks and individuals since 1910, with occasional vacations in prison, makes a specialty of the cashier check scheme. He will open accounts at different banks in a city for weeks his checks will be passing back and forth through these banks. When he has established identity he will put through cashiers' checks made out to "cash" and depart with the proceeds. Sometime ago he bought Liberty bonds with a hogus cashier's check.

Another method used to obtain Liberty bonds gratis is the bank letter scheme. The operator will deposit some money in a bank and study the tellers carefully. If possible also he will make the acquaintance of an official of the bank. When conditions seem to be right he will go to the bank and buy Liberty bonds, depositing a check for collection, explaining that in a day or so he will have his bank in some other place send a cashier's check on his account. Later he goes to the bank and asks if there is a letter for him. There is such a letter and from it he takes a cashier's check and "pays" for the bonds. This scheme was successfully worked on one bank and the crook obtained a $1,000 Liberty bond and seven $100 Liberty bonds.

Larkin J. Flannigan, using the names of Wallace, Sharp, Birchfel and Farnsworth, has worked thirty-one banks from New York to San Francisco successfully by representing himself to be an official of a corresponding bank. One job netted him more than $9,000. He knows banks, bank officials and banking practice and usually uses drafts to which he signs some bank officer's name.

The check-kiter often is a check thief as well. He may obtain employment where he believes he can steal a check book or perhaps checks that have been made out. He may forge checks or he may merely raise them. One operator of this character always obtained employment as an elevator boy and robbed mail boxes. One pair of crooks, a man and woman, made considerable money before they were caught. The woman obtained employment where she could steal checks, which she turned over to her pal to raise or fill out and sign with the name of her employer.

Fake telephone calls, faked letters on printed stationery, stolen checks, pay vouchers and a host of other facilities and materials are used by forgers. Ed Farden worked a bank near Detroit with a bogus check drawn on a regular voucher form with all the necessary signatures. On it was printed: "For back pay of differential of 5 cents per hour in accordance with the United States Railroad National Agreement Rules." It was drawn on a bank in Denver, Colo., against the Colorado & Southern Railway Company and signed by the shop superintendent. All the names were clever forgeries.

The American Bankers Association maintains a protective department and employs the Burns agency to handle its cases throughout ths country. Other banks employ the Pinkerton agency and many use the services of both. The following cases are taken from the records of the Burns agency:

Pretended business transactions often pave a smooth road to the confidence of bank officials and the money drawer. Of course the operator must be plausible, know the subject he is dealing with and have some ready capital to display or use. The operations of a Jew and an Italian working together illustrates this method. One visits some retail store and offers to sell merchandise below the prevailing market price. This operator usually has a business card of some well known wholesale or manufacturing concern. The prospect of buying staple goods below the market quotations interests the storekeeper.

If he buys he is asked to furnish payment for at least part of the order in the form of a check to be sent with the order to the firm. Should the buyer refuse to make such payment, the operator asks for a check in return for cash. If this swap is made the operator turns it over to his partner, who is the "scratcher," and the check is raised to the highest amount it will stand, and cashed. All the operators wanted was the signature. If the buyer will not fall for the check trick, then this pair of crooks will actually deliver the goods ordered, trusting to getting a check which they can raise. Sometimes the check is not presented at a bank, but at some other store. It all depends upon the "lay of the land" whether the operators work a bank or some individual.

What is known as the "directory swindle" has been worked successfully in many cities. The operator, who is well-dressed and a good salesman, visits one or more banks with a sample directory, a volume of easy reference and a handy thing for banks to have. It contains names, addresses and telephone numbers of persons and firms with which the banks are doing business constantly.

The swindler informs the banks that all he wants is to get their aid as distributors, and that he proposes to sell advertising space outside of the banks and then either give the books to the banks gratis, or sell them at a nominal figure. Having obtained the approval of the banks, the operator proceeds to sell advertising where he can, cashing checks where currency is not paid to him. If possible and not too risky the operator will raise the checks. No directory is published and the advertisers are out whatever they paid in.

Another method frequently used usually involves the purchase of an automobile. The operator goes to a dealer, shows a card of a business concern he pretends to represent, and which is usually prominent enough to attract attention, and negotiates the purchase of a car. The operator then goes to a bank recommended by the automobile salesman or dealer, uses his name as reference and deposits $100 or so in cash. Later he presents one or more checks drawn on a bank some distance from the city in which he is working, and signed either by an official of the firm he claims to represent, or by some bank official. These checks are bogus as is the automobile deal. Identification was all the operator desired.

One crook has a scheme whereby he visits a prominent hotel and lets it be known he is a revenue officer hunting down narcotic peddlers. He makes it a practice to get acquainted with some young fellow to whom he offers a job as revenue officer. If the man seems to want the job the operator explains that it is necessary to get a complete history of the applicant, which should be written out and signed. If the history is provided, the operator visits the applicant's home and supplies himself with all the information possible, especially concerning the financial standing of the family. With this information and an original signature the swindler is able to forge one or more checks, often trusting to his new-found friend for the necessary identification before presenting the forgeries.

Even the movies furnish a lead for the clever forger. For instance, one worker visited a city as the manager of the Fox Film Company and announced that scenes were to be taken there for a serial. Some local talent was to be used, and contracts were made with young women in the city. Having established identity, the operator then presented cashiers' checks signed by an official of the film company. When the operator was out of sight and sound the checks were discovered to have been forged.

Alexander F. Johnson, alias Donald Hammond, representing himself as the son of a wealthy man, and looking the part, sent a forged order from Boston, Mass., to Lawrence, Mass., for several thousand dollars' worth of Liberty bonds, saying in the order that he would come after them. Later he visited the Lawrence bank, presented his credentials and obtained the bonds from an employe who was none too keen. No bonds were ordered by the man impersonated and the bank lost heavily in the deal.

A crude but successful scheme was worked by a journeyman tailor who made it a practice to seek employment in some tailoring establishment and remain long enough to form a partnership, the purchase of which was to enable him to use the partner's name on forged checks.

Henry Ford's name is synonymous with wealth and opportunity and James Edward Francis Barter, alias James R. Blake, alias J. D. Barker, used it to good effect representing himself to be Mr. Ford's secretary. His scheme was to "scrape" acquaintances in hotels with any likely victim, create confidence by promising valuable tips on Mr. Ford's numerous enterprises, and use the friendship thus made as a means to cashing forged checks. He opened an account in Boston and cashed phony checks on a Detroit bank. This operator was arrested in a New York hotel just as he was about to be entertained at the theater and later at dinner by an unconscious accessory.

Another variety of the same scheme was worked in a Detroit hotel by one of Mr. Ford's unofficial secretaries, who gained the ear of a hotel guest from up-state and unloaded considerable "inside stuff" about Ford stock, the nature of which aroused the guest's cupidity to the extent that he entrusted some hard cash with his affable friend to invest in Ford securities. Apparently the secretary must have forgotten about his promise in the confusion of his secretarial duties, for the "gull" never has received the gilt-edged stock.

William Manchester, snappy business man with more business to do than you could shake a stick at, blew into Trenton, Mich., and called at a bank to get the names of building contractors. He did not over-play the part, either. Then he looked up the bank's real estate man and arranged to buy two lots. He stayed long enough to establish confidence and get the real estate man's help in cashing a few worthless checks on a Detroit bank.

T. J. Mowery and Thomas H. Sheppard were a clever pair of actors until they were cast for parts in the chain gang. Mowery took up his abode in Tulsa, Okla., and Sheppard established himself in St. Louis. Mowery brought suit against Sheppard for $10,000 and hired lawyers to handle the case. The plan was to get a settlement out of court, to which end the lawyers worked so successfully that Sheppard gave in and sent his checks for the $10,000, which were cashed. They were worthless, of course, but the details of how they were able to get away with such a bald trick would be most interesting, if obtainable.

Impersonation is basis of all forgery but often the crook carries this impersonation further than mere duplication of handwriting. Beard J. Dupree, alias Mortimer A. Katz, young and good looking enough easily to pass for a fast young scion of good family, had it all figured out that, inasmuch as he could not be a real son of wealth, he would pretend to be one. He deposited money in a San Diego bank, and, learning that the bank had a branch at Coronado, he telephoned to the branch, representing himself to be an official at the main office. He told the manager of the branch that a wealthy depositor named Dupree had a son who was "going the pace," and had considerable money in his own right, but that he would appreciate it if the branch would not honor the boy's check for more than $3,000 at a time.

Later the swindler appeared at the Coronado branch, identified himself as Dupree, the pace-making son, and said he was going to put one over on his dad and draw out some money. Dupree drew a trifle less than $3,000 on a forged cashier's check and got away before the trick was discovered.

CHILE COPPER REPORT

Gross operating revenue of the Chile Copper ompany and the Chile Exploration Company the year ended December 31, 1920, is reted as $17,712,020. In 1919 it was $10,350,. The surplus is $151,999 but after certain ustments a deficit of $349,718 is reported

(*Continued from Page 31*)

talks and interjected ome predictions, to the delight of the bankers.

The Association adopted resolutions: (1) opposing a state income tax as likely to "promote extravagance instead of conserving expenditures;" (2) advocating limited trust powers for state banks, and (3) urging bankers to exhibit the same spirit of unselfish helpfulness and co-operation which animated them "during the darkest hours of the World War." Three thousand five hundred dollars was subscribed by the bankers for the relief of the family of Undersheriff Harry Worden, who was killed during the capture of bank bandits who held up the Farmers State Bank, Grass Lake.

Bice Elected President

Officers elected for the coming year are:

President, E. S. Bice, First National Bank, Marquette.

First vice-president, H. H. Sanger, National Bank of Commerce, Detroit.

Second vice-president, B. P. Sherwood, Grand Haven State Bank.

Secretary, Mrs. H. M. Brown, Detroit.

Treasurer, J. Edward Roe, American State Savings Bank, Lansing.

Counsel, Hal H. Smith, Detroit.

Members of the Executive council for two years: Everett Whitney, Traverse City State Bank; V. W. Tourje, Alpena County Savings Bank; O. W. Riches, Exchange Savings Bank, Mt. Pleasant; R. C. Stone, St. Johns National Bank; George Wiley, Wayne County and Home Savings Bank, Detroit; Frank G. Evans, Central National Bank, Battle Creek, and C. B. Edwards, First State Bank of Swartz Oak.

The bankers of Marquette invited the Association to hold its 1922 convention in that city and their invitation was accepted. Comment was to the effect that a boat ride would be indulged in on this occasion.

The agricultural commission of the Association, after reviewing the success of the Michigan State Farm Bureau, commented as follows in its report:

"In all our efforts to help the farmer, we have been confronting the very persistent fact that we need the farmer far more than he needs us. Agriculture will continue, no matter what happens to other branches of industry. It is true that at the present time the outlook in some respects is discouraging, because agriculture is being affected by the abnormal conditions which have affected business in general. But we need have no fear for the future of agriculture in this country. Agriculture will not only continue but it will be profitable, because if the world is to have a sufficient and continuous supply of food, it must pay prices which will yield to the farmers a proper reward.

"Michigan bankers are fully alive to the fact that their prosperity rests upon the prosperity of the farmers, and we feel sure they can be depended upon to join any practical plans of co operation which may be presented to them, whether originated by the commission or by the farmers themselves."

Plans Presented

The concluding feature of the convention was a playlet, in which the cast was as follows:

Speaker—Ben Vernor, cashier Merchants National Bank, Detroit.

C. D.—Albert Werner, Merchants National Bank, Detroit.

Miss Savings—Alex. Thompson, Merchants National Bank, Detroit.

Loans—F. J. Maurice, Federal Reserve Bank, Detroit.

Bank Examiner—Geo. L. Bott, Discount Department, Merchants National Bank, Detroit.

Ghost (John Skelton Williams)—J. G. Baskin, Federal Reserve Bank, Detroit.

It ran like this:

Enter Mrs. Commercial Deposits. (Tall and very thin.)

Speaker (bowing)—Have I the pleasure of your acquaintance?

Mrs. C. D. (stiffly)—I am Mrs. Commercial Deposits.

Speaker—Mrs. Commercial Deposits, I am so glad to meet you. Do you live in the city?

C. D.—Yes, I reside in the Financial District.

Speaker—How exclusive! Won't you sit down? You do not look well. You appear thin.

C. D. (ignoring the request)—Thin! I am wasted away! I am suffering from reconstruction.

Speaker—That must be that new disease called Fiscitis, which I understand is the antithesis of Gastritis. (Sympathetically) My dear woman, how much have you lost?

C. D.—At least 25 per cent.

Speaker—Oh, dear me! you are in awful shape.

C. D.—Eminent authorities assure me I will soon see marked improvement.

Speaker (feelingly)—I am sure you will. Why, hell! They cannot always be wrong.

Miss Savings Deposits runs in and grabs her mother's skirt.

Speaker—Why, who is this?

C. D.—This is my daughter, Savings Deposits.

Speaker—Miss Savings, I am delighted to meet you. (Looking at her closely) Is she on a diet, too?

C. D.—Yes, she is trying to subsist on unemployment.

Speaker—How terrible!

C. D. (sadly)—She seems to grow worse daily.

Speaker—Why don't you give her "Easier Money Pill?" That is very nourishing and palatable.

C. D.—I have tried to get that for the last four months, but although its virtues has been promised daily, it never comes.

Speaker—Why don't you try the F. E. store? I am sure their stock is never exhausted.

C. D.—Who runs the F. E. store?

Speaker—A group of men called Financial Editors.

C. D.—I will go there tomorrow.

Speaker—Why not today? Tomorrow will be another story. (Turning to Miss Savings) What is the name of your dolly?

Sav.—Profits.

Speaker—"Profits"—what a lovely name!

Sav.—Yes, my uncle named her. He says it means so much.

Speaker—Why how is that? (Takes the doll from her and holds it up) Because she is so small?

Sav.—Yes, that is it. Her full name is B. D. Profits.

Speaker—B. Y. D. Profits? Abbreviated Profits?

Sav.—No, No. B. D. Profits, Bank Deposit Profits.

Speaker—O-oh. Who is your uncle?

Sav.—He is a rich banker and has banks in Grand Rapids, Lansing, Saginaw, Flint, Battle Creek and Kalamazoo.

Speaker—How did he come to think of that name?

Sav.—He came home one night looking all tired out, and when I asked him to name my dolly he looked at her and said, "Call her Profits, B. D. Profits."

Speaker—Has she grown any since?

Sav.—I think she has, but uncle says "No!" very positive like. Look, Mama, there is Auntie! (Runs to her and takes her hand.)

Enter Mrs. Loans.

Speaker—Why, why, who are you?

Mrs. Loans—I am Mrs. Loans.

Speaker—Mrs. Loans, I am more than glad to meet you. You look so well-nourished.

Loans—Yes, I am a bit uncomfortable. You may not believe it, but I study reducing daily. I only wish I could change places with some of these theorists.

Speaker—Have you seen a doctor?

Loans—Yes, I wait on him constantly. He is the noted Dr. McDougall of Chicago, and has a branch office in Detroit. His assistant here is Dr. Locke, late of Boston.

Speaker—I have heard of him. I understand in the state they think he is somewhat brusque—a bit outspoken. Judging by the bone he pulled, he must be an osteopath.

Loans—No, not an osteopath nor a homeopath, but an honest-to-goodness allopath. He prescribes awful doses for me, and although he believes me I soon regain all I have lost. His great cry is restriction.

Speaker—Restriction! Restriction of what?

Loans—Restriction of loans.

Speaker—Impossible! How heartless!

Miss Sav.—Oh, Mama, look—a poor blind man.

C. D.—(Turning to Mrs. Loans.) Why, it is the Bank Examiner all terribly bound he is!

Speaker—Conditions are certainly terrible. Here we have (pointing to east in turn) reconstruction, unemployment, inflation, and now blindness. (Turning to Bank Exsaminer) How did you lose your sight.

Bank Ex. (sadly)—Searching for a 2 for 1 statement.

Speaker—How very sad! And the task so hopeless!

Bank Ex.—They give me no hope. My present boss is most kind, but—becoming greatly agitated—rises—listens intently—and says, "Who do I hear coming?"

Miss Sav.—Look! Look! A Ghost! Oh, Mamma, hurry. (Drags her mother from the platform. Loans helps the Bank Examiner and they all hurry from the room. The ghost follows with stealthy tread.)

Constructing Equipment

TOOLS AND SUPPLIES AT REASONABLE PRICES—
SUBJECT TO PRIOR SALE—STANDARD MAKES
AND IN FIRST CLASS CONDITION.

We are winding up our work in this territory and will sell at a sacrifice the following

Air Compressors—Ingersoll-Rand, 6x6.
Boilers—40-70 h. p.
Cars—Standard gauge flat; Kalamazoo Push; 24-in. Kopel double truck flat.
Conveyors—Woods belt sand and gravel; Alvey-Ferguson roller gravity.
Cranes—Brown hoist 15-ton, extra buckets; booms; outrigging.
Hoists—37 h. p. Flory; 30 and 37 h. p. Lidgewood; Clyde No. 106 steam.
Lumber—No. 2 yellow pine 4x4, 4x6, 2x8.
Mixers, Concrete — ½ yd. Smith tilting; No. 1 Jaeger.
Mixer, Mortar—3 Buckeye gas-driven.
Pumps—3-in. Suction, gas-driven diaphragm; Knickerbocker 4-in. suction, gas driven, on trucks; No. 1-8 Gilbert & Barker, gas-driven; Novo; 10 h. p. 4-in. centrifugal on truck.
Office Equipment — Flat-top desks; typewriter desks; card files; Burroughs adding machine, hand and motor-driven; comptometers; typewriters: L. C. Smith and Underwood; check-writers, etc. Stromberg time clocks and equipment.
Steel Reinforcing—½ in. to 1¼ in. square and round.
Towers—Insley 100-ft. heavy steel, booms; hoppers; chutes; frames; gates; ladders.
Tractors—1-30-70 h. p. 10-ton Holt caterpillar.
Trailers—Troy No. 3 reversible extension type; troy 2½-yd. bottom dump.
Trucks—G. M. C. 2 and 3-ton dump; 1½ and 2-ton stake.
Woodworking Equipment — Saws, tables, etc.
Miscellaneous — Small tools and stores stock, nails, etc.

Convention Combings

The new state banking commissioner, Hugh A. McPherson was on hand Monday afternoon and acquired one or two new friends. Only reason he didn't make more new friends was that everybody seemed to know him already. Fine chap.

S. S. Roby was conspicuous by his absence.

Henry Robinson and Ray Maynard each underfook to represent solely the East Side and West Side of Saginaw, respectively.

Boyce Dansard won a brown derby twice on 934.

Some played 943 by mistake, and lost.

Fred S. Case, Sault Ste. Marie, greeted many old friends and made the trip a double header by taking in the Michigan Pikes Association meeting Sunday. Fred is president of the latter and signed up several bankers for the July tour around Lake Superior.

Ben Vernor, of the Merchants National, was chairman of the entertainment committee and showed rare form. He was ably assisted by Mac Browning; George B. Judson, who wasn't there Monday; Sam Kingston, T. W. P. Livingstone and Laurence P. Smith.

The Grand Rapids National City scored its sixteenth successive homer when it distributed its splendid 1921 Michigan bank directory to the delegates.

Former Senator William Alden Smith and former Governor Sleeper were both in attendance, the former of the two formers looking ten years younger than formerly.

It was the unanimous opinion that this convention was a record-breaker in all respects—attendance, enthusiasm, inspiration, education and fun.

Ben Vernor, chairman of the entertainment committee, composed a little skit anent the present business situation which was acted out on the ball-room platform to the great delight and amusement of everyone except financial editors.

The note-books given out by the Dime as souvenirs proved not only attractive to look at but exceedingly useful to those who kept track of lucky numbers. At times it looked as if every banker was a reporter, judging from the number who were jotting down figures and comparing notes.

Tuesday developed additional lucky numbers as follows: 962-1116-1056.

Jack Daly, of the First and Old, said 934 looked like a meeting of the bond men's club at times.

K. Z. Potter, vice-president of the Jackson City, came down Tuesday with Mrs. Potter, but his father, N. C., was detained at home looking after his new poultry ranch.

W. C. McPhail got the prize for long distance dancing.

Doc Newland was there. Doc Newland is a former Detroiter but is now a New York banker. He granted interviews to several of the papers but in the main he maintained his characteristic seclusiveness. Said he had nothing to say concerning relief for the Near East but hazarded a conservative guess that New Yorkers would find much relief by attending Michigan bank conventions. Doc opened a new account in Jackson, and thus enlarged his par list.

Twenty Years in the Life of Charles E. Mitchell

(*Continued from Page* 11)

Company, which concern was making rapid headway when the National City Bank offered him the position of vice-president of the National City Company, an organization engaged in the sale and purchase of securities.

Again Mr. Mitchell seemed to consider connections with the largest banking institution in the country as offering greater opportunities than the buiness he was in, and he sacrificed a larger income and business independence to take the secondary position in the National City Company. This concern occupied small offices when Mr. Mitchell joined it, but in less than six months he had influenced its expansion and improved its service to such an extent that the National City Bank turned all its bond work over to the company.

It is said that Mr. Mitchell was one of the first men in the country make the merchandising of investment securities an independent and important business. At any rate he developed the National City Company to the point where it had 50 offices in the United States, 1,500 employes, 10,000 miles of telephone and telegraph lines and representation in all the important European countries. This achievement of a man still in his youth, vigorous and extremely popular, made him the one man to succeed James A. Stillman as president of the National City Bank.

Mr. Mitchell is described as a methodical, democratic and dynamic personality, able to impregnate others with his boundless energy. Those who have worked with him declare that his influence spreads throughout any organization he is connected with. He has understood the value of good health as essential to success, and one of his methods of keeping fit is to walk five miles daily to his office. A certain portion of each day is devoted to his two children, Rita, a girl of eight, and Craig, a boy of four. He loves home life, is fond of golf and gardening.

A friend who visited his home found his young son with a pair of work gloves on and covered with soot and grime, following the furnace man in the prosecution of his duties. Mr. Mitchell remarked that he was training his boy to like work and dirt so that he would not grow up a snob because he lived in Fifth avenue

A Foreign Advertising Adventure

(Continued from Page 8)

the results seem to justify our decision.

Quite regardless of its merits from a propaganda standpoint, the simplicity of our copy plan commended itself from a purely practical standpoint. In the first place, it permitted considerable condensation where only limited space was available. It was not so complicated but what it could be embodied in the kind of simple, direct phraseology that was most likely to be comprehended by the average reader. It combined the minimum of possible complications when the question of translation came up. Let me say that our copy, also, has undergone changes and modifications from time to time. The general idea, however, has always remained the same.

With the list and the copy out of the way, the size and extent of the campaign came up for consideration. In this, too, our decision was based on our practice in domestic advertising. We have always been believers in regular and continuous advertising, as opposed to variable and irregular advertising. Our foreign campaigns have always been consistent and regular. We have taken the amount of money available for advertising in any given country and spent it in the largest, consistent, regular campaign that it would buy, the amount of money available limiting the maximum size of space; common sense and the determination of what was necessary to command attention limiting the minimum size of space. For example, generally speaking, we prefer one half pages in a monthly publication to six full pages. This is not an entirely good example, because other considerations might affect our procedure; but I am sure that you get the idea.

So much for the fundamentals of our present plan of foreign advertising and what preceded and led to it. But there are other little side issues that are almost as important as the fundamentals themselves. Take the matter of what constitutes eligibility in a publication for inclusion in our list. We have found that, considering the limits of a modest appropriation, the best results are obtained from publications of general circulation, locating their circulation, insofar as may be, among the classes most likely to purchase our goods. This is in the nature of advertising first principles and requires no elaboration. Where general publications of proper character are not available, we are driven to something more local. We have no objection to the more localized publication, such as newspapers, except that the use of them usually involves the expenditures of a great deal more money than is available. More of them have to be used. While they may carry our message closer home, and spread it more liberally, we cannot afford, nor do we need in normal times to cultivate our foreign market thus intensively and extensively.

We must be borne in mind that we are not producing goods exclusively for the foreign market. A certain volume must of necessity be maintained at home. The intensity of our foreign merchandising must be determined by the quantity of our goods that we decide to allot to the foreign field.

A foreign advertising appropriation is not an easy thing to determine. We are not entirely satisfied with our method; but this is it. We base our total advertising appropriation, domestic and foreign, on the amount of goods we plan to produce in a given year, influenced and modified by the amount of sales resistance we expect to encounter, and we allot to the foreign field, generally speaking, an amount in proportion to the number of units we plan to sell abroad.

There is one question which may be in the minds of some of you, the answer to which I did not consider in its proper place because it seemed to break the continuity of the discussion, and that is this: "Are you not, by financing your big foreign advertising campaign out of your own pocket, encouraging your foreign distributors to lie down on their end of the merchandising job?" We are, unless steps are being taken to counteract the influence. Those steps are being taken. We are telling our foreign distributors that our advertising in their respective territories is in the nature of general reputation-building propaganda, such as we carry on in this country in our magazines of general circulation; and that they, too, like our domestic distributors, must see to it that their immediate local markets do not remain uncultivated. We are suggesting, and that suggestion is rapidly developing into a demand, that they spend in their territory a sum equal, if not greater, than we spend in that same territory. While our advertising is opening up and developing their market in a broad, general way, their advertising should be cultivating and re-cultivating that same market. We are meeting with a marked degree of success and I predict that when things open up again abroad in a big way we shall be able to do infinitely more than we have done in this respect.

—An address before the recent National Foreign Trade Convention in Cleveland

251 ST. AUBIN AVE. DETROIT, MICHIGAN

Consumers Power Wins Grand Rapids Suit

An attempt on the part of the city of Grand Rapids to hold the Consumers Power Company to certain advertised rates not provided in a city ordinance failed when Judge M. L. Dunham, in superior court, Grand Rapids, denied the city's application for an injunction restraining the company from putting new rates into effect. One question was whether an ordinance intended to regulate the exercise of a franchise granted by the state constituted a franchise, and another was whether the company's advertised rates, not provided in the ordinance, nevertheless should hold under the ordinance.

Judge Dunham ruled that the ordinance was not a franchise and there was no provision in the ordinance making the advertised rates obligatory.

In 1907 the Grand Rapids-Muskegon Power Company, now the Consumers Power Company, provided for a low power rate with a minimum of $1 and an eight-cent straight lighting rate in a regulating ordinance. The ordinance was passed by the city council of that year but a few objectors petitioned for a referendum vote, which was taken at the same time the company advertised that it would try out a schedule of rates of eight cents for the first thirty hours, six cents for the second thirty hours and four cents per kilowatt for all power exceeding the second thirty hours. Special rates were made on power.

The attention of the voters was called to the advertised rates, rather than to the eight-cent straight rate provided in the ordinance upon which the citizens were voting. The company continued to charge the advertised rates until 1918, at which time the costs of producing power became so heavy that the company notified the city council that the eight-cent straight lighting charge in the ordinance would be adhered to.

The city threatened to cut the street car fares if the company changed its lighting charges, and as a cut in fares would have been more disastrous than the advantage to be gained by increasing lighting rates could overcome, the company withdrew the proposed increase. In July, 1920, the company again notified the city council of the need of an increase in rates and also of more power facilities. The council granted increases in lighting and power rates, but later rescinded them. The company then notified the city that it would return to the eight-cent straight charge provided for in the 1907 ordinance. The city immediately filed application for an injunction.

The fact that the company refused to have the trial rates of eight, six and four cents included in the ordinance, but merely advertised them as voluntary with the company, while the ordinance provided for the eight-cent flat rate, Judge Dunham accepted as evidence that those rates were not covered by either a franchise or any ordinance.

ESTABLISHING TRADE RELATIONS

Trade relations for Michigan manufacturers and European customers, as well as for exporters seeking Michigan markets, are to be established through the efforts of Samuel J. Hoexter, Detroit, who will sail in July. He will visit Germany, Austria, Holland, Sweden, Norway, Belgium, Szecko-Slovakia and Denmark.

Mr. Hoexter is head of S. J. Hoexter, Inc., Detroit, and has been working to establish business in products classified under the mechanical trades. He is working to build up imports on products that will not compete with American manufactured goods. He now represents European producers of small tools, hardware novelties, industrial chemicals, dental and surgical instruments and watchmaking instruments. He will be able to arrange for importation of all kinds of products needed here, the supply of which was interrupted by the war.

Mr. Hoexter said recently that England and France were already well established in the business centers of their former enemies and that sentiment must be set aside in planning reestablishment of trade.

11½ WAGE CUT ACCEPTED

Employes of the Lansing city water and electric light board have accepted a reduction of 11 per cent in wages, believing this to be in accordance with the decrease in the cost of living. The Lansing municipal power plant has been paying the highest wages of any such plant in Michigan except those of the Detroit Edison.

DOW REPLIES TO COUZENS

Replying to Mayor Couzens' suggestion that rates on steam and electric power should be reduced, Alex Dow, president of the Detroit Edison Company, informs the mayor that the company's books are open for inspection at any time and the city officials can see for themselves whether a decrease in rates is possible at this time. Under an existing ordinance the council has the right to fix rates on heating, but as it has not done so, the rates announced by the company are legal, Mr. Dow says. Access to the company's books never has been denied the city authorities, Mr. Dow reminds the mayor.

BRYANT ELECTS PAGENSTECHER

The board of directors of the Bryant Paper Company, Kalamazoo, has elected Felix Pagenstecher, general manager, to the position of president, succeeding the late Frank H. Milham. Mr. Pagenstecher will continue to perform his former duties and it is stated that no other changes in personnel will be made.

New Corporations

FOR WEEK ENDED JUNE 4, 1921

Wyrick Register Corp., Detroit; to manufacture, buy, sell and otherwise dispose of and deal in autographic registers, adding machines, etc.; Carl Carda, Mrs. Mary Hammurmann, 4240 Belvidere Ave., Fred Blaskal, Detroit 100,000

Union Co-operative Auto Service, Detroit, to sell gasoline, oils, automobiles, accessories and repair tires, automobiles and batteries; Paul J. Podolski, 8203 Moran St.; Peter H. Sundeman, August W. H. Gruman, Detroit 50,000

River Garage, Inc., Detroit; to maintain and operate buildings and garages for garaging, etc.; Frank H. Sloman, 155 Chicago Blvd.; Harry A. Sherndfelin, Edward A. Lovely, Detroit 50,000

Blue Mountain Lumber Co., operations at Timbo, office at Saginaw, to purchase, lease and hold lumber and convey timber lands and timber; Joseph A. Marx, Saginaw; Abe Lincer, Saginaw, Curtis A. Brothers, Timbo, Ark. 90,000

Mount Clemens Beverage Co., Mount Clemens; to manufacture cereal beverages and sell the same; George Tudworth, Mount Clemens, Charles B. Steck, 819 Howard Bl., Rodney A. Waterburg, Detroit 36,000

State Mutual Insurance Co., Flint, to buy, sell, trade and deal in all appliances, medals, fixtures and everything necessary in insurance; Hastings rods; William T. Lewis, Lansing; George Walker, Flint, Theodore Morehouse, Fenton 10,000

Marlette Oil & Gas Co., Marlette, to buy, sell oils, gasoline, and automobile accessories; Roy Abel, A. G. Admms, George Alexander, Marlette 18,000

Port Huron Press, Port Huron; to publish newspapers, books and other periodicals; general publishing; C. R. Oslus, Charles R. Oslus, Jr., Dr. A. H. Cole, Port Huron, Mich. 100,000

Regenerator Co., Detroit; to manufacture, distribute, buy and sell at wholesale and retail regenerators, carburetor heaters, etc.; Robert D. Newell, 407 Blaine Ave.; Frank T. Armstrong, G. E. Sayre, Detroit 15,000

Commonwealth Finance Corp., Detroit, to conduct general banking business for purchase and sale of stocks, bonds, etc.; Charles Sawyer, 160 Euclid Ave.; W. N. Parker Holden, David U. Hemle, Detroit 10,000

Watts Property Management Co., Detroit; renting, leasing, managing and maintaining real estate; to buy and sell real estate; George, Phyllisia, May, John D. and Willis Watts, 2065 W. Grand Blvd., Detroit 10,000

Simmons, Detroit, sale, who'esale and Retail, of candies, sweetmeats, soft drinks, tobacco, magazines, etc.; Rowe Bell and Russell J. Simmons, 146 Grand River Ave., Clarence Carr, Detroit 5,000

Gasoline Service Corp., Adrian, to buy and sell mineral oil and its products, Ella J. Moreland, Mary E. Moreland, W. H. Alexander, Adrian 25,000

Mayville oil & Gas Co., Mayville, to buy and sell gas and oil and automobile accessories, Edgar B. and Lloyd A. Cartwright, Jessie Coffee, Mayville 20,000

Commerce Realty & Investment Co., Monroe; Odette Parmentier, to purchase, hold, operate and sell securities and real estate, H. B. Beaver, Markle and Sidney Aves., J. H. Evans, A. A. Klinger, Detroit 30,000

Commonwealth Sprinkler Co., Grand Rapids, to manufacture, buy, sell, deal in, fit, repair, install and erect fire protection equipment; Fred D. Vos, John T. O'Brien, Freda A. Bosse, Grand Rapids 20,000

Engineering Specialties Co., Detroit, to manufacture, purchase, sell and exchange mechanical goods; Neville & Maclachlan, 2629 Ins. Exc.; Frank J. Wadecker, Floyd M. Walker, Detroit 25,000

Grand Chemical Products Co., Grandville and Grand Rapids; to manufacture and sell chemical products; H. A. Underhill, Grandville; Jacob M. Cohn, Stanley L. Burnett, Grand Rapids 30,000

Detroit Washing Machine Corp., Detroit; to manufacture, buy, sell or otherwise deal in washing machines, parts and accessories; Ruy J. Corrigan, Ada Corrigan, 55 Glendale Ave., Anthony B. Eggert, Detroit 500,000

Merchants Garage Co., Detroit; to conduct a garage; Frank E. Hunt, 1746 Kent general garage and automobile; Field Ave.; Paul W. Beals, Clara M. Hunt, Detroit 35,000

George F. Koppin Amusement Co., Detroit; purchase, sale, conveyance, leasing, owning, holding and dealing in land and buildings of every kind; George F. Koppin, 102 Stimson Place; John Covelesakie, Helen Schaeffer, Detroit 150,000

Ithaca Oil & Gas Co., Ithaca; to buy and sell at wholesale and retail kerosene, gasoline and lubricating oils; Guy C. Boyd, George Whitman, B. M. Coffin, Ithaca 35,000

Marx Stores for Men, Detroit; purchase, sale, tailoring and repairing of men's and boys' clothing; Ben; L. Marx, 81 Peterboro St.; Milton M. Alexander, Theresa Alexander, Detroit 10,000

Collins Asphalt Shingler & Paper Co., Morenci; to manufacture, buy, sell and deal in, wholesale or retail, all kinds of asphalt shingles and prepared roofings; W. H. Gates, William L. B. Collins, C. E. Cottrell, Morenci 20,000

CHANGES OF NAME

Zink & Young, Inc. (name changed to Keystone Stucco Co.), Detroit 10,000

INCREASES

Auto City Oil Co., Detroit, from $10,000 to 40,000

Angle Steel Stool Co., Inc., Otsego, from $50,000 to 85,000

Home-Maid Hosiery Mills, Bay City, from $15,000 to 40,000

Yellow Taxicab Co., Detroit, from $30,000 to 220,000

Sturgis Steel Co-Cart Co., (name changed to Sturgis Go-Cart Co.), Sturgis, from $500,000 to 2,150,000

Clairing Tool Co., Detroit, from $50,000 to 100,000

NOTICES OF DISSOLUTION

Reynolds Motor Car Co., Mt. Clemens 400,000
Bogardus-Ashley Grocery Co., Oxford. 6,500
Sol & Louis Gittleman Co., Lake View. 15,000

WILCOX JOINS MICH. INVESTMENT

Frank H. Wilcox, Jackson, who for the last seven years has been vice-president and manager of the W. B. Reynolds Company, with offices in Jackson, Flint and Detroit, has been elected vice-president of the Michigan Investment Company, Detroit. The latter is a corporation formed to take over the business of the Lambrecht-Kelley Company and its officers and directors are closely associated with the American Loan & Trust Company. For the last three years Mr. Wilcox has been handling Detroit property of the W. B. Reynolds Company and in his new connection will have charge of the real estate department.

F. H. WILCOX

SCOTT BILL FAVORABLY REPORTED

The Scott bill exempting Great Lakes shipping from certain provisions of the La Follette Seamen's Act has been favorably reported by the committee on merchant marine of the House of Representatives. This bill permits two watches instead of three where the run is twelve hours or less; two watches for the deck crew and three for the firemoon where the run is twelve to sixteen hours, and three watches for runs of more than sixteen hours. Ships on runs of six hours or less are entirely exempted from the provisions of the act. The percentage of able bodied seamen of the deck crew is reduced from 65 to 50 per cent, certificated lifeboat men are permitted and the season is extended to run from May 1 to October 15.

The Dupont-Motor Co. Company has declared the quarterly dividend on the preferred stock due at this time.

The American Chicle Company has deferred action on the quarterly preferred stock dividend.

The Chandler Motor Car Company has reduced its quarterly dividend from $2.50 to $1.50 a share. In connection with the action of the directors of the company, President F. C. Chandler issued the following statement:

"In our opinion, the last ten months have been the most trying in the automobile business. There has, however, been considerable improvement during the second quarter of this year.

"It has been our policy since organization to pay dividends consistent with our earnings, always having in mind the necessity of maintaining a strong cash position. We enjoy such a position today and in order to maintain it, the directors have ordered a dividend of $1.50 per share. When normal business conditions shall have returned, the company will undoubtedly pay dividends commensurate with its improved earnings."

The International Harvester Company announces the reduction of its dividend rate on the common stock from 7 to 5 per cent. In the course of a statement the company says:

"Through the action of the directors in dropping the rate to 5 per cent, the holders of this stock are brought back to their prewar rate of return. This 5 per cent dividend on the common stock amounts to only about 2.9 per cent, on the whole amount which holders of this stock have invested in the business, and this lessened cash return comes at a time when money is worth more than in pre-war days, the current bank interest rate being 7 per cent."

HIGHWAY CONVENTION DATES

The annual convention of the Michigan State Good Roads Association will be held in Lansing August 30 and 31 and September 1.

PROSPECTING FOR OIL

Financed by a Detroit concern in which P. A. Thrasher, Detroit, is interested, Fidwell Brothers, California, have begun prospecting for oil in Markey and Foster townships, Roscommon and Ogemaw counties.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Michigan's New Corporation Act

A Digest of Changes Made by the 1921 Legislature, Together With an Official Ruling on Report Dates

FOLLOWING the enactment of the recodified corporation act by the Michigan legislature, John L. Lovett, general manager of the Michigan Manufacturers' Association, asked for an interpretation of the clause providing for the filing of reports. The law specifies that such reports shall be made in July or August for the year ended June 30. If this provision were enforced, corporations would be put to great expense in closing their books and filing returns, either after the fiscal year already had been closed, or before the regular time of closing. The interpretation made by the attorney general, and approved by Governor Groesbeck, provides that these returns may be made on the corporation's closing date nearest to June 30, and that reports already made for the fiscal year will be accepted.

The following digest of the changes in the Michigan corporation act, as enacted by the 1921 legislature, has been prepared by the Michigan Manufacturers' Association:

I

All corporations shall hereafter be incorporated under this act, unless expressly excluded. This act requires the articles of incorporation to state expressly under which section of Chapter 1, Part 1, such corporation intends to proceed. Manufacturing and mercantile corporations will proceed under Section 1, which provides for corporations carrying on any lawful business for pecuniary gain.

II

The term "capital stock" as defined shall be construed as meaning "capital stock as provided for in the articles or amendments thereto and shall not include surplus funds or undivided profit."

III

The articles of incorporation require the giving of the addresses of the main business offices, both in Michigan and outside of the state. This is more definite than the old provision in Compiled Laws, Section 9018, Paragraph 3, which said: "the principal place or places at which its operations are to be conducted." No name shall be used which will imply that it is a banking, insurance, surety or trust company.

IV

The total authorized capital stock is not limited in its amount, as under the former statute authorized capital stock was limited to $50,000,000. If non-par value stock is to be issued, the number of shares, if any, of this stock must be stated in the articles of incorporation. The value of non-par stock must be $1.

V

The articles of incorporation must now contain the names and addresses of the officers and directors chosen by the incorporators to act for the corporation for the first year, or, if no such officers have been elected, the name of the representatives or attorney in fact, authorized to act for such incorporators.

VI

The articles of incorporation shall be made out in triplicate and sent to the Secretary of State, where the original, after approval shall be filed. Upon the return of the other two properly certified articles, one will then be filed with the county clerk. The filing, franchise and certifying fees required by law shall in all cases accompany the articles.

VII

A foreign corporation having a similar name to another foreign corporation will not be precluded from using the same if the name of the locality is attached.

VIII

A corporation must maintain an office in this state but it is still provided that the meetings of stockholders and directors may be held without the state.

IX

The first meeting of stockholders shall be held not more than 60 days from the filing of the articles. No notice or waiver of this meeting is required as provided before under Compiled Laws, Section 9019 and Section 11330.

X

Any corporation may at any general or special meeting of the stockholders, with the consent of three-quarters of its capital stock, sell and convey all its property to any other corporation formed under the same or any similar law, and no notice is necessary as was formerly required for such a proceeding but the law now requires notice of the sale to be filed with the Secretary of State thirty days thereafter.

XI

The act provides, in Chapter 2, Part 2, Subdivision 2, under Sections 3, 3, 4, 6, 7 and 8, for the consolidation of corporations. Such consolidation may be effected between two or more corporations organized under this or any general law of the state by a vote of three-fourths of the legally issued capital stock of the corporation, at any meeting of the stockholders called to consider the question of consolidation. Notice must be sent by registered mail of such meeting, postage prepaid, to each stockholder, at least thirty days prior to said meeting. Special attention should be paid to these sections in view of any pending consolidation.

XII

As formerly provided, any corporation organized for pecuniary profit may purchase or hold shares of stock of other corporations having purposes similar to those of the purchasing corporation, organized under laws of this or any other state. The act now gives a statutory right to the corporation owning such stock of another corporation to hold the office of director and exercise the rights of an individual stockholder.

Upon the adoption of a resolution to extend the corporate life for a further term of thirty years, it shall be the duty of the president and secretary to make, sign and acknowledge in triplicate new articles, to which shall be appended a copy of such stockholders' meeting, certified by the secretary and verified by his oath and filed as required by this act for original articles.

XIV

This act provides that a voluntary dissolution may be effected by the stockholders without court proceedings but this right voluntarily to dissolve will not affect the right of any of the parties to accomplish the dissolution as provided in Compiled Laws, Sections 12563-13577.

XV

Within ten days after any corporation shall issue any of its capital stock in payment for property, it shall file a sworn schedule of such property with the Secretary of State. Any corporation may issue part paid stock in payment of property conveyed to it in which case the articles, and any certificate or statement required by this act to be filed with the Secretary of State with reference to the value of the property so conveyed, shall clearly state the number of shares so issued and the amounts credited upon such shares as partial payments thereon, in addition to the other statements with respect to such property's cash value. Such shares, so issued, shall be subject to such further call for the balance thereon due as may become necessary to the corporation or to its creditors as in other cases.

XVI

A provision permits the directors of any corporation to require bonds of such of its officers or employes and in such amounts as may be fixed and determined by such board.

XVII

The office of chairman of the board of directors is now specifically mentioned in the statute. One person may hold any two offices but those of president and vice-president. It is also provided by statute that an executive committee may be appointed when there are more than five directors. The wording of the Compiled Laws, 1915, Section 9023, is changed from "the directors may have the power to fill in a vacancy.....for the current year" to the following: "such appointees shall hold office until their successors are appointed at the next succeeding election."

XVIII

Amended articles shall be filed in the same manner as the original articles.

XIX

Every corporation under the laws of this state is required to keep a correct list of all its stockholders who are residents of this state,

Digitized by Google

together with a statement of the number of shares held by each stockholder, at their agency or office in this state, and such list shall be open at all times to the inspection of the Secretary of State or local assessing officer for the purpose of obtaining copies or other information required for public business. The failure to keep such a list is now a misdemeanor only and will not work a forfeiture of the charter. A transfer book need not be kept.

XX

Any exemption allowed in regard to the holding of the annual meeting of the corporation will not relieve or excuse any corporation from making and preparing a report of its condition and fiscal standing, which shall be made annually in the month of July or August, showing the condition of such corporation on the 30th day of June.

XXI

The preferred stock shall at no time exceed two-thirds of the authorized capital stock. This provision formerly read "shall not exceed two-thirds of the actual capital paid in." Shares of common and preferred stock shall be of the denominations of $10 or some multiple of $10 or of $25, but not more than $100. The amount paid in must now be 10 per cent of the subscribed capital instead of the authorized capital.

XXIII

Preferred stock may now be converted into common stock, bonds or other security, when formerly it was convertible into common stock only.

XXIV

In providing for the issuance of preferred stock the corporation may further provide that such stock shall, in addition to the dividend fixed therein, also participate with the common stock, in such proportions as the stockholders may agree upon and provide for in the articles, in any dividends which the corporation may at any time declare after there shall be declared and paid upon the common stock "for the current year" a rate equal to that paid upon the preferred stock. The phrase "in such proportions as the stockholders may agree upon and provide for in the articles" is a change from that in Compiled Laws, Section 9050, as amended 1917, which read: "which the corporation may at any time declare."

XXV

Certificates of preferred stock shall state the amount such stock is entitled to receive on account of such preference from the surplus assets of the corporation.

XXVI

If for any reason said corporation ceases business or becomes insolvent after payment of all liabilities and debts, the remainder of the assets shall be applied first in payment paid dividends due thereon, and the balance divided among holders of the other classes of stock as their interest may appear. "Among holders of the other classes of stock as their interest may appear" is a change from the of all stock preferred as to principal and uniformer provision in Compiled Laws, Section 9050, Amendment 1917, which read: "and the balance divided pro rata, share and share alike, among the holders of the common stock."

A two-thirds vote is required instead of three-fourths vote to amend the articles of association.

This act makes provision for the issuance of shares of non-par value other than preferred stock having a preference as to principal without any nominal or par value. Attention is called to the provision of this act relative to the issuance of shares of non-par value. This will be found in Part 2, Chapter 2, Subdivision 2, Sections 6, 7, 8 and 9. Nothing in these sections in regard to the issuance of such stock will exempt any corporation or the holders of such shares from complying with the provision of the Act known as the "Securities Act."

XXVIII

When a corporation increases or decreases its capital stock, the president or secretary shall make a certificate thereof and this certificate must show what amount of the total authorized stock after such increase has been subscribed. This is a substitute for Compiled Laws 9018, Section 9, Amended Act 254, 1917, which provides that at least 50 per cent of the total authorized stock must have been subscribed.

XXIX

Under the sections conferring on the corporation the power to borrow money, mortgage property or guarantee the debts of corporations, it is provided that a purchase money mortgage will not require the consent of two-thirds of the capital stock of the corporation.

XXX

The act makes special provisions for industrial stock. This stock may be sold to the employes of the corporation upon consideration of such faithful or continued employment as may be fixed by the voting stockholders. It is provided in this section that the corporation, with the consent of two-thirds of the capital stock, may authorize the expenditure of not to exceed 10 per cent per annum of its surplus capital for the purpose of providing for the social, moral, physical or educational welfare of its employes; and with the consent of all the capital stock, such amount may be increased to 25 per cent of such surplus. The statute expressly requires the directors to exercise good faith in their management.

XXXI

The stock of every corporation shall be deemed personal property and shall be subject to provisions of Act No. 103, Public Acts of 1913, known as the Uniform Transfer Act.

XXXII

The act provides that the Secretary of State shall compute or determine the amount of the franchise fee to be paid by foreign corporations before their admission to the state. Such corporation may be heard by a Board of Appeals as to the computation.

XXXIII

By-laws need not be filed with the county clerk. All articles, amendments to articles and all annual reports shall first be filed with the Secretary of State and copies there certified by him shall be filed with the county clerk.

XXXIV

All corporations organized for pecuniary profit shall file annual reports in July of August instead of January and February, showing the condition of the corporation June 30 instead of December 30. This report must contain the necessary information for the computation of the annual franchise fee. This report need not show the number of shares held by the officers and stockholders. The report shall be signed by the president or vice-president and the secretary or assistant secretary of the corporation, instead of a majority of the directors. The filing fee is changed from 50 cents to $2 and must be accompanied by the annual franchise fee.

XXXV

Any corporation whose act of incorporation has been repealed is subject to this act but the corporation shall have all its power and rights under the old acts and now mode of operation is to be imposed upon any existing corporation. A reincorporation or a renewal of corporate life can be accomplished only under the provision of this act.

Cogswell, Founder of American Solvay, Dies

ONE of the best known industrial enterprises in this country, and one which contributes essential materials to many other industries, is the Solvay Process Company, a corporation maintaining plants in Syracuse, N. Y., Hutchinson, Kas., and Detroit. The company takes its name from a process for obtaining soda ash from brine, which was developed by Ernest and Ernest and Alfred Solvay, of Couillet, Belgium. The founders of this enterprise in the United States were William B. Cogswell and Rowland Hazard. Mr. Cogswell, for many years a prominent figure in the mining and engineering professions, died at his home in New York, late last week.

The operations of the Solvay Process Company in the United States have been marked by a succession of triumphs in analytical chemistry and the salvaging of valuable commercial by-products from the one source—brine obtained from subterranean wells.

Soda ash was first produced commercially in 1800 by a crude and expensive method known as the Le Blanc process. As early as 1811 scientists were experimenting in an effort to develop a process more economical and efficient, but it remained for the Solvay brothers to find the key to the problem and originate an apparatus for the manufacture of soda ash by a reaction of ammonium bicarbonate and salt brine. This was in 1863. The first plant for commercial production was established in 1865 in Couillet. In succeeding years other plants have been built in Belgian manufacturing centers.

In 1881 William B. Cogswell and Rowland Hazard acquired the American rights to the Solvay process and built a plant which was established in Syracuse, where an abundant supply of salt brine was and continues to be found. From a small beginning, the Syracuse plant has been developed gradually until it occupies many acres of land on the shores of Lake Onondaga, where for miles great mounds in terrace formation and composed of the waste material from the retorts furnish evidence of the enormous amount of valuable products taken from salt water by the Solvay process.

Later, plants were established in Hutchinson, Kas., and Detroit, where also the prevalence of brine encouraged salt making. These plants have grown almost as rapidly as did the parent plant at Syracuse.

The soda ash industry belongs to that class of manufacturing which depends for its growth upon chemical research, and is almost as great in its own way as is the coal tar industry. To many manufacturers of other important products it assumes the importance of a key industry. While the principal product of the Solvay Process Company is soda ash, from this intermediate come caustic and modified sodas, calcium chloride, causticized ash, bicarbonate of soda, salt, paper pulp, limestone, all of which the Solvay plants manufacture.

These various by-products are used in the manufacture of soaps, chemicals, textiles, glass, enamelware and baking powder, and in oil refining and metal cleaning. Caustic soda is used in soap, mercerizing, the compounding of cleaning fluids and other chemicals. Calcium chloride is used in refrigerating machines instead of brine, and also as a dust-preventative on highways. Soda ash and caustic soda, known as causticized ash, is used in cleaning milk and soft drink bottles. It is good for cleaning metals before plating or enameling. The limestone is produced in pulverized form for agricultural purposes, and also as a substitute for gravel in the mixing of concrete.

How Increase Bond Distribution?

A Problem of Better Salesmanship, Merchandising And Advertising in a New But Profitable Market

—Perry in the Portland Oregonian
AN URGENT CASE WAITING

—Mutchson in the Chicago Tribune
THE GORGE IS OVER

—Harding in the Brooklyn Eagle
SWORDS OR PLOWSHARES

RETAIL BOND distribution today is a very different business from what it was ten years ago or even five years ago. Heavy taxation has driven the large buyer from the market as a purchaser of taxable securities (which is the type of securities with which we are most concerned in this discussion), while on the other hand war time prosperity, the Liberty loan drives and the unusual rates of interest which have prevailed for the last few years, have attracted a new bond buying class, the smaller investor, who is today a very large factor in the bond market.

A canvass of the average sale of the bond distributors here represented would, I am sure, show that their average retail sale of corporation bonds today is $3,000 or less. A similar canvass ten years ago probably would have revealed a figure at least four or five times that amount—possibly more.

Notwithstanding this tremendous change in the market many bond distributors have done little to accommodate their selling methods to present conditions. They maintain a tremendous overhead of expense in the form of elaborate offices, with complicated inside machinery for handling their transactions, and depend for distribution in large part upon the unsupported efforts of high salaried salesmen, who devote much the same time, expense and effort to selling the existing unit of sale as they did ten years ago when the sale and, consequently, the profit were several times what they are today. The expense of bond distribution has, in consequence, been mounting rapidly, which means either that corporations desiring capital must pay more for it to recompense the bond distributor or the distributor must see his already narrow margin of profit decline almost to the vanishing point. Neither is desirable nor necessary; for both alternatives, I believe, can be avoided by facing existing conditions squarely and adapting our methods of distribution to conform to them. The problem may be approached from the angle of (1) Sales; (2) merchandizing, and (3) advertising.

Let us consider them in the order named.

By A. E. BRYSON
Of Halsey, Stuart & Company

which, however, is not necessarily the order of their importance.

The large majority of bonds have been sold, and probably will continue to be, through personal salesmanship. The bond salesman deserving of the name is more than a salesman. He is a financial counselor, well trained, versatile, distinctly above the average—in fact, almost deserving of classification among professional men. He is a product of the $20,000 unit sale of years ago, and if he is to continue to be a profitable distributor means must be found for increasing his productivity. In short, his large unit sale of several years ago must be replaced by several smaller transactions, involving at least the same amount of profit. The old school salesman, in some cases, chafes under conditions which compel his attention to the smaller buyer. Some such are being replaced by a new type of salesman, who knows his subject as well as his predecessor, but who realizes the changed conditions that make more calls and easier effort necessary, and appreciates the necessity of the application of sales methods which have been found productive in other lines.

I am not sure, moreover, but that we shall have to go further. The farmer, for instance, may not be overly impressed by the carefully manicured city man with his precise necktie and carefully chosen diction. Maybe an equally well versed but "nearer to the sod" salesman, who knows the farmer's way of thinking, would assist in solving this difficult although potentially large market. So with the laborer. He may be awed by the pretentious equipage of the bond house and perhaps by that of its representatives. Maybe here a horny handed salesman, who had graduated from the ranks, might get by in this market where the prevailing type of salesman, even if he could be induced to give it consideration, might fail. So, too, with the foreign market, the woman's market, etc. Perhaps salesmen with more intimate knowledge of their requirements could show larger results than are now being attained.

To increase bond distribution I would, therefore, suggest that greater consideration be given to the type of salesmen employed and that more effort be made to adapt them to existing market conditions.

I shall have more to say later as to how advertising can assist in the solution of the sales problem, but at this point let me inject a few thoughts on one form of advertising that will do much to assist in its solution. I refer to correspondence. Aside from advertising well directed correspondence will do more than anything else I know of to increase the productiveness of our salesmen. While I expect to see an increasing volume of sales by mail, I question whether for some time to come any considerable proportion of bond sales will be so negotiated. It is in the field of co-operation with salesmen that correspondence work in bond distribution can be most productive.

Our sales problem today is to make as many of the calls of our salesmen as profitable as possible. While the unit of sale is smaller, the sales resistance to be overcome is about the same as before. We cannot, therefore, afford to use the time of high-priced salesmen in making the same number of calls to sell $3,000 of bonds that he previously employed in selling $20,000 to $30,000. The confidence, however, required on the purchaser's part to buy bonds can be instilled as well through well directed correspondence as through personal salesmanship; thus the number of calls necessary to effect a sale can be cut down through its use. Doesn't it stand to reason that a salesman's efforts can be made more productive if preceded by one or more carefully prepared sales letters, that his next call will be more productive if his last one is followed by a tactful letter, advancing the salesman's case, and that phone calls, an important agency in bond sales, can be made more productive if preceded by a sales letter?

Let us eliminate the foolish, wasteful, broad-

Digitized by Google

scale circularizing, which is also a relic of bygone days when buyers were few and much more experienced than now, and when they were perhaps capable of interpreting the maze of cold facts contained in the average bond circular. Let's hire some real correspondents, choosing them as we do our salesmen for ability in their respective line. Let's write more real and personal sales letters. Let's replace the unprofitable circularizing, which to many buyers has reached the stage of actual annoyance, with more effective and more concentrated sales letters. Let us study the sales-by-mail efforts of commercial lines, and if other means of distribution, which I may discuss later, are not forthcoming, let's reach the small town and country market, which in some sections is now largely closed to legitimate bond investment, as has the mail order house—by correspondence. It can be done with greater thought on the subject and improved correspondence methods.

The Merchandizing Problem

The word "merchandizing" is an overworded term in the commercial field, but an underworded one in the investment field. It has to do with the location of markets and methods of distribution. There was no merchandizing problem in the bond business a few years ago, for the market was then confined to a relatively small number of institutions—banks, fraternal orders, insurance companies, trusts and a few hundred thousand individuals who were known very largely to the various distributors, inasmuch as they were naturally the outstanding men of the community. These buyers were located, for the most part, in the older and more established states. The problem was not one of locating the market, nor of methods of distribution, for the salesmanship was about the only means employed. The problem was simply to break into the market, generally at some other dealer's expense, by getting business which that competitor had previously obtained by cutting in on some other fellow.

I have already indicated that this situation has changed. Actual buyers are now scattered from Maine to California, and potential buyers, because of the increased wealth of the country and the greater facility for distribution of the market with the merits of bonds, exist in every nook and corner of the country. The problem now is how to reach these buyers with profit to the distributor.

Your are familiar with the present distributing machinery. The majority of the large bond houses originate in the large cities, and where the accumulation of funds makes the handling of such transactions possible. These originators may be merely underwriting houses, with no distributing facility—they may be wholesalers, who distribute in large blocks to other dealers, or they may be both wholesalers and retailers. The bulk of bond distribution is among the latter class, those working conjunction with smaller dealers and banks with bond departments, which, by the way have increased in number very rapidly during the last few years.

I have already indicated some of the problems of retail distribution, which while applying particularly to the big city distributors, also have application to the dealer in smaller communities, not so much because of his cost of operation as to his more restricted market and slower turnover of capital.

Granting that a market does exist for bonds wherever there is a surplus of capital over and above the community's requirements (and this includes a very substantial part of the United States today), and granting further that the big distributors and the smaller ones as well, while aware of their larger market, are nevertheless confronted with a problem of cultivating it profitably, how can it be reached, for in it, of course, lies our largest possibility of increased bond distribution? I believe the answer at least in the country districts is, and it is my personal conviction only, through the country banker. The country banker has the plant, the staff, the knowledge of where the market lies in his community; and he ordinarily has the confidence of these potential buyers. Thus the selling expense, which is the problem of the larger distributor in attempting to reach this market, is reduced to a minimum in the case of the country banker. What the country banker lacks, however, is the inclination to undertake the distribution of bonds, because he thinks he is not properly compensated for his efforts; because he may not feel competent to pose as a bond salesman, or because he may have some local mortgages to sell, or for other reasons, which, while are, of course, his principal source of revenue, would suffer if he attempted to do so.

Space will not permit of an extended discussion of this topic, though I believe that any open minded country banker who opposes bond distribution can be convinced of the fact that his arguments are not altogether well founded. He need only look about him—the city banks, which are opening bond departments in an increasing degree, without affecting the growth of their savings deposits, or the experience of thousands of banks in all sections of the country during the Liberty loan campaigns, when despite bond purchases in unprecedented amounts, deposits increased enormously.

There is also another important thought on the subject—that of the banker's responsibility to his community. Bonds in lieu of bond deposits are not in the beginning sufficiently remunerative to make the undertaking one of large profit, still is not the business, as the bank commercial adviser, somewhat obligated to meet the competition of the everpresent blue sky salesman, with something more than negative arguments when he rendering sound banking advice when a customer, anxious to improve his income, questions him about a bond issue offered by a large distributor and he replies "I have no faith in it" as to keep his deposits intact?

For those who are really concerned about ways and means of increasing bond distribution, the country banker offers one of the largest opportunities as well as one of the most difficult problems open to the solution of this question. It is inevitable, I think, that in time he will become a distributor—just how soon depends largely upon the aggressiveness of those whose job it is to get him to see the light. There are some 30,000 banks in the United States, and the profits if all, or a substantial part of them, add facilities for the distribution of sound investments to the other machinery for the distribution of thrift and accumulation which they have offered for years.

Better Analysis Necessary

I have said that a market exists almost everywhere today for bonds, which is broadly true; yet of course, some sections offer larger possibilities than others. While we in the bond business are aware of this, our knowledge is gained ordinarily not through the scientific and systematic study of conditions, depended upon in other merchandizing lines in fixing their sales and advertising policies, but rather to somewhat haphazard and fragmentary information that comes to us from our salesmen or dealer connections and other such casual sources of information. So far as I know, only one investment house has conducted a comprehensive and scientific analysis of the possibilities of its market. To increase distribution, therefore, I suggest that we must, in this important respect, profit by the experience of other commercial distributors with whom our problem is not altogether unrelated.

We must also improve our operating methods, by which I mean the mechanical end of the business; the necessary detail in connection with the recording and handling of the various transactions. You appreciate fully the top-heavy clerical force now necessary to the completion of a bond transaction and the complicated machinery involved, which are in large part the outgrowth of an era which may have warranted such a system, but which today, under changed conditions, is as unwarranted as it is unsatisfactory.

Perhaps the situation is not altogether analogous, but if not, it is primarily due to differences in the customs of the trades, rather than to any actual dissimilarity of the problem involved, but to make my point clearer let us contrast the situation of the buyer of an expensive piece of jewelry with that of a counter purchaser of bonds. With the jewelry transaction, notwithstanding the fact that the profits involved are appreciably larger than on the bond transaction, the delivery machinery is infinitely simpler; with the completion of the sale the transaction is virtually ended, both for the buyer and the seller. The customer hands over his cash, takes his purchase and walks out and the jeweler turns his attention immediately to the next customer. The bond buyer, on the other hand, even in $100 units, probably gets delivery of his purchase the next day and only after the most intricate mumbling of elaborate clerical, recording and delivery machinery.

I am not here to discuss office methods, for my discussion has to do primarily with bond distribution. While I have, therefore, no concrete solution to offer for this situation, since distribution is certainly influenced by such an unsatisfactory situation, I submit the proposition that we must acknowledge the obsolescence of much of our existing machinery and replace it by simpler, quicker, less expensive and more satisfactory methods to meet existing conditions, and to reduce bond buying to a less complicated transaction, both for the buyer and for the seller.

The Partial Payment Plan

One other problem of merchandizing before I leave this topic—that of fitting our product to the purse of our market. It seems trite to say that there is an infinitely larger proportion of people in the world whose monthly surplus is $100 rather than $1,000 and again a much larger proportion whose monthly surplus is $10 rather than $100. While merchandizing in other lines have taken cognizance of this fact, we in the bond business have not to the extent that we should. A majority of all pianos, talking machines, sewing machines, washing machines, gas machines, and, I understand, automobiles as well, are today sold on the installment plan. In short, every facility is offered the man who wants to acquire what he desires on the installment plan, yet equal opportunity is not generally afforded him to acquire what is certainly more nearly an essential—sound interest bearing investments. You may say there is no analogy; the piano merchant operates on a much wider profit, which permits of installment payments, and there is body to your argument. Yet have we, as investment bankers, no responsibility to supplant extravagance with thrift and to thwart the peddler of blue sky securities, who you may be sure will offer terms to suit his buyer's pocketbook? And can we consider only the profit of the first transaction? Is the purchaser's repeat business not worth consideration? Is the advertising value of a walking representative, for such the partial payment plan purchaser is apt to be, of no value? Is he not that because of systematic saving the purchaser will become a larger and more consistent buyer of no moment? Suppose we only break even in dollars and cents on a partial payment plan, and on but the other considerations, a few of which I have suggested, sufficient to make the transaction in reality a profitable one?

We are considering means of widening our market. There is no better means available than through the wide spread adoption of the partial payment plan by reputable bond dealers. It will increase the effectiveness of your advertising, for instead of addressing an audience of perhaps ten per cent of the readers of

Digitized by Google

your advertisements, with a partial payment plan you widen your circle to perhaps 50 per cent, so too with circularizing. Again, suppose your salesmen average twenty calls a day, it is safe to suppose that they will find only four or five prospects with sufficient money on hand to buy outright; yet with the reasonable selection of his prospects, which you expect of your salesmen, it is safe to say that, with a partial payment plan, his chances of doing business with the same twenty men would be increased from perhaps 100 per cent to 200 per cent.

If you want to increase bond distribution and at the same time deal a body blow to the slick salesman of blue sky securities, put in a partial payment plan. Don't worry too much about the profits; consider rather the service which you are rendering and the good will you are establishing, and I venture the opinion that the balance sheet will be on the right side of the ledger at the year's end.

The Advertising Problem

I have saved advertising, the item which is undoubtedly of primary interest to all of you, for the last, and in many ways I regard it as the most important question in the problem of increasing bond distribution today.

The smaller unit of bond sales now prevailing provides the strongest argument for bond advertising that it has ever had. More sales must be made and every sale must be made more easily and more quickly than before if the efforts of our salesmen are to continue productive. More and better bond advertising can accomplish this. Our present advertising methods, while vastly superior to those of several years ago, are still in many respects the corollary of bond distribution methods of the day of the $20,000 unit sale. I need only cite the advertisement offering a new issue of bonds (which constitutes a considerable part of all bond advertising) to make this point clear. Such an advertisement is a cold statement of statistical facts, with absolutely no selling punch; it is addressed almost wholly to the larger and more experienced buyer, who today is not the most important factor in the market. One of the largest single opportunities for increasing the effectiveness of bond advertising lies in this one field of flotation advertisements, which with proper handling can be made to fulfil their present purpose, while at the same time reaching cost, interesting and selling a vast new market, which present methods entirely neglect.

This is equally true of bond circularizing, which ordinarily consists of a formal circular describing in analytical fashion the terms of the issue, and accompanied by an equally uninviting letter. Both are prepared for the large and experienced buyer and both fail miserably to produce under existing conditions. I cite these as two outstanding, vulnerable points in present day bond advertising.

I said what we need is more and better advertising. It is hard to separate two items, but let us consider the question of more advertising first. The amount of bond advertising, considering the volume of the bond business, still remains relatively small, due largely to the fact that we have not sold ourselves and our associates on its true value. Let's get away from the idea that we have to produce a tangible dollar of results for each dollar of advertising expended. With our salesmen confronted with the problem of increasing their production, isn't there more value to giving them proper backing than to attracting a few inquiries and making an occasional direct sale? Is the example of other merchandisers in their generous use of printer's ink of no value to us? Let's advertise more individually and let's bring pressure to bear to get such associations as the Investment Bankers Association of America and the American Bankers Association behind a broad-scale and broad-range advertising campaign.

(*Continued on Page 28*)

Speeding Delivery Of Small-Lot Freight

Container Cars and Motor Trucks Extend Rail Head Service to the Shipper's Door

The upper photograph shows a container car with two large and two small compartments ready for a trip from Chicago to Cleveland over the New York Central Railroad. Below, a motor truck is transferring a cargo of parts, hauled from the factory of the White Motor Company, Cleveland, to a New York Central container car. The shipment was consigned to the Chicago branch of the White Company.

THE LATEST in transportation equipment is the container car. It has been tried out by the New York Central between New York, Cleveland and Chicago and is certain to spread to other shipping centers between which there is a constant exchange of commodities.

The mission of the container car is to expedite delivery of less-than-carload volumes of freight from shipper to consignee. Its use calls for co-ordination of carriers—steam railroads, motor trucks and electric railways.

Vault-like compartments, built to occupy one-third or one-sixth the floor space of a 50-foot freight container car, or one-ninth the floor space of a 66-foot express car, are loaded at the warehouses of shippers, transported by motor trucks to the railroad yard, there lifted by crane to the freight or express car and secured by hooks and steel guides for the next stage of the journey.

Arrived at their destination, the compart-

40 Gears in One Operation

Stevenson Multiple Gear Shaper Said to Be Notable Industrial Advance; It Will Be Produced in Detroit

The Stevenson Multiple Gear Shaper as set up at the Indianapolis plant. The cutting operation is confined to the cylindrical casing, beside which George E. Stevenson and his son, George R. Stevenson, are standing. To the left is the power system and the water power equipment.

ONE of the new high production machines which, its believed, will reduce the cost of manufacture of circular saws, spline shafts and certain types of gears, is the Stevenson multiple gear shaper, an invention of George R. and George E. Stevenson, Indianapolis. The claim made for this machine is that it will cut from thirty and forty gears of eighty circular saws in one operation, and that gears now costing in the neighborhood of 66 2-3 cents each can be manufactured and sold for forty cents.

This machine is manufactured by the Stevenson Gear Company of Indiana, a concern capitalized at $10,000,000 and occupying a modern plant in Indianapolis. The Stevenson multiple gear shaper, the multiple grinder and multiple miller are not to be sold to industrial concerns, but the product of these machines will be when there is a market for them.

Set of eight gears cut with Stevenson Multiple Gear Shaper from the following materials: Tool steel, ordinary steel, molybdenum, aluminum, bronze, and fiber. All teeth cut in one operation.

The establishment of a subsidiary company in Detroit is contemplated, the local company to be known as the Stevenson Gear Company, of Detroit, capitalized at $3,600,000, and with the following officers and directors:

President, Richard T. Wingo, Detroit, president of the Superior Machine & Engine Company.

Vice-president, Charles E. Sweet, Detroit, treasurer of the Superior Machine & Engine Company.

Secretary, Simeon McQuiston, second vice-president of the Stevenson Gear Company of Indiana.

Treasurer, George W. J. Linton, Detroit, vice-president and cashier of the American State Bank.

Directors, George E. Stevenson, Indianapolis, inventor of the machine, and secretary of the Stevenson Gear Company of Indiana; Frank C. Sibley, Detroit, attorney and director in a number of industrial concerns; Elmer D. Johns, Indianapolis, treasurer of the Stevenson Gear Company of Indiana.

According to the public announcements from the Indiana plant, George E. Stevenson, who has been a gear manufacturer for several years, has been endeavoring to perfect a machine powerful enough to produce a large number of gears at a time, and cut them accurately enough to meet with the requirements of the automotive and other industries making use of gears of all kinds. It is claimed now that the machine has been perfected and the manufacture of gears will be conducted on a large scale.

The multiple gear shaper is said to be one of the largest industrial machines ever made. It represents a radical departure from any of the gear cutting or shaping methods now used in the automotive industry. The demand has been for gears accurate to one and one-half thousands of an inch. Because of the accuracy required it has been impossible to cut any number of gears at a time. At the plant of the Hudson Motor Car Company the production department has been able to rough out four gears at a time, but has not dared to attempt accurate cutting of more than two gears at a time. If the claims made for the Stevenson multiple gear shaper should survive the tests necessary to prove whether it can produce gears good enough for automotive work, the invention, it is asserted, will be one of the most remarkable and valuable ever conceived in automotive machine engineering.

The criticism made by automotive production men who have seen only the photographs is that, while the machine may turn out gears accurate enough for ordinary machine use, or circular saws, it could not be expected to cut or shape gears fine enough in measurement to satisfy the demands of the automotive industry.

At the Stevenson plant in Indiana, however, the claim is made that so far the machine has produced gears of various types out of materials of various kinds that have withstood every test as to cutting and accuracy. Gears have been cut from molybdenum, fiber, tool steel, ordinary steel, aluminum and bronze.

A detailed description of the machine and its operation is not available, but, roughly, it consists of an iron casing eight or ten feet high in which is set a heavy revolving steel table with a hole in the center as large as the gear blank to be cut. Above and concentric with this hole is a clamping device to which an

View of tool set on revolving table showing cutting tools clamped in place. Adjusting cams can be seen at the outer edge of the table. Depth of cut is regulated by double gears shown at the lower edge of the picture. The arbor holding the gear blanks is forced up and down through the center hole and the cutting tools broach out the gear teeth. A heavy steel cover is bolted over the table.

arbor is fitted. On this arbor the gear blanks are placed. By a reciprocating, vertical motion the arbor containing the blanks is carried up and down through the hole so that the cutting tools come in contact with the work. The clamp and arbor are hydraulically operated.

The cutting tools for gear work are set in channels on the steel table, which is a chuck of unusual proportions and odd design. At the outer edge of the table are cams which anto-

Digitized by Google

matically adjust the cutting tools, while the arbor automatically indexes the teeth by rotation. The whole process is more that of broaching than cutting. The claim has been made that certain types of steel gears used in almost every automobile can be made on this machine at the rate of 300 gears an hour. This particular gear, it is claimed, wholesales for 66 2 3 cents, but produced on this machine and from the same stock, it can be sold as low as forty cents.

The company organized in Detroit is seeking a plant with the intention of beginning production in the fall, but if a factory suitable for this work cannot be found, one will be constructed. The present plan is to put 800 men at work when the plant is ready.

Employment in Detroit Is Better Than Pictured

The report of the Employers' Association of Detroit for the week ended June 7 shows conclusively that recent rumors started and guesses made by uninformed persons, as well as by some who seem only too pleased to circulate unfavorable reports about Detroit, are quite unfounded. While the upward trend in employment has not been for three or four weeks as marked as might be desired, the situation is far from being as dark as some have pictured it.

On June 7 there were employed in the 79 plants, members of the Association, a total of 113,530 persons, as compared with 113,496 for the week of May 31. Thus there were 121 more men on the payrolls. Quite a bit different, this, from the rumored lay-off of several thousands. Even more satisfactory is the statement that of the above total there were only 23,512 men working part time, as compared with 23,135 the previous week. These men were distributed among 27 plants and their average working hours was 31, or one-half hour less than during the week of May 31. There were 93,218 full time workers, or 2,947 more than the previous week.

Considering that the birth mark thus far this year was the week of May 10, when 118,497 workers were on the payroll of the 79 concerns, the decrease since then has been only 4,967.

POSEN'S FIRST FAIR

Following the example of other important European cities, such as Leipzig, Lyons, Brussels and London, the city of Posen, in Poland, held its first exhibition of samples of Polish industry and wholsale trade, May 28 to June 6. According to press reports the event was a success and will become an annual affair. The exhibits were in three groups, as follows: First, machinery of all kinds; tools, nails, screws, mechanical requisites, etc; second textiles, leather goods, articles carved in wood and bone, wicker goods and furniture, glass and porcelain goods and earthenware, fancy goods and toys; articles made of rubber, celluloid and bark, fancy boxes, Christmas tree ornaments, stationary, printed pictures, books, musical instruments, watches and clocks, photography, jewelry, building line, ornamental line, and, third, metal goods, household and kitchen utensils, lighting appliances, cooking stoves, brushes, painters' tools, rope, twine, foodstuffs and drinks, chemical, pharmaceutical and technical goods, surgical and cosmetical instruments and perfumes and toilet goods.

COPPER SALES EXCEED OUTPUT

According to the American Metal Market, approximately 100,000,000 pounds of copper were delivered in May—60,000,000 for domestic use and 40,000,000 for export. Production during the month is reported as aggregating 50,000,000 pounds.

STRAIGHT LINE METHODS

Balanced Business

No sales department, however well organized, can operate successfully with indifferent buying and producing facilities. Production on the other hand, however efficient, becomes overproduction, if not balanced by capable selling. Balance between departments must back up co-operation if waste, unnecessary overhead, shut-downs, are to be avoided.

Balanced Business, which means Better Business, is almost wholly dependent on sound Accounting Methods. Timely and dependable Facts and Figures from every department are the balance wheels—the executive's surest guides. All intelligent progress, broader missions, co-ordinated strength, larger profits — depend upon them.

And that Facts and Figures may more quickly and clearly tell the executive their vital story—Graphic Charts, the moving pictures of your business.

Maintaining Our Merchant Marine

Bare Boat Charter Basis, With an Early Revision Of Our Navigation Laws, Are Two of the Essentials

By JAMES A. FARRELL
President, United States Steel Corporation

"POLICY" is perhaps a misleading word to use in connection with the development of American shipping; from first to last the impelling force of that process has been the dictates of necessity. The future of our merchant marine development is at stake and its present position is the outcome of haphazard efforts to deal with a problem the requirements of which necessitated from the beginning a settled policy and a well defined purpose. Having inherited a legacy which has brought about an almost complete cessation of governmental as well as individual effort to obtain for American ships a share of our sea-borne commerce, it is necessary to consider the underlying forces and premises which have caused this condition, one somewhat analogous to our government's identification with the operation of our railways. Although it is unlikely that anything effective can be accomplished for the time being, during the present world wide depression, for which there is no precedent in the history of shipping, for the months of the fleet, there remains about 4,000,000 dead weight tons of ocean-going tonnage owned and operated by private capital.

The signing of the Armistice, November 11, 1918, found us with a fleet of 16,000,000 dead weight tons built and under contract to be delivered, constructed largely on a cost plus basis, which encouraged inordinate costs and put a premium on high overhead expense. Aside from their cost, the steel ships were well constructed and with a few exceptions compare favorably with the work of the best builders in any country. While we may only surmise what will ultimately become of the wooden ships which were built in a period of the dictates of military necessity, and in response to the appeal from our associates for ships and more ships, the fact remains that our steel ships are fine examples of the skill of American mechanics, and with a broad and enlightened maritime policy should prove useful in shaping the future of American shipping.

Equal Competition Necessary

A plan which will enable American ships to compete on terms of equality with those of foreign flags. Efforts were made after the armistice to induce the Shipping Board to sell a large portion of the fleet to foreigners (Congress having enacted a law forbidding the alienation of American vessels without the consent of the Shipping Board). For a period extending into the year 1919 an opportunity existed to dispose of a large portion of the fleet at prices bearing a fair relation to a moderately depreciated cost. At that time our competitors abroad had no advantage in cost of building and only a slight advantage in cost of operation. Not having taken advantage of this opportunity, the Government "missed its market" and, it is estimated, lost a chance to realize at least $500,000,000, a sum representing the difference in the market value of the tonnage of steel ships which could have been sold at that time and the appraised value today. Meanwhile foreign governments were obtaining large loans in the United States a portion of which was expended in the acquisition of foreign tonnage and in the placing of orders for new tonnage in other countries. Materials entering into the construction of ships were, as always, considered a commodity of commerce and were exported, but not so the finished ship; otherwise shipbuilding would have been stimulated and employment given our labor. Later, when the embargo was lifted, conditions had changed and opportunity had vanished. While the valuation that must ultimately be placed on the ships will bear no relation to their original cost, it is questionable whether under present conditions any considerable tonnage could be sold except at a sacrifice which is not warranted, pending a revival of business in foreign markets, and considering the nominal cost of maintenance laid up, and further considering that the world is over-supplied with tonnage and that there will be no demand, except for certain special types, until the present supply is absorbed. Any revival in the world's trade should find us with the necessary mechanism to protect our exports and facilitate their expansion.

The Problem

We should have ready also as a national security an adequate navy auxiliary in case of need. The necessity of a merchant marine to supplement our navy was realized at the outbreak of the World War and the United States should never again be placed in the position it was at that time, when it found itself without sufficient ships to support its army and navy, not to mention the necessity from an economic standpoint of maintaining our trade with neutral markets.

Readjustment of values is obviously necessary due to the fact that the present involved status of shipping is the outcome of unrestricted development begun in the emergency of war and expanded by continued exigencies, regardless of price or deliberate thought of subsequent economic results. Approximately 2,300 ships were so provided, of which 800 were put in service immediately following the Armistice under a no-profit agency agreement whereby the Shipping Board acted as commission to the operator without risk or liability to the latter. As will be remembered, ocean freights were abnormally high and the extremely liberal terms induced many to enter the business whose inexperience brought about a riot of extravagance in all branches of the shipping industry, and for this we are paying the penalty in inflated charges for ship repairs, wharfage, stevedoring, fuel, supplies, crews' wages, etc.

With this background of the forces and factors involved in the situation, serious consideration must be given to the problem of maintaining our merchant marine. It hardly requires much reflection and calculation to figure that even with a temporary improvement in ocean freights the world's idle tonnage cannot be absorbed under three years. All maritime nations are affected; counting England, France, Italy, Belgium, Japan and the Scandinavian countries, approximately 7,000,000 tons of carrying capacity are laid up out of a total of 60,000,000 tons (of which 5,000,000 tons is still under construction). In normal times, had there been no interruption of the natural growth of trade this tonnage would be largely employed; but because an economic metamorphosis has taken place as the result of the war and the ordinary processes of trade have been unbalanced, it will require time to build up the economic structure.

It might serve a useful purpose to onselves and the world to bring about an international conference of the maritime nations to stabilize the shipping situation, on the theory that one part of the world cannot be crippled economically while the rest is prosperous. The finances of Europe and other countries are in a chaotic condition, while the United States is prosperous. An international laying-up program on the basis of relative percentages of tonnage owned, and conference rates on a parity from all countries, would largely solve the problem by limiting the total tonnage of ships in employment to the cargo available. While this plan would appeal to practical ship owners the world over, intervention on the part of a maritime balance of nations would probably surround this economic principle with a maze of entanglements which would destroy the main purpose to be achieved; although the accomplishment would make a practical contribution to the promotion of peace.

There are many importers and exporters in this country whose desire does not seem to be to support an American merchant marine on an equal basis. It would be no great hardship for the majority of the American importers to pay a fair rate on their imports, nor for some of the American exporters of bulk commodities to sell their goods on a C. I. F. basis, thereby controlling the ocean freight and allowing American ships a reasonable freight rate. The great mass of foreign tramp tonnage will regulate the ocean freight rates for American steamers as long as our producers sell their products F. O. B. American shipping ports. This is not an appeal to patriotism, but an appeal to reason, since our producers cannot know their markets nor the laid down parity of their competitors' prices unless they include in their sales price the cost of their goods, the insurance and ocean freight to ultimate destination. It is hardly enough to maintain our ships on the seas against propaganda and disparagement largely by our own people, without forcing rates to a ruinous level by unfair means. It is up to American producers to support our shipping in this crisis; our merchant marine is an all-American proposition; co-operation should take the place of merciless competition. Producers of all kinds of materials of industry and soil, as well as capital and labor, should not only realize the possibilities of our merchant marine but the necessity for its maintenance, and the fact that in supporting it they are adding to our commercial prestige and national welfare. The maintenance of regular sailings of combined passenger and freight steamers between the United States and foreign ports is necessary for prompt carriage of the mails, express matter and merchandise. American travelers should give the American passenger vessels the same consideration that shippers should extend to the cargo carriers.

Trade Route Policy Impracticable

It is time to recognize the fact that the policy of the Shipping Board since its inception, of endeavoring to build up trade routes from every Atlantic, Gulf and Pacific port to practically every port in the world, is expensive and impracticable despite the claims that the abandonment of this policy would bring forth in

Greater Production

Is the result of installing "Milwaukee" Milling Machines.

With the double overarms, constant speed drive, automatic lubrication, one piece box section column, box section solid top extended bearing knee, strong table and saddle, 18 speed changes, 12 feed changes in either direction, the great accuracy, small floor space required, and heavy cuts that can be taken, greater production naturally results.

Motor Price Cuts Continue; Business Reports

A FEW MORE passenger car makers and one of the largest producers of motor trucks have joined the ranks of the price-cutters during the last few days. The latest reductions range from a mere $15 or $20 to a trifle of $1,100 to $1,900.

Indications are that business is improving. In some sections of the country there is no marked betterment; general advices have it that in the East, especially, sales are better. Quite a number of the automobile manufacturers have received visits from many of their dealers or distributors and the latter have placed orders for a fair number of cars. It cannot be said, however, that because distributors order cars this means actual sales to the public. In some cases at least 50 per cent of these cars have been actually bought or ordered by prospects, while the other half has been taken by dealers in order to have a fair amount of stock on hand for immediate delivery.

Here are some of the facts gathered from the press or from other sources as affecting the automobile situation.

As soon as the Nebraska Buick Auto Company, Omaha, Neb., heard from the Buick Motor Company that prices would be cut, it called a special meeting of its dealers. It is announced that about 300 came to Lincoln to attend the meeting. The result was that after learning the new prices the dealers placed orders for 151 cars. On the following day three dealers ordered thirty-two additional cars and eighteen more machines were ordered by individual dealers, making a total of 201 cars ordered at the new prices, and all for immediate delivery. The Nebraska Buick company further advises that on the last day of May 75 carloads of

By MARC BRAUN

Buicks were shipped to it from the factory and that another trainload was to follow within a week.

In commenting upon the situation one of the officials said: "Nothing indicates more plainly that the merchant and public are only waiting reasonable reductions on all merchandise, and when these come they will buy as usual and the entire business world will move forward in the steady way it did before the riotous times during the war. 'Bring your price down and we'll buy,' seems to be the slogan of merchant and buyer alike."

Sales of Ford cars on the Pacific coast, not only are good but the future is looking very promising, according to Controller F. H. Merrill, of the William L. Hughson Company, San Francisco, Cal., Ford distributor. While in Portland, Ore., and after having visited Seattle, Wash., he said he had been favorably impressed with business conditions in the northern metropolis, at least insofar as the automobile trade was concerned. The Seattle branch of the Hughson company, which started to handle Ford cars only last December, is now near the lead in sales among the entire Ford sales organization on the Sound. This condition refers to the latter part of May—that is, before Ford prices were reduced.

Concerning the Ford business in Portland, Ore., the six Ford distributors in that city announced a few days ago that during the period from January 1 to May 20, nearly 50 per cent more Fords were sold and delivered than during the corresponding period in 1920. The totals were respectively 1,212 and 851. There were at that time, May 20, some 335 cars ordered and still to be delivered. As for the whole state of Oregon, Manager S. A. Stellwagen, of the Portland Ford branch, stated that each month since January had shown an increase over corresponding months in 1920 of from 40 to 62 per cent.

According to a report from the East, the business of the Ford Motor Company's New York branch during May was the biggest in the history of the company. From the assembling plant at Kearney, N. J., 500 cars a day are shipped out, while two months ago 300 cars were leaving the plant daily, says the Wall Street Journal.

Regarding the business of the Packard Motor Car Company of New York the same paper said a few days ago: "This company, which is a sales subsidiary of the parent organization at Detroit, reports continued improvement in business. Sales and deliveries in May were substantially better than the previous month and thus far in June shipments have been more than twice those of the corresponding period of May.

"Truck business, which with many companies is practically stagnant, is particularly good with Packard. In the first seven days of June the New York branch delivered 24 trucks, as compared with twelve in the first seven days of May. The situation in the New York district probably is somewhat better than in most other sections, although Packard business throughout the country as a whole is improving."

Announcement was made by the H. H. Franklin Manufacturing Company, Syracuse, N. Y., that since the price cut of June 1, deliveries to Franklin dealers have increased 100 per cent.

GENERAL MOTORS' SHOWING

Although production with the various subsidiaries of the General Motors Corporation averages only 45 to 50 per cent of capacity, sales show a constant growth, according to the Wall Street Journal, which says:

"Sales have shown a steady increase since the first of the year. Sales volume in dollars and cents for the first five months of 1921, as compared with the corresponding months in 1920, a banner year, were as follows: January, 24 per cent; February, 43 per cent; March, 54 per cent; April, 75 per cent; May, 72 per cent. Recent cuts in prices have greatly stimulated sales for the various units of the corporation. Even at the most drastically reduced prices these sales show a profit. Total sales for April and May amounted to about $35,000,000 for each month.

"Since the high peak which the General Motors Corporation inventory reached last fall, it has been reduced by about $85,000,000 from $217,000,000 to $159 000,000. The latter figure, according to operating executives, is but little above the amount of inventory which the Corporation should carry to transact a normal business.

"The Corporation's loans at present amount to about $70,000,000. Cash in banks amounts to about $44,000,000. The Corporation has accounts in 186 banks throughout the country.

"The net earnings, after all charges for both April and May, were more than $5,000,000 for each month, thus showing earnings for two months nearly in excess of the amount—about $6,250 000—required to pay the 7 per cent and preferred stock dividends for the entire year."

FRANKLIN PROFITS $775 000

The board of directors of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., last week declared a common stock dividend of 50 cents a share, payable July 11 to stockholders of record June 30, 1921.

Profits for the first five months of 1921 are estimated to be in excess of $775,000, after taxes. Over this same period, 4 317 Franklin cars were sold, the retail value of which aggregated $14,500,000. June business has started out favorably, with 100 per cent increase in deliveries reported by Franklin dealers throughout the country for the first six days of the month (as compared with the corresponding period in May), this impetus following closely the drop in prices June 1. The Franklin factory continues to operate at 100 per cent capacity, or at the rate of 40 cars a day—a schedule which has been maintained steadily since February 10

NORDYKE & MARMON CHANGES

The Nordyke & Marmon Company, Indianapolis, Ind., announces the following changes in its personnel: A. R. Heinkel and H. G. Shafer, who were respectively treasurer and secretary of the company, have been promoted to be vice-presidents; former Assistant Treasurer H. L. Purdy is made treasurer, and Sales Manager H. H. Rice becomes secretary. The new sales manager is H. H. Brooks, while A. J. Rogers, advertising manager, becomes assistant sales manager.

A NEW PACKARD CARBURETOR

An invention which, combined with the "twelve" is said greatly to increase gasoline mileage, is announced by the Packard Motor Car Company in connection with its Single Six cars. It is a new style carburetor designed to give automatically a mixture which meets the needs of either heavy or light pulling. It is known as the "two stage fuel" carburetor.

"This new carburetor meets one of the most serious difficulties which has stood in the way of high gasoline mileage," says H. W. Peters, general manager of the Packard-Detroit Branch. "The ordinary carburetor gives entirely satisfactory service either when a car is idling or when it is pulling wide open, as on a heavy grade. But to do this it must provide a mixture which cannot be made materially leaner without loss of power on heavy pulls, or stalling when idling. Unfortunately for economy, about 90 per cent of all driving is neither idling nor heavy pulling. So for this 90 per cent the carburetor must give too rich a mixture.

"The two-stage jet carburetor takes care of this situation automatically. It gives the rich mixture when it is needed fully as well as the old style did. But in ordinary driving a leaner mixture is given without any attention from the driver. This is accomplished by having two jets, and the one for the richer mixture is placed so far above the medium speed jet that it will not work during ordinary running, but responds perfectly to the high suction from the engine which is created by a heavy pull.

DURANT CARS BEING ASSEMBLED

With about 200 men employed, rapid progress is being made by the Christman Construction Company on the Ver Linden assembly plant for Durant Motors, in Lansing. The force is steadily being increased and it is expected that between 700 and 800 men will eventually be engaged. Some Durant cars are now being assembled at the Long Island City plant and it is expected that they will be on the market by August 1. The machine is to cost less than $1,000. Local dealers are to be appointed soon. Of the 6,000 Durant stockholders in the United States, 300, or about 5 per cent, live in Lansing, according to G. N. Murchey & Company.

SHIPPING 125 OLDSMOBILES DAILY

Charles H. Tucker, Omaha, Neb., former sales manager for the Olds Motor Works; C. F. Batcheider, Macon, Ga.; R. V. Ramsey, Kansas City, and H. C. Dunn, Boston, distributors of Oldsmobiles, have returned to their respective territories after spending a few days in Lansing with Guy Pessley, sales manager. Business was reported to be good, especially for Oldsmobile Fours. The stock in the local plant is cleared out daily by shipments, which average 125 a day.

PINTLE HOOKS MADE STANDARD

Motor Truck members of the National Automobile Chamber of Commerce at their annual meeting adopted pintle hooks as standard equipment. Where such hooks are attached to motor truck or tractor frames they should be of the United States government type, according to the recommendations. The hooks should be so mounted that the axis of the drawbar head is located both vertically and horizontally approximately in the center of the frame of the chassis. It is necessary therefore that means be provided for fastening one end of the safety chain to the rear end of the motor truck chassis frame; the clevis is to be located directly under the axis of the drawbar head, or as near to this position as possible.

The position taken by the Trailer Manufacturers' Association of America was that it was not necessary for the truck manufacturer to place a spring behind the drawbar head or pintle hook on the motor truck. In substantiation of this the Association stated that trailers

Digitized by Google

made by reputable manufacturers have a starting and stopping spring in the drawbar or trailer head, which is of proper length and strength; any additional springs furnished by the truck manufacturers would therefore give too much spring action and cause the trailers to bump the truck. In the interests of better protection of the truck frame and driving mechanism, truck manufacturers, however, are urged to equip their drawbar heads with springs according to the recommendation adopted by the national chamber.

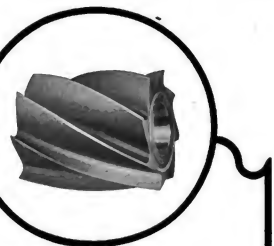
ANIBAL JOINS COLLINS

B. H. Anibal has resigned as chief engineer of the Cadillac Motor Car Company, Detroit, to become associated with R. H. Collins, former president of the Cadillac, in the new corporation Mr. Collins will head. Mr. Anibal is among the best known automotive engineers in the country and a number of the new engineering features found in the various Cadillac designs since 1911 were the result of his work. Previous to joining Cadillac, Mr. Anibal was with the engineering department of the Olds Motor Works, Lansing.

FIRESTONE PROMOTES HESS

Appointment of John D. Hess, Jr., as manager of pneumatic tire sales, with headquarters at Akron, is announced by the Firestone Tire & Rubber Company. Mr. Hess' advancement with the Firestone company is characteristic. Starting nine years ago as salesman at Detroit, he has successfully filled the position of branch manager at Cleveland, special representative to truck manufacturers, district manager on the Pacific coast and assistant to the western sales manager.

MEXICO CITY'S FIRST SHOW



An automobile show, the first ever held in Mexico City, is reported to have been very successful. It was practically an American show, for very few European machines were on display. Among the cars shown were the Auburn, Cadillac, Cleveland, Chandler, Apperson, Chalmers, Bonr-Davis, Dort, Franklin, Essex, Overland, Moon, Haynes, Studebaker, Ranger, Franklin, Mercer, Lexington, Kissel, Lonestar, Premier, Willys-Knight, McFarlan, Gardner, National, Maxwell, Hudson and Mercedes. In addition to these passenger cars models there were shown Service, GMC, United States, Wichita, Ranger, Federal and L. M. C. trucks. In the tractor section there were the Titan, Hart-Parr, Ranger, LaCrosse, Case and Oilpull. On the first day, it is said, thirty-two passenger cars and six trucks were sold.

AGENCY ADDS THREE NEW MEN

In order to give direct personal service to a growing number of clients, Campbell, Blood & Trump, Detroit advertising agency, has added Gage Tremaine to its staff.

Mr. Tremaine has long been an outstanding figure among his profession in Detroit. He enjoys the advantage of several years experience as a salesman, which, coupled with his extensive study of merchandising practices and investigations of marketing conditions, gives him comprehensive grasp of the problems of distribution. He was a member of the McJunkin Agency, Chicago, and of the advertising department of the Postum Cereal Company before coming to Detroit. Here he conducted a business paper advertising agency in the Free Press building for four years, after which he became secretary of the Brotherton-Knobie Company. This position he resigns to take up his new duties.

The steady growth of the business of this agency has also led to the addition to its copy department of A. A. Levenseller and George E. Post. Mr. Levenseller has had broad experience in selling and in handling advertising detail. He joins the agency from Frederick Stearns & Company. Mr. Post, a former newspaper man, comes from the Lincoln Motor Company, where he has been editing the company house organ, the Lincolnian.

Why Speculate on Cutters?

Cutter speculation should have no place in the shop that requires accurate uninterrupted production.

The real money-saving method is to buy recognized cutters that have made good both in service rendered and quality maintained.

Fifty years as manufacturers of cutters is a sound foundation that makes you realize that

Brown & Sharpe Cutters

are not a speculation but a paying investment. Paying in dividends that your shop requires—higher quality and greater production.

Our catalog should be in your file.

May we send it?

National Cartage Assn. Cruises Aboard Noronic

[*By Staff Correspondent*]

ON BOARD THE STEAMER NORONIC, June 15.—Two hundred delegates representing 3,000 motor truck and team operators opened the nineteenth annual convention of the National Team & Motor Truck Owners' Association on board the Steamship Noronic, with addresses of welcome from Michigan and Detroit representatives, Monday evening. A four day series of business sessions, interspersed with a generous program of entertainment, featured the cruise.

For two years the Association has been going through a process of reorganization, which will be completed when the 1921 convention adjourns by giving its officers tasks to do that will make for radical expansion and development.

E. Foster Moreton, president of the Detroit Transportation Association, hosts of the convention, opened the first session with an address of welcome on behalf of the D. T. A. Maj. Ralph Duff, secretary to Governor Groesbeck, greeted the delegates on behalf of the State of Michigan, and John Atkinson spoke for Mayor James Couzens, of Detroit. F. J. Abel, of Buffalo, president of the national association, responded for the visitors.

Following the reports of officers, as the first business of the convention proper, Wayne Dinsmore, Chicago, secretary of the Horse Association of America, delivered an address on "The Horse as a Short Haul Moneymaker," which led to a storm of discussion.

Mr. Dinsmore prefaced his remarks by declaring they were the result of a survey made in more than 50 American cities.

"The horse and the motor truck each have their place," he said, "and the man who makes money from their use knows when the field of each leaves off and the other starts.

"I maintain that the horse is far more economical as a transportation unit than a truck for short hauls or for extended city hauls where stops are frequent.

"A horse can be put into haulage work when he is upwards of three years old. After he is five or six he is at his best, for a continuous period of time, with proper care, until he has been in service for twelve years in all. Before the time he is put at work on trucking he has done light duty on a farm. After he has served about six years on heavy duty he is still good for several more on lighter work. No motor truck can show such a low ratio of depreciation or can compare in maintenance."

Secretary F. L. Henk reviewed the work of the Association for the last year and outlined the plan along which the Association could make the best progress. He recommended the development of long distance hauling business as a standard unit of the business, urging the members to study their field and make the most of this element of their work. He opposed store door delivery as putting the rail roads into the cartage business and said that it was being fostered as a scheme to sell equipment in a field already overcrowded. More education along cost lines was urged.

President Abel reviewed the nineteen years of the Association and predicted a happy future for it.

Cargo insurance was the principal subject for discussion at the evening business session on Tuesday. C. M. Carter, of the Detroit Insurance Agency, outlined some new varieties of coverage created by the development of motor hauling.

According to all signs, Joseph X. Galvin, Chicago, now first vice-president, will be elected national president. There is also every indication that F. L. Henk, Detroit, will be retained as national secretary.

Wednesday the cruisers were taken through Georgian bay, with a stop-in in the afternoon at Owen Sound. They were welcomed by the Board of Trade of that city. In the evening there was a masquerade party.

The business men of Owen Sound turned out to welcome the convention and drove the delegates over the city's beautiful parks and hills. There was golf and special entertainment for the ladies.—FISCHER.

MEMBERSHIP DRIVE PROGRESSES

[*By Staff Correspondent*]

LANSING, June 13.—Good progress is being made in the campaign for membership by the Michigan Highway Transportation Association, which recently was organized and has established headquarters in Lansing.

Captains have been appointed to direct the work in different counties, and these will select committees of assistants. These captains and their territories are as follows: F. H Stevens, Jr. (Saginaw), Gratiot, Midland and Bay counties; F. H. Henk, managing secretary (Detroit), Wayne, Oakland and Macomb; E. H. Hopperstead (Muskegon), Ottawa, Muskegon and Newaygo; H. G. Beach (Jackson), Jackson and Washtenaw; W. G. LeStrange (Mount Pleasant), Isabel, Montcalm, Mecosta and Clare; W. G. Stones (Hillsdale), Hillsdale and Branch; Henry Wellman (Hastings), Barry and Allegan; O. L. Aiden (Benton Harbor), Berrien and Cass; E. F. Raseman (Kalamazoo), Kalamazoo, Van Buren, Calhoun and St. Joseph; E. O. Pickens (Adrian), Monroe and Lenawee; L. J. Flannagan (Marquette), Upper Peninsula; E. M. Radcliffe (Grand Rapids), Kent and Ionia; Charles Foster (Cadillac), Wexford, Lake, Missaukee and Oscoda; Henry H. Stevens (Flint), Genesee, Shiawassee, Lapeer, Tuscola and the Thumb district, and H. H. Hardy (Lansing), Ingham, Eaton and Clinton counties.

H. H. Stevens, chairman at Flint, has offered to give a box of high grade cigars to the captain turning in the most members by July 1. Each captain is to send in the application blanks together with the $10 fee direct to the office of the secretary, H. H. Hardy, in Lansing. A record will be kept and a daily report made to the chairman at Flint.

CROSS-STATE HIGHWAY PROPOSED

Willard M. Bryant, Kalamazoo, was in Lansing last week to promote his fourth and latest good roads plan. This is a state highway from lake to lake, which he wishes to see authorized by 1923, and named the Rogers highway in compliment to Frank E. Rogers, state highway commissioner. Mr. Bryant proposes that this road start at Port Huron, where Mr. Rogers began his career as a road builder while city engineer there, and proceed to Mount Clemens, Pontiac, Howell, Mason, Charlotte, Hastings, Allegan and on to the Lake Michigan shore. Eight counties would be served, the road would pass through an important agricultural section, and would be a direct east-and-west route only a trifle less important than the Detroit-Chicago highway. Mr. Bryant's first big vision. His second was the Victory highway and third, the Colgrove highway. All these three are in a fair way of being realized, Mr. Bryant said.

NEW VAN AT LANSING

The Fireproof Storage & Transfer Co., Lansing, is boasting an unusually large and striking truck van for both local and long distance moving. The body was built on a 2½-ton Packard chassis by the Hulet Top & Body Company, Detroit. It is painted yellow with a display of the firm's name.

BRYANT BILL DEAD

Among the bills which died with the extra session of the legislature last week was the Bryant measure for the licensing, taxation and regulation of persons, firms and corporations engaged in the transportation of persons or property by motor vehicles as common carriers on the public highways. This bill was reported out favorably by the committee on highways and was debated in the Senate. However, no action was taken, so the measure passes out.

As a result, the bus and truck men of the state are breathing easier. In case the bill had progressed very far they were prepared to fight it. H. H. Hardy, secretary of the new Michigan Highway Transportation Association, declares that the Government now taxes the trucking companies 3 per cent, and with the additional 5 per cent suggested in the Bryant bill, it would have made an 8 per cent tax on the business. In addition, there would have been a heavy bond to pay for. In many cases such legislation, he said, would drive firms out of business.

IRON MOUNTAIN TO ESCANABA

The Iron Mountain-Escanaba bus line, Quinnesec, Mich., is now in operation, the two vehicles ordered for the purpose having been received. The route is from Escanaba to Iron Mountain and return over the following route: Escanaba, Ford River, Bark River, Harris, Wilson, Spaulding, Hermansville, Loretto, Norway Qainnesec and Iron Mountain. The trip is scheduled to take three hours one way.

ITALY WELL "BUSSED"

Italy is said to be one of the most completely "bussed" countries in the world. A recent map brought out by the Fiat Automobile Company, Turin, the largest automobile manufacturing concern in the country, shows that at the beginning of 1921 there were 452 bus lines using the Fiat buses alone, these routes covering a total of 9,965 miles. It is not stated how many other bus lines there are, but it is estimated that fully another 100 may be added to the above total.

REGULATIONS IN FLINT

The city council of Flint has decided that jitney buses cannot be operated on streets having street car lines, the object being principally to relieve traffic conditions on these thoroughfares.

The jitney men vigorously protested the action of the council. The ordinance, which went into effect June 16, provides that to operate a jitney bus in the city a person will have to file with the city clerk the route over which he proposes to run, specifying terminals and hours of operation, and not until it has been approved by the council will he be allowed to operate. Violations are punishable by a $100 fine or imprisonment in jail for 90 days.

A great motor

THE truth gains ground in these days of sane thinking, that the six-cylinder motor has, after all, no real equal in power, flexibility, balance, accessibility, endurance, low repair expense—that is, in all-around merit.

WINTON SIX

Especially is this proved in the Winton Six. Fourteen consecutive years devoted by the Winton Company to the manufacture of sixes exclusively have brought exceptional results. There is one of the world's greatest motors in every Winton Six car. Shown anywhere at your convenience. Call or telephone for demonstration.

TRANSPORTATION NEWS

Rail :: :: *Water*

Lansing—At a meeting of the directors and stockholders of the Michigan Northern Railroad Company, in Lansing, last week, it was decided to reorganize the movement for a rail line from Lansing to Midland and Bay City and again present the matter to the Interstate Commerce Commission. New financial and moral backing was offered the company by H. G. Bacon, Sterling. Representing the towns of Sterling, Malperidge, Secor, Prescott and other northern sections, Mr. Bacon tendered rights-of-way and stock subscriptions if the company would project the line north from Midland to the Sterling district. This would touch a rapidly growing agricultural section and get in touch with the Detroit & Mackinac and Michigan Central above Bay City. The engineers reported that the road could be built now for from 45 to 60 per cent less than a year ago.

Another meeting will be held soon.

Washington—The Wyandotte Southern Railroad is a common carrier and as such is entitled to participate in joint rates with other common carriers or have its rates absorbed on interstate shipments, according to a decision published late last week by the Interstate Commerce Commission. The Wyandotte Terminal Railroad is held not to be a common carrier.

Detroit—R. J. Maclean, chairman of the inland waterways committee of the Detroit Board of Commerce, says that the Scott bill amending the LaFollette Seamen's Act probably will be reported favorably soon in Congress, and that it will be so worded as to be satisfactory to all interests concerned in Great Lakes transportation. Mr. Maclean believes the amendment will make possible the reestablishment of routes recently discontinued.

Grand Rapids—Announcement is made by A. K. Zwald, general agent for the Crosby steamship line, that daily service has been started between Muskegon and Milwaukee, and that connections will be made with the Grand Rapids, Grand Haven & Muskegon interurban trains.

Sault Ste. Marie—According to the report of General Superintendent L. C. Sabin, of the Soo canals, freight carried through the locks totaled 6,155,063 tons in May, as compared with 8,421,210 tons in May, 1920, and 10,566,326 in May, 1919. The number of vessel passages was 1,515, of which 1,127 passed through the American canals. Two million three hundred and three thousand three hundred and sixty-nine tons of soft coal were carried up the lakes and 214,776 tons of hard coal were brought north. Only 3,215 tons of copper and 18,562 thousand feet of lumber were carried through. Oil, upbound, figures in the total with 63,261 short tons; stone, 74,660 tons. Twelve million six hundred and nine thousand four hundred and sixty-nine bushels of wheat passed east bound, and grain other than wheat, 12,431,593 bushels.

Lansing—The Michigan Aero Service, Lansing, opened its business here Saturday, June 11, by giving eight-seeing tours, inaugurating passenger carrying. H. P. Ayres and Jack Burns piloted the two machines in use. The company will have ten flying machines in service by June 25, motors and frames being in transit for eight additional planes.

Two New Michigan Cars; One of Them a Steamer

Maurice Bollstrom, St. Louis, Mich., has been demonstrating in Lansing his new front-drive automobile, the power being applied to the front rather than the rear wheels. The machine was built largely from standard units but it incorporates a number of new features, the chief of which are the MB Puildrive axle, the MB Staffeldt universal and the MB Nohle trail axle.

These three power transmissions will be manufactured in quantity, according to the plans of Bollstrom and the company he is organizing, for sale to automobile manufacturers who want to use them in their models. The company also plans to build complete cars in all models incorporating the new features.

Among the advantages claimed for the inventions are roadability, passenger comfort, lack of body sideway when rounding curves, maximum amount of pulling power, less skidding liability, absence of mechanism back of the power plant, floor level with running board, any length of wheel base, lower slung body with same road clearance, and effective brake control of the front wheels.

The test car looks much like an ordinary automobile except that the motor sits somewhat higher atop the front axle, and tonneau is slung lower and the rear wheels extend somewhat farther back behind the body.

When sufficient progress has been made, the question of a site will be taken up. It is possible that Lansing will be selected. Mr. Bollstrom twelve years ago, following his perfection of the four-wheel drive principle, helped organize the Duplex company, then located at Charlotte.

The experimental steam automobile being manufactured by the Kirchen Machine Company, Lansing, was completed this week. The car is backed by Lansing financial interests and it will probably be made in Lansing. If approved by the capitalists back of the project, the Kirchen company will be authorised to proceed with manufacture, and this will mean expansions in the factory.

According to Otto J. Kirchen, president of the company, the car will weigh less than 2,000 pounds. It will be somewhat similar to the Stanley. The cost of the machine has not yet been determined. However, it is said the cost of operating the car by steam will be about one-fourth that of a gasoline automobile, while a speed of 150 miles an hour can be obtained.

The Kirchen Machine Company has just turned out 50,000 new Reo pistons, which will be sold on the open market. This piston is 22 ounces lighter than those now used in Reo cars. Besides doing a large local business, the company has received many orders from Howell, Jackson, Grand Rapids and other Michigan communities.

PROMOTIONS IN WILLS PLANT

C. H. Wills & Company, Marysville, manufacturers of the Wills-Sainte Claire car, have placed Richard L. Frost, formerly superintendent of the final assembly department, in charge of all factory departments, and Charles F. Morgana in charge of engineering and designing.

ZIMMERSCHIED'S NEW DUTIES

K. W. Zimmerschied, General Motors Corporation official, has been appointed president of the Toledo Chevrolet plant, to succeed Thomas W. Warner, resigned. Mr. Zimmerschied retains his other General Motors connections.

Progress, Projects and Contracts of the Week

Mount Clemens—The city of Mount Clemens has declared its intention to pave Crocker boulevard during the present season and Harrison township will extend the pavement on the same thoroughfare a distance of two miles to Lake St. Clair. This pavement forms the connecting link of paved highway between Detroit and Mount Clemens via Jefferson avenue and Lakeshore drive.

Mount Clemens—The contracts for paving Grand avenue and Leander and Clinton streets were awarded Thursday to Will C. Hartway, representing the Willite Company. Grand Avenue and Leander street, treated as one job, was let for $45,206.35, and Clinton street for $25,661.15. The construction will be of two-inch Willite surface, with six-inch concrete base. The city commission favored brick or asphalt block but all bids on this type of construction were above the estimates.

New York—The George A. Fuller Company announces that its unfinished work, April 30, 1920, amounted to $32,602,898.06; that work taken in during the year ended April 30, 1921, totaled $33,711,801.58 and that work completed during the year amounted to $47,129,475.85. This left unfinished work April 30, 1921, of $19,185,213.79.

Detroit—According to John J. Comerford, president of the Detroit Lumber Company and chairman of the Board of Commerce housing committee, which is conducting an investigation of building conditions in Detroit, has issued a statement in which he says that at a closed conference between members of the committee and representatives of the state banks of the city, late last week, the bankers said they were anxious to lend money to persons desiring to build their own homes but that they desired to eliminate speculation in such building. Mr. Comerford's statement reads:

"Figures were quoted showing that the financial situation in Detroit is not so bad as many have thought. The banks have been lending and will continue to lend money to build homes which they think are not likely to fall into the hands of fly-by-night speculators. In making such mortgages, however, the banks use their own valuations of the property involved. We did not learn the average difference between the prevailing market value of property and the bank valuation."

Another meeting of the committee was to be held Wednesday of this week.

Pontiac—Eight firms have submitted bids on the construction of 1,050 feet of 33-inch sewer, 2,514 feet of 30-inch sewer and ten manholes. The bids were as follows: Halpin & Watts, Toledo, $96,846; Foley & Riley, Chicago, $102,613; Liberty Construction Company, Detroit, $100,308; George Pontarelli, Chicago, $100,425; R. L. Oakley, Detroit, $126,494; Pitt Construction Company, Pittsburgh, $100,235; Manson Company, Cleveland, $121,282, and Moreno Burkham Construction Company, St. Louis, Mo., $128,717. The award will be made shortly.

Flint—During the week ended June 4 there were 82 applications for building permits, entailing an expenditure of $344,554. Of the total, 35 permits were for new buildings.

Detroit—The list of general contracts and sub-contracts let during the week of June 9 by contractors and architects includes two schools, a number of residences and stores, alterations to the basement of the Central Savings Bank and some minor jobs. The list of projects in the hands of architects as furnished to the Detroit Builders and Trader's Exchange includes a four-story 29-apartment building; a brick and stone 53-apartment building; a brick, steel and stone 12-apartment building; a brick and steel storage house; a reinforced concrete market building; an eight-story and basement club house and some smaller jobs.

Lansing—The city fire department has been granted $27,239.97 by the council ways and means committee for the erection of a building on the lot owned by the city, the structure to contain the new fire alarm system that the board of fire underwriters declared necessary.

Detroit—The total number of permits issued during the week ended June 11 was 331, involving an expenditure of $1,531,240, as compared with 307 permits involving $3,417,973 for the previous week and 626 permits and cost of $1,664,140 for the corresponding week in 1920. Of the 331 permits issued last week, 241 were for new buildings and the cost of these structures is estimated at $1,256,300.

Lansing—The Lansing branch of the Worden Grocer Company, which was destroyed by fire, last week, with a loss of nearly $300,000, will be replaced by a modern plant on an even larger scale. The site for the structure has not yet been selected, according to President Guy W. Rouse and Vice-President R. J. Prendergast, Grand Rapids, where headquarters of the company is located.

BLACK & DECKER PRICE GUARANTEE

The Black & Decker Manufacturing Company, Baltimore, Md., manufacturer of portable electric drills, electric valve grinders and electric air compressors, has sent to its jobbers notice that present prices are guaranteed for the remainder of the year. In the course of the announcement the company says:

"In the last seven years the total increase in the prices of Black & Decker products has only been 38 per cent.

"In the same time the average advance in machine tool prices generally, including portable electric tools, has been about 150 per cent.

"A reduction of 45 per cent would be necessary to bring machine tool prices generally down to the same basis as the present Black & Decker prices.

"It is doubtful that machine tool prices generally can ever get as low as within 38 per cent of the 1914 prices. Even the most optimistic economists predict that when all commodity prices are finally stabilized the new level will be at least 25 per cent higher than 1914."

HASKINS JOINS SEELYE-BROWN

The Seelye & Brown Advertising Agency, Detroit, announces that L. O. Haskins, vice-president and general manager of the Powrlok Company, Cleveland, manufacturer of the Powrlok differential, has become associated with the agency.

Mr. Haskins is well known throughout the automotive business. For a number of years he was located in Detroit as assistant general manager of the O. & S. Bearing Company. He left this company to go into service, during the war, and rose to the rank of major in charge of production and inspection of motor vehicles in the Chicago district, and was stationed in Detroit. Since the war, Mr. Haskins has been associated with the Willys group of interests. He is a member of the Society of Automotive Engineers.

MICHIGAN SCREW CO. PICKS UP

Business of the Michigan Screw Company, Lansing, has taken a spurt and the company is now on about a one-third basis. The increase in the Chevrolet schedule has helped.

1922 New York Motor Show In Madison Square Garden

The twenty-second annual New York automobile show of the National Automobile Chamber of Commerce will be held in Madison Square Garden, the location of the first exhibit, in 1900, according to an announcement made a few days ago following a meeting of the directors and officers of the N. A. C. C. The Chicago show will be held in the Coliseum.

Decision to hold the next New York show in the Garden was due principally to the fact that the Grand Central Palace, the scene of recent shows, is to be remodeled into an office building. It is probable that an overflow exhibit will be staged in the Sixty ninth Regiment Armory, which is within a block of the rear entrance of the Garden.

The National Chamber elected five directors, as follows: A. J. Brosseau, New York, International Motor Company; A. R. Erskine, South Bend, Ind., Studebaker Corporation; Alvan Macauley, Detroit, Packard Motor Car Company; Wm. E. Metzger, Detroit, Columbia Motors Company; R. E. Olds, Lansing, Mich, Reo Motor Car Company.

Officers elected include: Charles Clifton, Buffalo (Pierce-Arrow Motor Car Company), president; Roy D. Chapin, Detroit (Hudson Motor Car Company), vice-president; C. C. Hanch, Indianapolis (H. C. S. Motor Car Company), second vice-president (Passenger Car Division); Windsor T. White (White Motor Company), second vice-president (Motor Truck Division); A. J. Brosseau, New York (International Motor Company), secretary; H. H. Rice, Detroit (Cadillac Motor Car Company), treasurer; Alfred Reeves, New York, general manager.

President Clifton and Director William E. Metzger are the veterans of the board. Col. Clifton and Mr. Metzger have been serving the manufacturers from the start, Mr. Metzger going on the board eighteen years ago.

LANSING FOUNDRY IMPROVEMENT

Following a period of inactivity, production at the Lansing Foundry Company plant is improving rapidly, according to Lyman Covell. The plant is running five full days a week, with forty per cent capacity basis. Good sized orders are being received and employes are being added.

HUPP'S POSITION

The Hupp Motor Car Corporation, Detroit, has cleaned up the last of its bank loans and now has no debts except current bills, says the Wall Street Journal. The company has also carried through a plant expansion program through expenditure of around $2,000,000. Though Hupp had its share of high priced materials at the close of 1920, these have been worked off and the corporation is now purchasing for present consumption. The recent price reduction stimulated dealers' sales throughout the country. Operations now are not far from normal, being at the rate of 2,000 cars monthly. The plants were recently shut down for several days to permit sales to catch up with the output. When need arises, this policy will again be adopted.

UNITED ENGINE CO. BUSY

President Charles L. Sprinkle, of the United Engine Company, Lansing, reports that business is good and on a 100 per cent basis, with the export trade very satisfactory and prospects bright for continued prosperity.

VIM ON 20 PER CENT BASIS

The Vim Motor Truck Company, Philadelphia, which has been taken over by the Standard Steel Car Company, Pittsburgh, is operating at about 20 per cent of capacity, turning out fourteen trucks a day. Harold B. Larzelere, vice-president and general manager, will continue in that capacity.

A Machine Tool Service Station

In Detroit
where so many Warner & Swasey turret lathes are operating
a Service Staton is imperative,
so we put on at 5928 Second Boulevard.

Two practical men are there to serve you—
Men who know Detroit and its vicinty
and who know Warner & Swasey Turret Lathes,
C. S. Stilwell, Manager, and Wm. B. Pope.

Turret lathes of each size are on exhibit there.
You can buy one right off the floor if you like,
and equip it with tools from the stock we keep there,
or you can buy tools for the machines you have.
Our tools are adaptable to any make turret lathe.

Come and look us over—or telephone us.

DETROIT, SATURDAY, JUNE 18, 1921

Let the Utilities Alone

AS THE DATE of primaries for election to public office become proximate the candidates are getting ready to bait the corporations so that they may excite the interest of the populace and give them to understand that they are working for the best results. It is only a few months since the telephone industry in Michigan was saved from what seemed imminent disaster by the action of the Public Utilities Commission in making an advanced and profitable set of rates throughout the state. It is not very long since the Detroit City Gas Company was given an advance. About a year ago the street railway company in Detroit was allowed an extra cent as a result of a court agreement upon a showing that it was losing money. Saginaw had riots over its street car affairs; Grand Rapids gave its electric supply company some concessions; but now some politicians are seeking to cut them off, and so on and so forth down through the entire line of Michigan cities.

The success of industry and a program of good living in this state depends more today than at any other time upon proper service from the public utilities companies. That proper service cannot be rendered unless utilities companies are themselves permitted to make a profit. They cannot do it upon a loss because their surpluses have been exhausted and losses can no longer be sustained. Moreover, they are yearly asked for a higher quality of service and for a more thorough extension of their services into the communities in which they are located. Time was when the service of gas companies and electric railways did not extend through more than the business district and on long routes to the edges of the city. Today there is a demand for a general diffusion of the service of gas and electric companies and of closer contact between the railway lines and the homes of the people. All of this calls for a greater overhead, and generally a growing disproportion between gross income and gross investment.

We observe that the mayor of Detroit, who has several utility problems on his hands, has undertaken a new one; that he is endeavoring to procure a cut in the telephone rate, the result of which, if it be accomplished, can only be to reduce the quality of service and reduce the pay of thousands of employes of that corporation. Most of these utilities companies are natural converters. They do not create a service out of nothing and peddle it broadcast without very great help. They are among the largest employers of labor in this state. Telephone companies combine plant with the energies of operatives to produce service. Railway companies combine plant with the turning of coal into power and with the services of operatives to produce service. Electric light and power companies turn coal into energy which may be transmitted by wire, using the minimum of employes, while the aggregate of their employes is very many. Gas companies simply distil coal as raw material and distribute the gaseous product of the operation to users of gas service, selling their by-products in the public market. They are distinctly manufacturing concerns turning over raw material and the use of plants and the services of men and women to the public for a return upon the capital invested.

They have been permitted to go through very hard times since 1917; indeed earlier than that those of them that used the services of men and women and consumed coal were the victims of the high prices incident to that period of the war which preceded our own entrance into it. Practically since 1914 and until 1919 their complaints for additional revenue were not entertained. Their income was fixed by law or by regulation, and law had to be changed or public regulation applied before they could get what other manufacturers were getting in the way of increased prices for their services and their product.

In the case of the telephone industry we have lately been experiencing a betterment of conditions in Michigan as a result of the availability of larger income. That income has not been enjoyed so long that more than one-half year of its results have been noticeable in the earnings of the company. Yet with this encouragement the operators of these concerns in Michigan have discounted the future, have coaxed capital into their service at high interest rates and have been endeavoring to give the public a better and more uniform service for its money.

When general business is dull all the instruments which are available for the doing of business should be in the best condition. It doesn't make much difference when business is very good whether the long distance telephone service is efficient or not, because one is not so competitive for new business then as he is in the kind of times we are going through now; but in this kind of times it is absolutely essential that every method of transportation and communication and every domestic service which is handled in the gross by the public utilities companies should be at its best and that its operators should not be distracted between the question of giving good service and the other question of getting the money to pay for it.

Never before were the public utilities companies of Michigan deserving of such generous treatment as they are at the present time. They have no printing presses in the back room to turn out new $2 bills with which to pay their shortages. They must earn it from the public, and the portion of the public which is most interested is that which is engaged in commercial and manufacturing ventures. First of all, any diminution in the revenues of corporations of this kind must be followed by unemployment of a very large number of their operatives, and the Lord knows there is enough unemployment just now. Next, they must give a service which will be attractive and useful to the consumers of their services, if for no other purpose than to remove from the public mind additional causes of discontent. Again, they are in a very high market for money. Their extensions have been held up for years. If they are not permitted to earn high enough income to pay the higher interest rates, they cannot obtain the money for extensions.

The metropolitan city of Detroit always sets the fashion for a tax upon the utilities, because ambition to hold political jobs is always the greatest in that city, the jobs being so much more worth the holding. It is sincerely to be hoped that the attempt being made to reduce all utility rates as a question in the campaign of a candidate for office in the metropolitan city will not be imitated in other cities of the state, nor prove successful in the metropolis. These "birds" who run for public office want to make campaign funds out of other people's money but their own, and the easiest money to campaign and the easiest money to campaign on seems to be the income of the public services. Now, that money is just as necessary to industrial success and to permanent prosperity as is the money of manufacturers, and sensible people in the city of Detroit and state of Michigan will turn their thumbs down on the public performers who are anxious to ruin the public service in order that they may climb into public office.

Reducing the Motor Waist Line

IT WAS only a short time ago that the staunchest executives among the motor manufacturers ridiculed any possibility of business being benefited by price reductions. The president of

Digitized by Google

one of our important companies only two weeks ago stoutly defended the continued holding on to 1920 price schedules and a decided "not until we have to" attitude was clearly discernable in his remarks. His reasoning then was that those who could afford new cars would buy regardless, and that those who had "gone on strike" would not be converted by price concessions. And he argued further that as each successive maker cut his prices the limited buying power would flow temporarily to the newest price cutter, only to flow away from him when another over-anxious manufacturer made still further bids for the hand of the capricious purchaser.

It was a strange coincidence, therefore, that the gentle revival in the motor industry came during the period when prices were fairly evenly maintained (March and April) and that a perceptible slowing down appeared simultaneously with lowered prices. And those of the school of thought to which belongs the motor car company president referred to above took great delight in saying, "I told you so."

But events of the last ten days have rather unsettled some of these gentlemen of the old school. There is too much activity around the plants which got into line early, to make converts to the old idea, and the reappearance of new cars of several makes on our streets immediately following the price reduction has had an enlightening effect all around. Thus it is not at all surprising to hear a man high up in the automobile manufacturing business say, "Some of us have learned part of our lesson and the rest of us are trying to learn in a few months of depression what the steel industry learned by experience with many years of ups and downs."

This brings the thought, when we stop to ponder over it, that this is in fact the first experience with continued falling prices the automotive industry has encountered. Small wonder, therefore, that many of the leaders have conducted themselves like hens being shooed from dry gravel into a pond. Of course, Henry Ford was the first to try out the new surroundings, but in the automobile world his company is neither fish nor fowl and the fraternity never considers him when dipping into the economics of the the thing.

Nevertheless, in examining the swift changes that are taking place in the industry one can not avoid encountering the query: "How is the loss in gross income being offset?" To answer this, one must not only consider lower wages, materials and other costs, but must take a trip through some of the plants. He will see here and there an entire room filled with expensive furniture but devoid of anything human except perhaps a few filing girls. Where two $10,000 officials once held forth, there is now only one. Where it was formerly considered necessary to drive cars through to Buffalo on the eastward journey, some now wait for the boat lines, according to one shipping official, to save several dollars per car. In another instance a former advertising chief who was paid $10,000 a year has been replaced by the former assistant at $4,000 a year. These illustrations are only a few of the total which will come to the eyes or ears of him who seeks the answer. It is in this wise that those concerns foremost in the industry are beating the devil around the stump.

The vice-president of another corporation, an adequate description of which would be equivalent to stating its name, says: "Do not draw conclusions about the industry to hurriedly." He promises that when his concern gets through cleaning house, the public is going to have confidence in it equal to that now lodged in the U. S. Steel Corporation.

Business has felt these changes in motor car prices in a peculiar way. They have been an unmistaken signal to the restaurant man, for example, to get in line—which he has done with alacrity—and a fairly nourishing meal is now obtainable for less than fifty cents. Hair cuts are plentiful at twenty-five cents, with clothes at one's own figure, almost. Not so with shoes and rents, but the latter problem is taking care of itself better than anyone thought possible a month ago, although the operation is leaving many landlords who bought property during 1920 as shorn of net income as a sheep after the clip. In one instance, which was related by the secretary of the Bankers Trust Company, Detroit, it appears that a flat building previously returning a gross income of $2,300 a month is now rented for $1,700, and much of two months rent is past due. When the owner was asked if he could not get the overdue rent by chattle mortgages on the tenants' furniture, he replied that he had rather take the loss than be the cause of two or three suicides. Such is the effect of the price toboggan on the real estate situation. Nor are there renters waiting any more to move in where others are moving out. Whereas a year ago Detroiters going to the lakes for the summer could rent a flat for which they paid $100 a month to a summer tenant for $200 a month, desirable sub-lessees are not plentiful at the price of the first lease.

Incidentally, while the trend continues downward as to prices of all things except taxes, a new spirit of old fashioned confidence in the existing scheme of things is slowly springing up. The writer walked out Michigan a few evenings ago and mingled with a crowd being harangued by a socialist street orator. Men were drawing in and out of the throng, and it was decidedly refreshing to hear several comments such as, "old stuff" and "get something new," from some of the men who showed by their appearance that they were the very workingmen whom the speaker sought to "edify."

Two weeks ago a man who wholesales spark plugs said he was practically out of business except for his Ford account. This week he took back his stenographer in order to answer inquiries about prices and deliveries. A man who makes door checks, those formidable appearing things which lose their reputation when the garage door is encountered, related an almost identical experience, with the added encouraging feature that he already had orders which would keep him humping until the end of August.

No, the industry isn't dead; it is merely on a diet, and when it gets completely weaned from its war time bill of fare and its waist line is reduced, it is going to give a surprisingly agreeable account of itself.

Short Measure Stuff

SONNET TO A LITTLE HOUSEWIFE

I used to read and listen to Jokes tell
Of royal cooks who took some shortening.
A gooseberry and an egg, and baked the King
A pie that made the old boy rire and yell.
I always thought; That's good. It listens well.
But who believes it? Till you came one Spring
And with canned pumpkin did a marvelous thing.
A pie that simply had no parallel.

I wed you, dear, for sentimental reasons;
The charming what-do-you-call-it in your eye;
Your poppy mouth; your hair; your moody seasons
They save me from all local Lorelei.
But should you fear I plot connubial treasons,
Don't trust to these, my dear—quick, bake a pie!
—Pendello, in the Cleveland Plain Dealer.

GET A SERUM TO FIT THE CASE

Somebody is always taking the joy out of life. Now comes a state health department official who says that the typhoid prophylaxis administered to the boys when they were mustered into the service has worn off and they should all be given another shot in the arm. We are willing to bet ten years of the health officer's life that most of the bucks who took that quart of serum at one session won't be storming the medico's tent for another pumpfull.

Business Really Is on the Mend

By PHIL S. HANNA

BUSINESS is gradually getting well." This allegation was tried out on several friends this week —a motor manufacturing company official, a garage proprietor, a banker, a retailer and a blue sky promoter. You may inquire, why ask a blue sky man about business prospects? The answer is that he usually gets closest to the man with loose money. But first of all we of Detroit are interested in the financial health of the motor manufacturers and surely cannot fail to heed signs of betterment notwithstanding the action of the stock market.

So it was distinctly encouraging to hear the banker say: "The M——company now has more than half a million in cash and will soon be out of danger. Its bills are being met in a creditable way and another month as good as the last two weeks will see many of the old accounts taken care of." Continuing, this banker said: "The H——company owes very little in the way of bank loans and current bills and it has practically used up its high cost inventory, and the H——company (another concern) while not employing anywhere near its usual force, has paid off the banks, cleared up its inventory and is now in the market buying materials for a production program to start July 1. We received $300,000 'at one crack' from another motor company, so that you can tell your readers that it is our experience that the automobile manufacturers are paying their loans.

The motor company officials said: "Business is getting well because confidence in prices is gradually returning, and while I do not believe in prophesies, I like the way sales are picking up. Some jobbing concerns are beginning to give notes in payment of their accounts that have not done so heretofore, but the ones I have in mind are the lines of business which had fairly good business during the slow months with us last winter."

The garage proprietor spoke differently. At first he said he did a nice business fixing up old cars which people decided to use through the winter rather than buy new ones, "but since the price cuts," he added "we can feel the difference in this line of work. In many respects we have been made the 'goat,' for everybody and his grandfather has hung out a garage sign and the competition is simply fierce."

Nor did the retailer enthuse over the statement, although he admitted that his trade in summer clothes and hats was more satisfactory than he had expected. But here in the man who is sure that business is on the mend, although not in such a way to help his business—the blue sky man, who recited that "people seem to feel for example, that Continental Motors at 5¾ is a better buy than stuff which will pay big dividends." What better encouragement can there be, looking at the broad aspect of the situation, than to hear that investors are picking out stocks of real merit. This means also more money for good bonds, which means more money for retail trade.

It is not yet time to throw off serious restraint but the important thing now is to make sure that we notice the items of improvement as they appear. We are thus able to back up our opinions with particular examples of betterment in business. It is the safe and sane way to keep sentiment free of either unjustified optimism or pessimism. One man armed with facts can thus dispel the gloom of a dozen pessimists.

FISHER BODY STATEMENT

The Fisher Body Corporation's annual statement and report, just issued, reveals some interesting changes in that concern's financial status.

Herewith is presented the comparative income account and balance sheets of the corporation, which includes the Fisher Body Corporation, Fisher Body Company of Canada, Ltd., National Plate Glass Company, International Metal Stamping Company, Terrestrial Manufacturing Company, Shepard Art Metal Company and the England Manufacturing Company.

It is noteworthy that net profits for the fiscal year ended April 30, 1921, were $4,809,000, as compared with $4,367,000 for the year previous notwithstanding the fact that the most recent period includes about eight months of the business depression. Bank loans are reduced $7,895,000, as compared with April 30, 1920, and current assets in proportion to current liabilities are in the ratio of 32 to 11, as compared with a ratio of 45 to 20, April 30, 1920. The net earnings reported are figured after taking $1,645,000 out of income for bringing inventory down to market values.

INCOME ACCOUNT, FISCAL YEARS ENDING

	Apr. 30/21	Apr. 30/20
Net earnings, all sources, after all ordinary expenses, repairs, maintenance, renewals and depreciation	$ 9,203,960 61	$ 6,717,867 22

	$ 2,729,063 42	$ 5,992,911 27

Who's Who In Michigan Finance

Harry O. Mohrmann, Deputy Commissioner of the Banking Department

Harry Mohrmann is not from Utah. He is another successful product of northern Michigan, although the bankers have sometimes been under the impression that he came from Missouri.

In the fall of 1909 Mr. Mohrmann became a bookkeeper in the First State Bank of Central Lake, where he continued until Messrs. McPhail and Richardson established the Citizens Bank of Ellsworth nearby and he was placed in charge there of. For three years he conducted the affairs of that bank, which involved handling every department of the banking business from sweeping out in the morning to attending directors' meetings. In the fall of 1913 he became assistant cashier of the Charlevoix County Bank, Charlevoix, where he continued until January, 1917, when he became bank examiner at Lansing. In March, 1920, he became chief examiner and on June 15, 1921, was appointed deputy commissioner to succeed J. M. Conway, who resigned to enter a Detroit bank.

Michigan Bond Items

Seven hundred fifty thousand dollars of Southwestern Power & Light Company twenty-year, 8 per cent bond secured notes are being offered on an 8.10 per cent basis by Bonbright & Company and Halsey, Stuart & Company. These notes are secured by first lien and general lien bonds in the ratio of 2 to 1.

At a special election, Tuesday, June 7, the citizens of Houghton county and the city of Hancock voted on a proposal to bond both the county and city. In each case the bond issue carried. The county by a vote of 4 to 1 decided in favor of issuing $200,000 of bonds for road work. The city voted 5 to 1 in favor of a bond issue of $50,000 to run for a period of 20 years. This money is to be used for the purpose of paying off accumulated debts and for street and alley improvement.

A $60,000 issue of Macomb county hospital, 6 per cent bonds were sold June 10 at private sale to the Citizens Savings Bank, Mount Clemens, at par. Bids on these bonds were received June 2. The best proposal at that time was about $1,000 below par and all bids were rejected and the county building committee instructed to readvertise for bids to be opened June 25. The offer at par came unexpectedly from the bank and was made subject to immediate acceptance.

The Macomb county road commission, Mount Clemens, will receive bids on June 20 on $400,000 of road bonds bearing 6 per cent interest.

The Gladstone State Savings Bank, Gladstone, has purchased a $175,000 city bond issue for the erection of a junior high and grade school. This is said to be one of the largest bond purchases made in that part of Michigan by a bank in many years. W. W. Gasser, who represented the bank, appeared before the members of the board of education and announced the bank's proposal to carry the bonds at a rate of 6 per cent interest. It was not the intention of the bank to float the bonds but to carry them to maturity.

The Guaranty Trust Company of New York was the successful bidder for $2,000,000 of Detroit municipal railway bonds, June 14, paying therefor at the rate of 100.25. The issue was divided into two equal parts, the first bearing interest at the rate of 6½ per cent and the remainder carrying 6 per cent.

M. A. YOUNG TO RETIRE

M. A. Young, one of Detroit's pioneer automobile dealers—having launched in the business in 1900—is retiring July 1. He will lease his large sales and service building in Woodward avenue and take a long vacation. Mr. Young's first location was at 127-29 Grand River avenue, where he handled the Elmore two-cycle car. Next he was at 254 Jefferson avenue. In 1910 he located at 754-58 Woodward avenue, where he remained nine years, selling the Elmore, Mitchell and Reo. In 1919 Mr. Young built his present building, in which he has been handling the Peerless and Chandler.

BUICK HAS BIG DRIVEAWAY

During the latter part of the week 500 Buick cars were driven from Flint to Chicago for distribution in that territory. This fleet of cars was one of the largest ever sent away from the factory.

REED FURNITURE PLANT REOPENS

Business in sight and contracted for has prompted the Ypsilanti Reed Furniture Company to reopen the Portland factory on a full working day schedule with 90 employes.

Business Meets New Conditions

American business has been clearing decks. Budgets have been revised. Every buying, selling and production unit has been overhauled and made ready for intensive service. Economy has been the test—economy of time and effort.

In any study of functions and readjusting of methods, the work done by your bank balance should not be overlooked. Has it been merely a checking account and a basis for commercial credit? Or has it brought to the aid of your organization other constructive services? Are you making use now of all the help it should provide?

Many business men who carry deposits with the Irving or with Irving correspondents have discovered broader service possibilities in their banking connections. The Irving investigates markets as well as credits, expedites deliveries of merchandise as well as collections, supplements the information resources of its customers both in domestic and foreign fields. Every transaction it undertakes, either at home or over-seas, is handled with a clear understanding of business essentials as well as careful attention to banking requirements.

WILLYS-OVERLAND FINANCING

Plans are taking form for the clearing up of the financial problems of the Willys-Overland Company, Toledo, says the Chicago Journal of Commerce, particularly with regard to taking care of the corporation's bank loans, which fell due early in the year. Representatives of the banks directly interested have been holding a series of conferences and have practically agreed upon a plan which, it is believed, will adequately meet the situation. The company has steadily improved its position since the beginning of the year and at present has cash on hand equal to approximately 35 per cent of the $21,000,000 of bank loans outstanding. Moreover, the company, by reason of the drastic slashing of inventories at the start of the year, is now in a position where it can produce cars at a reasonable profit.

HOSSICK'S NEW CONNECTION

Fenn H. Hossick, who for some years has had charge of all direct mail literature for the Burroughs Adding Machine Company, has joined the staff of the Power, Alexander & Jenkins Company, Detroit advertising agency. Mr. Hossick, who has had a wide experience in the newspaper and advertising fields, was for a time assistant advertising manager of the Nash Motors Company, Kenosha, Wis.

SPEIR TALKS TO INSURANCE MEN

Robert Y. Speir, vice president of the Capital National Bank, Lansing, was the principal speaker at a banquet given last week by Clare Lamoreaux, superintendent of agents for the Detroit Life Insurance Company in honor of M. E. O'Brien, president of the company, who visited the capitol in company with other Detroit Life officials. Mr. Speir's topic was: "The Relation of the Bank to the Life Insurance Solicitor," and he paid a high tribute to the life insurance profession, saying in particular: "Life insurance as an augmentation of the merit of collateral cannot be underestimated" and "a very practical way for a life insurance solicitor to get properly established with a banking institution is to maintain a substantial working account with the banks. While all banks like all the business they can get, large and small, an average checking balance of $200 is looked upon as of importance enough to warrant special consideration from the officials of the banks. Therefore the agent who maintains such a balance always may reasonably look for especial consideration when he desires to have his notes handled. The agent who makes it his particular business never to turn over notes excepting when he is reasonably certain that the bank can collect on them readily, establishes himself on a firm foundation with the bank."

Special Session Adjourns After Passing 33 Measures

Of the 72 measures submitted to the legislature at the special session, which closed last week, thirty-three were passed. The most important of these were the soldiers' bonus and that providing for an income tax amendment plan to be submitted to the voters.

The bonus bill was introduced in the House by Rep. Vincent P. Dacey, Detroit. The hottest fight was over the bond provision of the bill. As finally passed, the measure provides for a $30,000,000 issue for a straight thirty years from next July, at 5½ per cent interest. The state administrative board is empowered to create a sinking fund to buy back these bonds, or it may invest the money in other public securities, the interest from which would offset that on the bonds. Every ex-service man will be entitled to $15 a month for service between April 6, 1917, and Nov. 11, 1918. Dependents of those killed or who died will receive the same amount from the date of enlistment to August 1, 1919.

Rep. Peter Lennon, Genesee, introduced the income tax amendment, which will be placed before the voters at the general election in November, 1922. The amendment authorizes the legislature in its discretion to enact an income tax law. This tax may not exceed 4 per cent upon or with respect to gains, profits and incomes. The tax may be graduated and progressive and may provide for reasonable exemptions. For the purposes of such tax, property and persons, firms and corporations upon which such tax may operate may be classified.

The Wood bill, which was passed, is aimed at the alleged sprinkler trust, and provides for a sprinkler head commission, to comprise the state insurance commissioner and the deans of engineering at the University of Michigan and Michigan Agricultural College. This commission will pass on all sprinkler heads and when approved, insurance companies will be obliged to give the same decreased rate of insurance. If an insurance company gives preferential rates to any sprinkler company, as now claimed, a penalty of $1,000 fine is fixed for each offense.

The second proposed constitutional amendment was passed to authorize the legislature to establish ports and port districts so Michigan will be in readiness to take immediate advantage of the Great Lakes-St. Lawrence deep waterways project when completed. This amendment will also go to the voters at the election in November, 1922.

Additional appropriation and other bills were included in the measures passed.

ELLIS DEPOSITORS TO GET INTEREST

Depositors in the private bank of George E. Ellis, Grand Rapids, which was closed upon Mr. Ellis' death, will receive their regular 4 per cent interest up to July 29, the final date for filing of claims against the estate, according to Probate Judge Clark E. Higbee. The appraisers of the estate have undertaken a very difficult task, having found it necessary to fix a reliable valuation on more than 5,000 individual notes and the securities back of each.

EDGE ACT AMENDMENT PASSES

The amendment to the Edge Act providing that only 25 per cent of the capital of corporations organized under this law (foreign trade banks) is necessary to be paid in at the commencement of business and that the remainder may be made subject to call by the boards of directors of such corporations with consent of the Federal Reserve Board, has passed both the Senate and House of Representatives at Washington. It is expected that this change in the law will facilitate organization of the $100,000,000 Foreign Trade Financing Corporation.

FOR HUMANITY'S SAKE

A strange reason, you may think, to give for recommending compensation insurance in one company rather than in another.

Yes, it is perfectly logical. Surely it is humanity to save life—to prevent needless maiming and crippling.

An insurance company may wield a great power in accomplishing just this.

The great majority of industrial accidents, which kill and maim thousands annually, causing untold suffering and the loss of millions of dollars, are preventable.

A compensation insurance company, through its accurate records of thousands of accidents, is able to analyze the causes and devise practical means of preventing the greater number of them.

But many companies apparently use this information respecting accidents, their cause and their cost, solely for the purpose of determining adequate rates so that they themselves may be protected from loss.

Their enormous potential power for good is too frequently neglected or exerted in the most perfunctory way, perhaps because they lack a proper appreciation of the vital importance of such work. Or it may be due to a lack of the necessary equipment or organization.

The Michigan Mutual maintains the most complete organization for the promotion of safety in the plants of its policyholders, and prosecutes this work more vigorously than any other company operating in Michigan today.

Think what a saving in human suffering and money cost will follow the prevention of even a small part of the easily avoidable accidents.

Let us tell you more about this and other features of our compensation insurance protection. Write now. A postal will do.

Every policy shares in savings.

Every policy is non-assessable.

1921 B. of C. Cruise Was a Real Holiday

Although the eighteenth anniversary cruise of the Detroit Board of Commerce has fulfilled its mission and retired into the realm of history there remains the motion picture review for those who could not go, and there will linger for some time in the minds of those who did go a memory of the best cruise ever conducted. Owen Sound and Killarney, in Georgian Bay, the only ports of call, have seen Detroit business in holiday mood, and Detroit business has been entertained well and been impressed by the two communities.

When the S. S. Noronic cast its hausers ashore at Owen Sound the Detroiters were imbued with a desire to impress the citizens with the progressive and energetic character of Detroit. On the other hand, Owen Sound had prepared to show Detroit's representatives a city of no mean industrial advantages and advancement. The admiration was mutual. Owen Sound's citizens talked of the advantages of the city as a location for the woodworking industry because of its cheap hydro-electric power and its abundant supply of timber, and evinced a keen desire to get some of Detroit's industrial energy. The city has numerous industries, among them the National Bent Chair Company, one of the largest chair manufacturing plants on the continent.

However, the Detroit cruisers were not in a business mood. The trip was for relaxation. The committee in charge provided an excellent program of deck sports, vaudeville and some addresses. The picnic at Killarney was enough some of the most beautiful Great Lakes scenery, which seemed to reach a sublime degree among the many islands in Georgian Bay. The last stop and the longest visit was at Owen Sound, where dinner was served to 700 visitors. At Killarney an Indian band provided music for the entertainment of the visitors, and at Owen Sound a kiltie band of pipers performed this duty. On board the ship an orchestra and a quartet provided the musical entertainment. For the trip back up the cruise motion pictures were part of the entertainment.

The ship left Detroit Thursday evening and Owen Sound Sunday, docking at Detroit Monday morning. W. A. C. Miller was chairman of the cruise committee.

FIFTY A. I. B.'s GOING TO MINNEAPOLIS

According to Frank J. Maurice, of the Detroit Federal Reserve Bank, who is in charge of arrangements, members of the Detroit Chapter of the American Institute of Banking and their wives to the number of 50 have signed up for the trip to the annual convention, in Minneapolis, in July.

The delegation will leave Detroit, July 16, at 11:30 p. m. over the Michigan Central for Chicago, where it will join other delegates in special cars routed via Milwaukee, where a day will be spent as guests of the Milwaukee chapter, the body reaching destination the third day at 10 a. m., via C. & N. W. Ry. A fare of $57.45 for the round trip (fare and one-half including Pullman) has been obtained. Expenses while in Minneapolis are estimated at about $40; thus it is expected that one may make the trip for a total outlay of $115. Plans have also been made so that delegates may return from Duluth via the Anchor Line steamer Jaunita, which boat has been chartered by the New York chapter. Those choosing this route for the return trip should expect a total expense of $135, as the fare and one-half rates does not apply in this case.

N. D. CROP PROSPECTS GOOD

A letter just received from J. J. Earley, president of the North Dakota Bankers Association, refers to crop prospects in that state as follows: "Crop prospects are excellent; I have never seen them better, and the cost of operation in putting in the crop has been less than half that of recent years. Practically no new machinery is being purchased at all. Labor is not much more than half last year's scale and its efficiency is greatly increased. This favorable crop condition applies over the entire state and in Montana, thus covering sections which need it much more than we do."

STRAUS & CO. ANNOUNCE PROJECTS

S. W. Straus & Company have announced that they have underwritten recently first mortgage bond issues on new housing projects in a number of American cities aggregating $6,823,000.

S. S. KRESGE CO. SALES

The S. S. Kresge Company, Detroit, whose stock is listed on the Detroit Stock Exchange, reports May sales as having totaled $4,232,289, which is an increase of 5.09 per cent over those of May, 1920. The increase in sales for the year to date is 10.05 per cent over the corresponding period last year.

W. J. ORR DIES

W. J. Orr, president of the Michigan Bean Jobbers Association and partner with former Governor Sleeper in several Michigan banks, died last Sunday at his home in Saginaw.

GERMANY BEST COPPER CUSTOMER

According to the Houghton, Mich., Mining Gazette, Germany in April ranked as our best customer for refined copper, taking 15,837,896 pounds, or 39 per cent of our total exports of copper for that month. In March the total was 52 per cent. During ten months ended with April, Germany imported 106,712,675 pounds of copper from the United States, or 22 per cent of our total exports of that metal during that period. France was second with 100,148,411 and United Kingdom third with 81,616,533.

CITIES SERVICE SHARES BREAK

Announcement that the Cities Service Company would pay the current dividend in script resulted in new low sales this week, bankers shares touching 12½ and the old common 110. President Doherty explains that the action was taken to preserve cash resources of the company and comments on the oil situation as follows: "Oil consumption is gaining at a rapid pace, giving promise of soon outrunning even our present record of production. Drilling is falling off at a rapid rate and as much of our present production is flush production, fully one-third of all the production east of the Rockies being from wells drilled in the last year and fully 50 per cent from wells drilled in the last two years, we are bound soon to have a falling off in production at a phenomenal rate."

EXTRAORDINARY RECORD

The history of the various Sterling Loans to China dates back 35 years with an uninterrupted record of prompt payment of principal and interest.

These 5% **Chinese Sterling Bonds** now available at 55c on the dollar, together with the **ARGENTINE, BRAZILIAN, and CHILEAN Sterling Bonds**, constitute the outstanding investment values of the greatest bargain bond market of history.

They pay 8.63% annual cash income from coupon.

They should yield 72% profit in addition.

How Increase Bond Distribution?

(*Continued from Page 7*)

such as these organizations alone can put over, and without which the limited efforts of even the largest of us will be restricted to but a narrow slice of the great field that needs to be covered. Let's have the campaign extend to the schools and to the colleges; let's preach the doctrine that it's just as important to know how to conserve one's earnings as it is to know how to accumulate them.

As for better advertising there is much to be said, though little time to say it. Let's get back to the fundamental faults of present bond advertising, as were so admirably pointed out by Herbert Mulford in a recent article in the Investment Bankers Association Bulletin. As he suggested, let's start by making ourselves better advertising men so that we can command from our associates and supporters the respect for ourselves and the consideration for advertising which is the custom in other lines of business. Let's demand and get from our agency connections the same type of service power that it now is. Let's get our appropriations related to our sales so that the question of how much we shall spend for advertising will be automatically settled once a year and not be a recurring source of argument. Let's realize the value of large space, of continuity of effective illustrations and expert typographical arrangements. Let's cease to be the "fall guys" of the advertising world and cut our Ladies Aid Society programs, etc., and insist on knowing the circulation that we are buying from financial publications such as has been required for years among practically all other advertisers except financial.

Let's get over the idea that we have a monopoly of the world's supply of dignity and come down to earth with our copy. Let's not forget that our market today is not a restricted body of experienced and wealthy buyers but a body composed of millions of average Americans who need education and confidence to make them consistent bond buyers. We have one of the most advertisable commodities in the market. More and better advertising will put it where it belongs.

Just a word in closing as to why we should endeavor to increase bond distribution. If the question were one of selfish interest only, i. e. one affecting merely the interest of those of us who are engaged in bond distribution, I should say that the subject is, after all, not one of such vital concern as I have endeavored to portray it. But it is not one of selfish interest merely, it is rather a matter affecting our national well being.

Consider for a moment the stupendous requirements of our own government and of other governments who look to us for help in the next few years. Consider the impoverished condition of our railroads and many of our utilities, and the vast sums which will be necessary to put them where they belong. Consider the requirements of our industries for refunding the debt incurred during the war time period of feverish activity, to say nothing of their normal requirements for development, which will inevitably come with the reawakening of business. Consider these items and you will agree that this question of increasing bond distribution is not one affecting only those who will be benefitted through the act of distribution. It is instead one affecting our national interests and as such it challenges the best thought and most earnest endeavor of those upon whom in large measure rests the responsibility for the successful completion of this great task of finding a market for the bonds which must be sold in the next few years to meet the need which will inevitably arise.

An address delivered at the convention of the Associated Advertising Clubs of the World, at Atlanta, Ga., June 14.

NEW MAXWELL STOCK LISTED

New York Stock Exchange has admitted to list Maxwell Motor Corporation (West Virginia) temporary certificates for Class A and Class B stock and has stricken from list Maxwell-Chalmers Corporation 8 per cent preferred stock Class A, when issued, and common stock Class B, when issued. Further transactions in the latter may be settled by delivery of Maxwell Motor Corporation Class A and Class B stock respectively upon the seller's giving the buyer one day's written notice of his intention to make delivery.

Speeding Delivery Of Small-Lot Freight

(*Continued from Page 7*)

ments are again lifted by crane to motor trucks, taken to the doors of consignees, unloaded and then returned to the railroad cars either light or reloaded.

Time-saving at every stage is the primary object of the container-car system of store-door delivery. First of all, exponents of the system point out, time is saved at the shipping point because elimination of rehandlings between shipping and receiving points makes crating of products unnecessary; elimination of rehandlings and checking makes necessary the services of fewer truckers and clerks, and immediate unloading of goods at store doors eliminates the item of demurrage, at the same time promptly releasing freight cars, clearing yard tracks of idle cars and reducing congestion at freight station platforms.

Container cars are of two types, one designed to carry express and the other freight. Each of the nine compartments of the express type car has a capacity of three tons. The freight train type of car carries compartments of two sizes and can accommodate two large and two small, one large and four small, or six small removable sections. The capacity of the small size section is 2,500 pounds, and of the large section, 7,000 pounds.

The steel compartments, besides being fireproof and weather-tight, are made burglar-proof by setting them on to the cars in such a manner that the doors, even if they could be unlocked, could not be opened without hoisting the whole compartment above the steel bulkhead behind which it fits.

For the express type of car one of the fields of potential usefulness in the United States mail service. Container car service already has been tried out in the shipment of magazines and periodicals from New York to Chicago. One express car, its nine compartments filled with mail, left New York at 5 a. m. one day and arrived in Chicago at 8 a. m. the next. The mail was then taken by motor trucks to the post office.

On the first trial trip between Chicago and Cleveland with groceries from Reid, Murdoch & Company to its Cleveland branch, three to eight minutes were consumed transferring each compartment from freight car to motor truck and five or six minutes lifting each loaded "vault" to the car. Loading of the compartments took about half an hour.

Returning from Cleveland to Chicago, one large compartment carried battery parts from the Willard Storage Battery Company to its Chicago branch, another contained paint from the Tropical Paint & Oil Company for its Chicago branch, while a third small compartment carried dental gas in crated cylinders from the Ohio Chemical & Manufacturing Company for its Chicago branch.

Every article shipped reached its destination in first class condition and in the same position in which it had been placed at the shipping point.

PENINSULAR WINS SUIT

Judge Vanderwerp has directed a judgment of $22,322 in favor of the Peninsular Smelting & Refining Company against the Muskegon Aluminum Company, according to the Muskegon Chronicle.

"The judgment was for the full amount asked with interest," says the paper. "The Detroit concern contracted with the local company to sell it a quantity of aluminum at a stated price, and it was charged that when the business depression came the local concern failed to carry out its contract. As a result, the Detroit firm sued, alleging damages, and the court, after hearing the testimony, directed that the jury return a judgment for the full amount and interest."

Guidance, Custody and Care of Investments

The National Bank of Commerce in New York, through its Bond Department, supplies to its friends complete information on all investment securities.

Services of experienced men are available to guide in properly balancing and adapting investments to suit particular needs.

The large volume of investments handled through us insures close quotations and efficient brokerage service. We are in a position to give impartial counsel on investment matters.

Securities may be left in our care for collection of coupons and owners will be advised as to income tax certificates, announcement of "rights," conversion privileges and exchange for new forms.

certain localities and the political pressure that would be brought to bear. It is quite natural for the civic spirit of a community to be manifest in a desire to have a multitude of steamship services, but it is not sound business unless cargo is obtainable at the ports of loading.

The Shipping Board, as owners of the steamers, when assigning steamers to loading brokers to operate for their account on a designated trade route, should stipulate a trade name under which the line will operate, this to be the property of the Shipping Board; and should they eventually sell these steamers operating in this trade, the trade name should go with the line. It is a well known fact that some Shipping Board operators have obtained tonnage to operate in special trades with a view to keeping these trades in their hands until such time as foreign lines and owners are in a position to supply tonnage. In some notable instances American owners obtained allocation of Shipping Board vessels until such time as they could buy or charter foreign ships and operate them on routes in which American ships were employed. An instance of this, and serious commentary on the economic results of the war, is the recent appearance of former Hansa Line steamers in the trade from the United States to India. The German ship owners, having been reimbursed by their government for ships lost or taken over by England under reparations, are now operating their former steamers under British registry, the steamers having been sold by the British government at one-third of their original cost.

Until trade revives and opportunity exists for obtaining a fair sales price, an early retirement of the Shipping Board and liquidation of its shipping business seems impracticable, but a partial solution of one of the difficulties confronting the Shipping Board is to continue to lay up a considerable portion of their tonnage, and, in line with the timely advice, "Government in business, more business in government," withdraw from all but supervision activity by chartering the steamers to reputable and experienced operators, either on a bare boat basis or on time charter, allowing the charterers the option of purchasing the steamers when conditions improve.

The claim is made, and justly, that the cost of American ships must reasonably approximate the costs of their competitors, and that capital charges must be substantially equalized with those of our competitors. The fact remains that while a considerable number of ships built abroad have been sold under stress of necessity at less than half the cost of reproduction, as in the case of ex-enemy ships sold by Great Britain, the great bulk of the world's tonnage built during the war fairly approximates the average cost of our own fleet. Again it is said that operating costs must be approximately equal to those of our competitors. Leaving wages paid in American ships out of consideration, does the foreigner, loading from American ports, obtain any lower prices for fuel, ship repairs, wharfage, harbor dues, stevedoring, supplies and stores in United States ports than do our own ships?

Shipping Laws the Main Factor

The main factor in determining whether we can compete successfully lies largely in our shipping laws. The latter are not only strangling our ocean-going ships but are affecting our carriers on the Great Lakes. It may be tacitly assumed that our ships must be manned by competent crews sufficient in number to operate economically and safely, and that American seamen should enjoy the best possible conditions receiving in wages reasonable return for service performed; but it must be equally obvious that provisions of law which require American vessels to maintain larger crews—65 per cent of whom must be licensed men—than is the case with foreign vessels and to carry as the engine room crew 30 per cent more men than the steamships of any other nation, necessarily subject American vessels to a very serious disadvantage, estimated at 5 per cent on the operating expenses. The compulsory advance in each foreign port of call of half wages earned seriously affects the working of ships and leads to expensive delays. The burden of these laws should be removed in the interest of the seamen as well as the ship owners. Their removal would appreciably improve our position and make it unnecessary to discriminate against our competitors by legislation which they are in position to adopt similarly against American goods and vessels in foreign ports, since of necessity we must have return as well as outward cargoes. Congress has declared in favor of a policy of private ownership "as soon as practicable," but it is not practicable to sell the ships in the United States in advance of legislation which will make it possible to operate under conditions which are sure to prevail as soon as the abnormal situation resulting from the war comes to an end. It therefore seems that the problem of the moment is the formulation of measures which will put American ships and American shipbuilding upon such a basis that it can compete successfully with the ships of other nations. To sell the fleet, which cost the taxpayers of the United States more than three billion dollars, without legislation revising our navigation laws is impossible. Without this legislation and revision making it profitable to our citizens to operate these ships, it will mean that these ships will ultimately fall into disuse or find their way into the hands of foreigners at breaking-up prices, to confront us later with real examples in cost of operation based upon the then capital charges.

American marine insurance companies are at a disadvantage caused by non-uniformity of state laws and excessive taxation which place American companies at a disadvantage with the foreign insurance markets in which they compete. Those disabilities should be removed by state and federal governments. Telegraphic communication from the United States to foreign countries should be under American control; it is essential to our marine development and foreign expansion.

As stated, a large amount of tonnage would undoubtedly have been disposed of a year or more after the Armistice if the opportunity had been taken advantage of. But it was not, and while the cost of the ships will be written down eventually to a reasonable figure, the ships cannot be sold until a market exists for them and until that the investors will not furnish the money to buy them. Meanwhile they will at least save the Government large outlay in carrying on their present plan of operation, if chartered to shipping people on a competitive bare boat basis. This will relieve the Government of expense and enable them to earn a moderate revenue. Large numbers of foreign ships similar to the so-called Lake type are under charter to Americans in the Cuban sugar and nearby trades which could be covered by American vessels.

The bare boat charter basis with an early revision of our navigation laws, the latter an urgent requirement of the situation—might be called a plan to enable shipping people to send our ships to sea upon terms of equality.

An address delivered by Mr. Farrell, as chairman of the National Foreign Trade Council, at the recent Eighth National Foreign Trade Convention, in Cleveland.

Banks and Bankers

NATIONAL CITY CHANGES SYSTEM

Directors of the National City Bank, New York, the largest bank in this country, have discarded the executive management system and have installed in its place the direct control arrangement, which obtains in nearly all large American banks. By reason of the change, Charles E. Mitchell, who succeeded James A. Stillman recently as president, becomes the chief of the institution in fact as well as name. The directors of the National City Company adopted similar changes and elected Eric Swenson president of that company to succeed Mr. Mitchell.

BIRCH RUN STATE'S NEW BUILDING

The Birch Run State Bank, of which R. G. Frost is cashier, held open house all day Thursday, June 9, to customers, bankers and business friends from surrounding cities in dedication of its building, recently completed at a cost of $30,000. Among the visitors were Henry T. Robinson, Saginaw, cashier of the American State Bank; Peter Pardee, Reese, and Grant J. Brown, cashier of the Industrial Savings Bank, Flint. At 7 p. m. a splendid banquet was served. This bank is rapidly approaching the half million class as to total assets. Chas. Wolohan is president; William P. McGregor, vice-president; R. G. Frost, cashier, and Herbert Walter, assistant cashier.

DUNHAM WINS KICKERS' TROPHY

Owing to threatening weather last Wednesday only a small number of golf enthusiasts turned out for the Kickers' golf competition held at the Detroit Golf Club for the visiting members of the Michigan Bankers' Association. Walter L. Dunham, of the Dime Savings Bank, won the cup with a gross score of 100, net 85. W. K. Prudden, Lansing, won second prize, with a net of 86.

1921 DIRECTORY ISSUED

The Grand Rapids National City Bank has issued its sixteenth annual Michigan bank directory. The booklet is of the pocket size and gives the following information for each institution. City, county, population of the town or city, name of the bank, year of its organization, capitalization, surplus and profits, total deposits, loans, name of the officers and names of correspondents. The statistical data was compiled by Bertrand Vander Meulen The directory will be mailed upon request.

JUNIOR BANKERS MEET

The June meeting of the Junior Bankers Club of Detroit was held June 8 at the Detroit Yacht Club and was attended by about thirty-six members, who indulged in a question box free-for-all after a splendid dinner. The questions asked covered matters relative to the law of bills and notes and negotiable instruments. Each member was furnished with a question and asked to give his answer. Ralph Clark, assistant prosecuting attorney, and Carl Wisner, of the American Loan & Trust Company, assisted in answering questions. John B. Dew, of the Federal Reserve Bank, talked on the proposition of simplifying legal procedure. It was decided to hold a summer outing late this month at one of the nearby resorts, concerning which president Frank C. Thomas will send information to the members.

MICHIGAN BRASS AND IRON

The Michigan Brass & Iron Works, Lansing, is operating on a 55 per cent production basis, with prospects that this will be increased soon. The company depends largely on local automobile concerns.

THE OLDEST HOUSE IN MICHIGAN

Canadian Funds

American shareholders in Canadian Corporations may avoid over *11% discount* on their dividends by purchasing Government or Provincial bonds.

Motor Price Cuts Announced

(*Continued from Page* 11)

The Saxon Motor Car Corporation, Detroit, which in January reduced its prices $220 to $320, announced another cut a few days ago of $180. Present and former prices are as follows:

Model	New Prices	Old Prices	Reduction
Touring	$1,495	$1,675	$180
Sedan	2,295	2,475	180
Coupe	2,295	2,475	180
Blackstone	1,895	2,075	180

The biggest price cut announced by any manufacturer during the last eight weeks has been made by the Stanley Motor Carriage Company, Newton, Mass., which makes the Stanley steam cars. The reductions ranges from $1,125 to $1,925. New and old prices are:

Model	New Prices	Old Prices	Reduction
5-Passenger Touring	$2,600	$3,950	$1,350
7-Passenger Touring	2,600	3,950	1,350
4-Passenger Coupe	2,725	3,650	1,175
7-Passenger Sedan	3,850	5,775	1,925
Chassis	2,475	3,600	1,125

The Cleveland Automobile Company, Cleveland, has reduced prices from $170 to $180, as follows:

Model	New Prices	Old Prices	Reduction
5-Passenger Touring	$1,295	$1,465	$170
5-Passenger Roadster	1,295	1,465	170
4-Passenger Coupe	2,195	2,375	180
5-Passenger Sedan	2,475	2,655	180

Mixed conditions characterized the automotive industry during May, according to the monthly analysis made public this week by the Motor & Accessory Manufacturers' Association.

The "temperature chart" of the industry, showing in statistical form month-to-month purchases by automobile passenger car and motor truck makers from 300 parts and accessory manufacturers was made public for the first time, covering the period from January 1 to the end of April. Since this survey was not inaugurated until 1921, there is no basis for comparison with last year's figures.

This chart shows three curves—the sales of parts and equipment to vehicle manufacturers, the total of past due accounts reported and the total of notes outstanding. In all three items the curve from the beginning of January to the end of April indicates basically healthy and progressively improving conditions in the industry, with increasing confidence in the restoration of a safe and sane normal.

The totals of past due accounts and notes outstanding showed substantial decrease for the same period, thus indicating that the bed rock financial factors in the automobile industry have been improving steadily and soundly. The figures follow:

Month	Total Purchases Per Cent Change	Total Past Due Accts Per Cent Change	Total Notes Outstand'g Per Cent Change
February	66.15 Inc.	37.12 Dec.	25.5 Inc.
March	34.20 Inc.	16.57 Dec.	16.35 Dec.
April	32.93 Inc.	4.49 Dec.	5.94 Inc.

Since close to 400 of the principal parts makers are affiliated with the Motor & Accessory Manufacturers Association, figures thus reported are a sensitive gauge of conditions throughout the industry. Monthly conferences are held for the interchange of credit information and the pooling of experiences, thus making possible a scientific and impartial diagnosis of current trends.

Although the fundamental conditions as reflected by the above figures are constructive and reassuring, there are several features of a less favorable character. No effort is made by reporting members of the Association to cloak or minimize the realities of the present situation with respect to general business conditions. Many reports from Detroit and other automotive centers indicate that the manufacturing revival reported last month has not been generally maintained. There are, of course, concerns going ahead with their schedules but others report further curtailment of orders and cancellations of old releases.

Recent price revisions of vehicle makers have tended to stabilize conditions but this process of adjustment cannot be completed over night. The industry is eagerly scanning the commercial horizon for evidence of increased sales which the new price levels were designed to stimulate.

The most significant reports already received along this line come from the south and show a gratifying tendency on the part of the public to translate needs for automotive transportation into purchases of vehicles.

The National Automobile Chamber of Commerce, which embraces the principal makers of cars and trucks, is authority for the statement that the automotive market is a leader in the return of buying. Evidence to this effect was brought out by the principal executives of the industry who were in New York a few days ago for the annual meeting of the Chamber.

May Shipments

The May automobile shipments from factories exceeded April by 13 per cent and April and May shipments were 67 per cent of the same months of last year, comparing favorably with the steel market, which is on a 30 per cent basis; with pig iron, which is on a 50 per cent basis, and with rail transportation, which is on a 60 per cent basis.

Addressing the annual meeting of the National Automobile Chamber of Commerce, W. P. G. Harding, governor of the Federal Reserve Board, pointed out the encouraging elements of strength in the present situation.

"The steps in the general public order," he said, "that things are constantly going lower and lower," said Governor Harding, "and we should get some stability into the situation."

It was the opinion of the meeting that the

KANSAS COURT UPHELD

Constitutionality of the Kansas court of industrial relations law, sponsored by Gov. Henry J. Allen, has just been upheld on eight distinct points in an unanimous decision handed down by the state supreme court in sentencing Alexander Howat, mine workers' leader, to one year in jail for contempt of court.

The decision contained quotations from many other cases, with alleged instances of conditions in strikes in various parts of the country. That the case ultimately will be brought to the United States supreme court if the state supreme court refuses a rehearing was the statement in Kansas City, Mo., of Redmond S. Brennan, attorney for Howat, who was sentenced after he had disregarded the court's ruling in calling the miners' strikes in Kansas.

GREAT LAKES ROUTE FEASIBLE

Col. W. P. Wooten, U. S. Engineers, who with a Canadian engineer has been making a survey of the route of the proposed Great Lakes-St. Lawrence deep waterway, reported last week to the inland waterways committee of the Detroit Board of Commerce that the project was feasible from engineering and financial standpoints. Col. Wooten's formal report will be submitted to the International Joint Commission, which probably will make it public

NEW GRAND RAPIDS RATES

The Consumers Power Company has published new rates for Grand Rapids. The minimum charge on power current is reduced from 11 to 50 cents per horsepower connected load, with an option of a fixed charge of $5. The lighting service rate has been restored to eight, six and four cents on a basis of 60 instead of 30 hours. Recently the courts denied the city's petition for an injunction restraining the company from charging a flat rate of eight cents. The decision has been appealed

new low price levels now reached probably would be stabilized on the present basis, as almost all the motor companies had readjusted their prices. The consensus of opinion brought out that the motor car and truck companies had anticipated the lower levels of raw materials and had priced their product on the new basis.

"The public has a great deal of buying power left," said Governor Harding, "and buying power begets buying power. You start up one industry and you automatically start up another. It is amazing when you consider the automobile industry to find how many things are dependent upon its prosperity. It affects the purchases of steel and all the processes of steel manufacture. See how much employment that gives to labor."

The Chandler Motor Car Company, Cleveland, has reduced its prices $145, effective June 13. Three of the models—the two roadsters and the touring car—now are back at the 1913 level. The revised and former prices are as follows:

Models	New Prices	Old Prices	Reduction
7-Passenger Touring	$1,785	$1,930	$145
2-Passenger Roadster	1,785	1,930	145
4-Passenger Roadster	1,795	1,930	145
4-Passenger Phaeton	1,865	2,010	145
4-Passenger Coupe	2,785	2,930	145
7-Passenger Sedan	2,885	3,030	145
Limousine	3,385	3,530	145

Price reductions ranging from $100 to $900 have been made by the International Harvester Company on its line of International trucks. New and old prices are:

Capacity Model	Tires	New Prices	Old Prices	Reduction
1/2	6,000 Solid	$3,600	$4,500	$900
61	6,000 Cord	2,750	3,450	700
41	4,000 Cord	2,325	2,900	575
31	3,000 Cord	2,032	2,425	393
21	2,000 Cord	1,871	2,160	289
61	6,000 Solid	2,490	2,890	400
41	4,000 Solid	2,100	2,400	300
31	3,000 Solid	1,850	2,050	200
21	2,000 Solid	1,750	1,850	100
New	1,500 Cord	1,000	...	...

Under date of June 5, W. B. Canfield, sales manager of the Auto Sales Company, Wheeling, W. Va., distributor for the Overland and Willys-Knight, stated to the Wheeling Sunday News that the company's business this year has been the greatest in its history. The reason, he said, was the recent price reduction.

"The big decrease in the price of the cars has caused an influx of buyers; in fact, we have so many orders at the present time that the factory cannot fill them," said Mr. Canfield "From May 15 to June 1 we sold 450 cars outright. However, orders were taken for more than that number. Sale of used cars is also setting a precedent. Since June 1 we have sold eighteen second-hand cars, and indications are that at least 200 will be disposed of this month."

The Marmon Chicago Company, Inc., announced Saturday that since the price reduction of the Marmon line announced May 2 the distributor had sold 121 cars.

The Lee Motor Company, Inc., St. Louis, Mo., has reduced the price of its open cars $200. No announcement has as yet been made as to a change in price on the closed models. New and old prices are:

Models	New Prices	Old Prices	Reduction
7-passenger	$988	$1,188	$200
Roadster	988	1,188	200

The National Motor Car & Vehicle Company, Indianapolis, Ind., announces a reduction of $750 and $560 respectively on its open and closed models, taking effect July 2. New and old prices are:

Models	New Prices	Old Prices	Reduction

General Financial News

$800,000 ISSUE APPROVED

The Michigan Securities Commission has approved an $800,000 issue of additional stock of the Wolverine Insurance Company, which writes all kinds of automobile insurance and business fire risks. The stock will be disposed of in blocks as authorized by the directors. The new issue places the company in the million-dollar class.

INTERNATIONAL NICKEL

For the year ended March 31 the International Nickel Company reports surplus, after charges and federal taxes, of $2,029,700. This, after deduction of preferred dividends, is equal to $0 cents a share on the $41,834,600 of common stock outstanding.

JACKSON CREDIT MEN ORGANIZE

The Jackson Credit Men's Club has been organized in Jackson. L. F. Bomhoff, of the Jaxon Steel Products Company was elected president; C. C. Hart, of the American Oil Corporation, vice-president, and Lewis Atherton, secretary of the Jackson Employers Association, secretary-treasurer. Committees were appointed as follows: Entertainment, C. C. Hart, L. Atherton and H. M. Johnson, of the Sparks-Withington Company; membership, H. M. Johnson, C. C. Hart and C. O. Meridith, Armour & Company; entertainment, D. G. Crawford, Hayes Wheel Company; E. M. Stove, Home Products Corporation, and A. B. Sinoneau, United Appliance Company.

EUROPEAN PORT RIVALRY

Rivalry between continental Europe's three leading ports continues to be keen and is being watched by trade and shipping concerns the world over. The following are the port statistics for the first four months of 1921:

	HAMBURG	
	Ships	Tonnage
1921	2,243	2,639,675
1920	1,312	960,142
Difference	+931	+1,679,782
	ANTWERP	
1921	2,492	2,423,161
1920	2,522	2,677,144
Difference	—93	+746,442
	ROTTERDAM	
1921	2,564	3,510,600
1920	1,096	1,444,272
Difference	+1,469	+2,066,328

From the above, it would appear that Rotterdam is slowly passing her rivals in number of ships and tonnage entered.

EUREKA-CROESUS STOCK BARRED

It was reported from Lansing, June 10, that the Michigan Securities Commission had disapproved application of the Eureka-Croesus Mining Company for permission to sell 1,300,000 shares of its stock of $1 par value. The same dispatch stated that the attorney general might start proceedings as a result of the advertising of the stock if it could be shown that the same was actually sold. H. N. Duff, executive officer of the commission, is quoted as stating that 900,000 shares are held in Michigan of which about 700,000 are in the pool organized by Eugene Davis, L. P. Barrett, the assistant state geologist, who made an examination of the properties, is quoted as saying that the statements made by President F. L. Torrey to the effect that there was much ore available without expense, is a falsehood and was made with attempt to deceive. Other excerpts from Mr. Barrett's statement are reported as follows:

"The management of the company is inefficient. The accounts are in such shape they can not be presented as evidence of the present financial status of the company. No accounts other than single entries or receipts of expenditures have been kept.

"The company officials have issued exaggerated and misleading statements to their stockholders. The best possible classification of the mining property is that of an extremely speculative prospect. Torres and Harris (superintendent of the mine) both admitted that the property was at its best only a prospect. Mr. Catlin's statement, made at the preliminary hearing before the Commission, that this property was a mine and on a paying basis, was admitted to me by Torres to be false."

Cleveland Cliffs Cuts Upper Peninsula Work

Due to present business conditions, the operations of the Cleveland Cliffs Iron Company in the Upper Peninsula, so far as mining, furnace and lumbering is concerned, were suspended a few days ago. According to the Munising News, between 1,200 and 1,400 men are out of work as a result. The newspaper has a statement made by President William G. Mather, which in part is as follows:

"The Cleveland Cliffs Company, despite unfavorable business prospects, has run its mines nearly full strength up to this time to avoid unemployment, particularly during the winter. It is, however, possible to continue but a short time longer at this rate.

"With 28,000,000 tons of ore on the lower lake docks and in consumers' yards, against 48,000,000 a year ago, and no sales thus far, and with our own stock piles nearly filled, there is no choice of policy. We must radically curtail production.

"What small stocking place remains should be conserved, so that, if possible, employment can be increased before the cold weather again sets in. This unavoidable reduction, while causing much hardship to employes, is, we realize with great regret, still worse for our employes, but it can be better borne in the summer than in the winter.

"I have been in consultation for the last three days on this matter with M. M. Duncan, vice-president and general manager, in charge of mining operations, and our superintendents, in order to see how the cutback will work the least damage upon our mines and hardship on our employes, and the curtailmenta have also been distributed with reference to prevention of entire idleness in any one community.

"Our conclusion is to abandon the Lake and Lake Angeline mines, which are practically exhausted, also the Meadow, the Iron Steamba range; to close, for the time being, the Cliffs Shaft, the Spies, on the Menominee range, and the Wade-Helmer and Crosly, on the Menaba range; to put on half time, as compared with present operations, the Holmes, Princeton, Morris-Lloyd, the Maas, Gwinn, Stephenson and

"The result amounts to reducing our product by 150,000 tons per month.

"Our furnace, chemical and lumbering departments are hit still harder than the mines. The Gladstone plant was closed on February 1 and the lumbering and furnace operations connected therewith, will be shut down this month, leaving this department entirely idle. The sawmills and woods operations in Munising have also been idle since the first of April.

"The company owns twelve large steamers and only three of them are in commission. Steel mills and blast furnaces with which we are connected in Cleveland and in Youngstown are running on only 25 to 50 per cent basis.

"It is the most sudden and severe depression that I recall in my business experience, and it is the aftermath of the feverish activities induced by the war; it prevails, however, all over the world.

"We have no choice but to try to adapt ourselves to these conditions. Our communities no here are rather small and somewhat isolated from large centers and we must all pull together during hard times."

Public Utilities

NEW PROJECT IN LANSING

The West Side Pine Lake Power & Light Company has been organized in Lansing for the purpose of getting light and power for west shore dwellers. E. E. Pauliy was given the contract to install a lighting unit.

M. O. EMPLOYES ORGANIZE

Employes of the municipal street railway lines in Detroit have organized a union and affiliated themselves with the international Association of Street and Electric Railway Employes, it is announced. The city charter, while not forbidding the organization of M. O. railway employes, does not recognize a union. It was said at the city hall that no action probably would be taken by the city for the present.

COMMUNITY POWER CO.

The Community Power Company, Hubbardston, is now in operation and Maple Rapids and Middleton are being furnished with power. Later the company will supply light and power for Carson City also.

LUDINGTON GAS DEFICIT $9,000

The Ludington Gas Company is facing a deficit of $9,000 for the current year, President C. N. Remington, of Grand Rapids, told the city commissioners last week. Mr. Remington petitioned for permission to impose a service charge of 50 cents a month, which would yield his company $6,000, he said. Ludington pays $1.52 per 1m gas. A committee will report shortly.

News of the A. I. B.

Following is a list of members of the Detroit chapter of the American Institute of Banking who have passed Prof. David Friday's examination in economics, money and banking, following the season's course of lectures:

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Organizing The Construction Industry

The International Chamber of Commerce Takes Lead in Forming World Body for Mutual Help

GAUGED by the number of persons employed, the construction industry is the largest of all the industries. In the United States approximately 11,000,000 persons are engaged in building activities of one kind or another. Measured by the money value of the yearly volume, the construction industry becomes the second largest, agriculture being the first. R. C. Marshall, jr., general manager of the Associated General Contractors of America, and formerly brigadier-general in charge of all cantonment construction in the United States, says that three-fifths of the proceeds of new financing and one-half of the country's annually accumulated capital are used for construction, reaching the enormous total of $77,000,000,000.

Gen. Marshall also is authority for the statement that, despite these facts, there is no organized building industry. No provision is made in the credit system of the country for construction as an industry. When he speaks of the construction industry Gen. Marshall means a definite group of activities concerned with the building of industrial, commercial, domestic, transportation and utility structures, railroads, highways, steamships, terminals, irrigation, sewers, drainage, mines and canals.

Some of the various branches of construction work are organized, but a construction industry as differentiated from manufacturing, agriculture and transportation does not exist as a distinct, unified enterprise. A result of this lack of organization, Mr. Marshall says, is the absence of any source of information regarding all those elements which enter into the successful operation of a construction industry.

On an International Basis

Through the International Chamber of Commerce a movement has been started to organize the construction industry upon an international basis, and in behalf of this movement Gen. Marshall and W. E. Dickinson, secretary of the American Committee on Organization, came to Detroit last week to interest builders, bankers and materials men in the plan to establish an international bureau of survey and statistical research. The original committee consisted of two representatives of each of these countries: Great Britain, Belgium, France, Italy and the United States. Gen. Marshall is chairman, and Frederick L. Cranford, president of Frederick L. Cranford, Inc., New York, is associate chairman.

Other members of the committee are the following well-known figures in the construction industry:

W. E. Wood, president, W. E. Wood Company, Detroit; Arthur Bent, Bent Brothers, Los Angeles, Cal.; J. W. Cowper, president, the John W. Cowper Company, Buffalo; J. H. Ellison, vice-president, Winston Brothers Company, Minneapolis, Minn.; Charles Folliott, president, A. Guthrie & Company, Inc., St. Paul; D. A. Garber, president, North-Eastern Construction Company, New York; A. P. Greensfelder, secretary, Fruin-Colnon Construction Company, St. Louis; H. B. Hanger, president, Mason & Hanger Construction Company, Richmond, Ky.; B. H. Hardaway, president, Hardaway Construction Company, Columbus, Ga.; Noble F. Hoggson, president, Hoggson Brothers, New York; George C. Mason, vice-president, Hurley-Mason Company, Portland Ore.; W. A. Rogers, president, Bates & Rogers Construction Company, Chicago; Sumner Sollitt, president, Sumner Sollitt Company, Chicago; Leonard C. Wason, president, Alberthaw Construction Company, Boston; George Watson Company, Dallas, Tex.; John R. Wiggins, president, John R. Wiggins Company, Inc., Philadelphia, Pa. and W. O. Winston, president, Winston Brothers Company, Minneapolis.

It was the opinion of the committee that the construction industry should have much the same type of organization and the same system of obtaining information that the bankers have, but before proceeding to the establishment of a bureau of research, the committee decided to send representatives to the principal cities in the United States to obtain approval of the plan.

In Detroit Gen. Marshall met a few of the builders and bankers in the Board of Commerce Friday afternoon, June 17, and outlined the plan to them. The meeting, of which John L. Lovett, manager of the Michigan Manufacturers' Association, was chairman, resulted in the appointment of this committee as a point of contract in Detroit: W. E. Wood, chairman; John J. Commerford; Frank G. Smith, vice-president, First and Old Detroit National Bank; T. W. Murray, United Fuel & Supply Company; J. A. Bryant, Bryant & Detwiler and C. W. Russel, Russel Wheel & Foundry Company.

Gen. Marshall said it was the war that brought sharply before the construction men of this country the need of some central, reliable source of information on the construction industry of the world. When the United States was in the market for materials of every description, government agencies were handicapped by a lack of information as to the sources of supply of materials, labor and trained men. It was necessary, he said, first to obtain this information. The work involved cost considerable valuable time and a great amount of money. A year ago a meeting was held at the International Chamber of Commerce in Paris and there it was decided to organize the construction industry on an international basis, at least so far as was necessary to provide a central bureau of information. The plan has been approved by Herbert Hoover, Secretary of Commerce.

When established the research and statistical bureau will prepare to furnish the following information to be obtained by a world survey:

Definite facts about raw materials necessary in construction, with schedule of price levels throughout the world;

Where raw materials are available;

What manufactured materials and machinery are available, and where;

Outline of demand for raw materials, manufactured supplies and machinery;

Report on character and amount of construction in progress in every country;

Kind and amount of labor needed, and where;

Where labor, skilled and unskilled, is plentiful; where scarce;

Distribution of beneficial discoveries and methods from one country to the rest of the construction world;

The distribution of new or better or more practical methods in building construction;

Complete data on transportation—where needed—where available;

How construction enterprises are financed throughout the world;

Complete review of credit conditions;

Import and export tariff data;

Facts on governmental control of construction, materials labor, transportation, credit and mass production methods;

Dumping possibilities;

Agencies and associations in the construction industry;

Technical schools and journals;

New market opportunities.

It's a Sizeable Task

The information thus compiled will be of special benefit to dealers in raw materials, manufacturers of materials, contractors and builders, engineers and architects, labor, management, exporters and importers, transportation officials, chambers of commerce, tariff officials, educators and publishers, firms having contracts in rebuilding devasted sections, and financial men.

It will take several years and a staff of highly skilled men to gather and organize all this information, but it will be handled in two general divisions, compilation of all existing data with the aid of existing agencies, and research in fields not covered by other agencies. Department groupings suggested are as follows:

Documentary—For the classification of all existing data and general information from known sources;

Digitized by Google

Reporting—For collection of information;

Research—For original research in all countries by field secretaries familiar with the language and customs of the peoples in the countries visited, whose work will be checked up by field directors;

Executive—For distribution of information under the direction of a director general in charge of all bureau departments.

Having this information at hand, the bureau will be able to tell the industry—

What competition to expect at home and abroad;

The possibilities for development of foreign markets;

How to judge whether a foreign offer is sound;

How to widen the export field;

What countries are in need of tools, machinery, motor cars, trucks, safety appliances, rails, pipe, hardware, paint and building materials;

Where there are opportunities to obtain construction contracts in other countries;

Where there are strikes, walkouts, profit-sharing, labor guilds and welfare work;

Where competition is keen and the nature of that competition;

How goods should be manufactured, packed, marked and shipped to different countries;

How chambers of commerce and boards of trade can extend their services to the construction field;

What tariff schedules exist, why and how they should be revised;

How to use the services of commercial attaches, and what they are supposed to do and how they do it;

Where financing is needed and is justified;

The effect of taxation on construction in all countries;

Needs of the Orient, Russia, China, India and South America;

What finances are available for this work;

How business should be conducted with foreigners;

Evidences of prosperity or depression throughout the world and in any one or several countries.

Mr. Smith's Talk

Following Gen. Marshall's outline of the plan, Frank G. Smith, of the First & Old Detroit National Bank, expressed his approval of the idea.

"I can see no reason why such a bureau should not be established and why it would not be of inestimable value to the industry," he said. "A short time ago a Detroit contractor told me that he would have had to give up a certain city contract had it not developed that he could buy certain material cheaper in Belgium than in the United States. How he obtained the information I do not know, but you can see that it meant considerable money to him."

"There are agencies at work gathering information," said Mr. Dickinson, "but the scope of their work is necessarily limited and they are not always satisfied with the results. For instance, the only source of information on labor is the American Federation of Labor, and much of this information is biased and therefore unreliable so far as the employers are concerned. Of all the major countries, the United States has the least general information on the construction industry. We have a chance to remedy this defect now, and with the understanding that every country subscribing to the service will share in the cost."

In a recent address in Washington, Mr. Cranford, associate chairman of the special committee, said:

"Speaking broadly, and not individually, our function is the construction of the economic facilities or plant of the people of the United States and our activity or inactivity is of national importance. At this minute progress in construction is stopped, maintenance of our industrial and economic plant is not being fully kept up, and such activity as we are engaged in is largely confined to urgent maintenance and repair.

"Transportation is the key to development. Transportation is originally construction and transportation in this country always has been the key to development. The building of the Erie canal opened the door to the development of the Middle West; the building of the Pacific railroads opened the door of opportunity west of the Mississippi. It is interesting that a very small investment, comparatively, $200,000,000 or $300,000,000, spread over a period of about 60 years, constructed the facilities which opened the greatest door of opportunity the world ever has seen, but every individual that entered that door faced the problem of construction, home building and the development of natural resources. Who of us would venture to measure the percentage of development we have now built within this territory?"

On the subject of wages, Mr. Cranford said in part:

"In the period before the war, labor, especially unskilled and semi-skilled, did not get a square deal; wages were inadequate properly to support families. The advance in wages during the war followed usual economic laws and was to be expected, but the further advance in the post-war period was unwise and seemed to have much the same basis as the boosting of real estate prices in a boom town. The question of wages is very important. Its solution is essential to our reconstruction. It is unfortunate that we must wait until the unemployment of millions of men forces wage reductions. I believe we should go at this problem with courage and fairness and not misuse the power we have. If we do not, otherwise unemployment for more millions will be the result."

Referring to the Lockwood investigation, Mr. Cranford said that the graft and price fixing combinations brought to light temporarily had destroyed public confidence. He added:

"During the last year in New York city, notwithstanding as large a degree of cooperation between builders and union labor as existed in any other community or any other industry, labor difficulties never were more frequent, from which an inference can be drawn. We are reminded of Sam Parks and his operations twenty odd years ago. They seemed to have had a continuing effect."

Mr. Cranford made no attempt to condone high costs of materials when he said:

"Construction materials at the peak of the high prices reached an advance of 300 per cent over the pre-war prices, and they still are double. The Lockwood committee has compelled the dissolution of several price fixing groups—that is, they destroyed the organization through which such price fixing was initiated, but what the result will be as to the substance remains to be seen. Personally, I believe in cooperation as the way out, but cooperation of the producers, or of the producers and labor, when in either instance the consumer is the victim of an economic crime, and it is used at this time to fleece those in actual need of homes. It is apparent that price fixing combinations have existed in some construction material groups, and it is safe to assume they operate all over the country. This situation needs drastic treatment."

Credit Facilities

His reference to the lack of a proper credit system in the construction industry as a unit shows where Mr. Cranford stands in regard to the need of some such facilities as the banking fraternity has. He says:

"A few months ago this organization sent Richard Waldo on a trip covering the greater part of the United States to survey the housing conditions. On his return Mr. Waldo reported an acute shortage of homes in practically every section of the country, which was due not only to the actual shortage of dwellings of every kind, but particularly to the demand for better housing by common labor. Mr. Waldo visited and talked with bankers everywhere, including the president of every Federal Reserve district. He asked each one what part of their credit facilities they would allocate to construction in the period of reconstruction then approaching. With one exception he received the same answer—that construction was an individual function and credit depended upon the individual standing of the applicant.

"The exception was the president of the Federal Reserve Bank of San Francisco, who said 'You have struck our weak spot. We have a nationally organized banking system, but no other industry is similarly organized; we have no information upon which would permit us to allocate credit to an industry, no matter how great the need.'"

Mr. Cranford in no wise seemed to be discouraged by the present conditions in the building industry. Instead he saw in it the growing nucleus of greater construction activities in the near future. He said:

"We believe that in the present industrial depression the construction industry is an important factor, because it is not only a preliminary factor to any new development or enterprise but because there is a vast delayed program to be performed. Ten years or more ago E. H. Harriman said the railroads were in need of an annual expenditure of two dollars a year for five years; that expenditure has not been made and it is probable that the need today is for even a greater amount.

"Hydro-electric development has been retarded due to the withdrawal of all public lands for entry for such use fourteen years ago. Public works and utility development were stopped upon our entering the war, and financial difficulties have prevented any considerable extension of them since. Reclamation and irrigation projects have been quiescent since 1914. Adding the delayed public works of our cities and states, of roads, terminal facilities, docks, warehouses, factories, home and business building, harbors and waterways, it is quite easy to figure a delayed construction program in the United States of $15,000,000,000. Very soon we will be embarked upon the greatest construction program this world has ever seen and with it will come general prosperity. First we must settle the questions of world peace and finance, but our present duty is to correct some other factors I have mentioned so that when the great questions are settled we will be prepared to do our share of the work ahead of us."

Compensation Act Applies To Out-of-State Cases

According to a decision handed down by the Michigan court, the workmen's compensation act of Michigan applies to all employment contracts made within the state, even when the accident occurs under such employment outside of the state. This problem has always confronted the industrial accident board and the McDonald law was passed by the 1921 legislature to give the board this jurisdiction. The court ruling now strengthens this position. The court declares that the legislature did not intend to limit the place of the accident, or it would have been so stated.

The court ruling was made in the case of Fidelia Crane vs. the Leonard, Crossette & Riley Company, Greenville. George W. Green, husband of the claimant, was in the employ of this company, which buys and ships produce. He had charge of three cars of potatoes consigned to St. Louis, Mo., and was found dying in one of the cars at Chicago, his injuries evidently being due to an accident.

In previous cases of this character the accident board has ruled that its power did not extend beyond the state, and has denied compensation. However, those cases were not appealed.

Bridge Financing Assured

Construction of Detroit-Windsor International Span Begins in 1922; Details of the Structure Made Public

By F. W. HERSEY

ASIDE from the willingness of Windsor to be a handy source of supply of bottled sunshine that brightens the arid communities on the American shore of Detroit river, the Border Cities and Detroit have many mutual interests that send approximately 12,000,000 persons and 600,000 vehicles back and forth between the communities every year. Even when Pontiac plotted the destruction of the tiny stockaded village that is now Detroit, and an Ojibwa maiden on the Canadian side frustrated the plot in ex pression of her love for a soldier, the broad expanse of water offered no obstacle to the birchbark transportation of the day.

It has been ordained from the first that the two divisions of one continent should be linked, first by a tunnel beneath the waters and then by a bridge over them. The tunnel was a long time coming, but it materialized in time. An international bridge, to be one of the engineering exhibits of modern civilization and a highway from shore to shore, has been dreamed of for many years, and within the last two years it has appeared a possibility hut not entirely a prohability. There have been objections to such a project. It has been declared prohibitive because of the expense. It has been frowned upon by certain transportation interests that have been ably serving the public with ferry boats, although with increasing difficulty because of the steady growth of Detroit and the multiplication of American and Canadian interests. At not time, however, has the engineering phase of the project been in doubt.

Judging from the announcement of Charles Evan Fowler, chief engineer of this project, to the effect that all preliminary work has been completed and that the details of design, rights and way and construction would be taken up at once, the international bridge connecting Detroit and the Border Cities will be in existence by 1926. After making the announcement Mr. Fowler left for New York to work upon the plans and specifications. On his return to Detroit, August 1, the work on the bridge approaches will be started, although it may be late in the fall before an appreciable number of men are put to work. From the time the excavation job is started to the date of formal opening will be four years, Mr. Fowler estimates. He is assuming that weather conditions, labor and material supply and other requirements will be normal enough to offer no serious handicap to the work.

This is the first definite statement that the bridge was to be built Mr. Fowler has been able to make during the two years he has been at work on the project. From the start he has been confident that he could build the bridge, that it would be financed and that it would justify many times over the cost of the undertaking, but the problem of financing such a project when the country was passing rapidliy from extreme prosperity to marked depression was such as to prompt great care in making public announcements.

Although the transition from stagnation to normal activities is progressing slowly, Mr. Fowler declares with all confidence that the financing of the bridge will be accomplished without any great difficulty. Apparently he has good reasons for his statement. His two years of work has been devoted to surveying traffic volume, deciding upon the type of bridge needed and its construction, and sounding the depths of sources from which the funds must come.

The details of the bridge project fall into three main divisions—finance, engineering and traffic volume from which revenue must be derived. Taking up the first subject, engineering, these details are given.

Drawing showing Detroit-Windsor international suspension bridge as it will appear when completed in 1926. This span, it is said, will be the longest and heaviest bridge in the world.

The bridge will be of the suspension type, closely resembling the Williamsburg bridge, New York. It will span the river at a point where the channel is narrowest, and will be 1,805 feet long, 110 feet above the water at the highest point in the span, and will be, according to Mr. Fowler, the longest and heaviest bridge in the world.

The towers from which the supporting cables will be strung will be 150 feet higher than the First National Bank building, or approximately 400 feet high. Eight cables, consisting of 10,000 wires each and capable of sustaining a strain of 240,000 pounds to the square inch, will be strung, one wire at a time, until the eight cables are completed, and wound with additional wire. In other words, there will be 6,000 miles of cable and 60,000 miles of wire, quite enough to tie a double hitch around the world. Besides the cables, the bridge structure will require 80,000 tons of steel, many tons of concrete and other materials. The wire will be furnished by the Roebling Company, which concern supplied the cabies for the suspension bridges over the East river.

The bridge foundations will be sunk to bed rock to a depth of 100 feet by the pneumatic process, this work to be done by the bridge company. When completed, the weight capacity of the bridge will be 24,000 tons per lineal foot, sufficient to stand the pounding weight of 80,000,000 persons crossing annually and 6,000,000 automobiles, to say nothing of railroad trains and trolley cars. The importance of the cables may be judged from that fact that their construction will occupy at least eight months.

Although two decks are to be built, the first one to be completed will be the highway deck, which will have two roadways, each twenty-eight feet wide, and two sidewalks, seven feet wide, both paved with concrete. Double trolley tracks will be laid through the center of the deck. At each end of the span there will be a three story fireproof building for bridge, customs and immigration offices, and two toll stations. Very probably the railroad deck will not be constructed for two or three years after the highway deck has been completed and opened for traffic. The approaches to the highway deck will extend half a mile inland on each shore, the grade being 4 per cent. The railroad approaches will extend inland a mile and have one and one-half per cent grade.

The location of these approaches is not announced, for the reason that certain rights-of-way must be obtained. However, it is fairly certain that they will be located well away from the present business center of the city, and therefore it may be assumed that the completion of this bridge will establish in Detroit and on the Canadian shore new business centers.

It would be futile for any company to plan such a project without having some assurance that the increase in traffic would warrant such an investment. Mr. Fowler says in this respect that within one year after the bridge has been opened the automobile traffic will have increased six-fold and the foot and trolley traffic two-fold. He estimates that the gross earnings for the first year will be 10 per cent on the cost of construction, with a steady increase in percentage thereafter. The tolls have been arranged as follows:

Foot passengers, 5 cents.
Street car passengers, 2½ cents.
Motor cars with two passengers, 30 cents.
Each additional passenger, 5 cents.
Trucks with load up to two tons, 50 cents.
Each additional ton, 25 cents.
Freight cars, $2.50.

These are tentative estimates. Undoubtedly some kind of commutation service will be provided, but it is unlikely that the minimum charge will go below 2½ cents, Mr. Fowler says. Street car service plans are to be worked out, but the desire is that alternate service by Detroit and Border Cities cars be provided with transfer privileges in each city.

The railway deck plans call for four tracks connected on the Canadian side with the Essex Terminal Railway to provide access for the Grand Trunk, Pere Marquette and Canadian Pacific. On the American side connections with all railroads entering the city are contemplated.

For railroad traffic it is proposed that 120-ton electric locomotives be used, power to be furnished by the hydro-electric interests in Canada from the new Niagara plant. The locomotives will haul from thirty to fifty cars, which, Mr. Fowler says, adequately provides for future

Motor Sales Have Picked Up, But–

Distributors Are Wary About Making Predictions; Not Much Chance for Improved Export Trade Soon

Detroit Dealers Declare Business Is Satisfactory

By MARC BRAUN

MUCH has been said and probably will continue to be said and printed on the subject of present, war time and pre-war prices, not only of automobiles but of practically everything else. Dodge Brothers, Detroit, in this connection have issued a series of charts showing the relation of price increases on their cars during the last six years to increases made in other lines. Two of the charts are reproduced on this page.

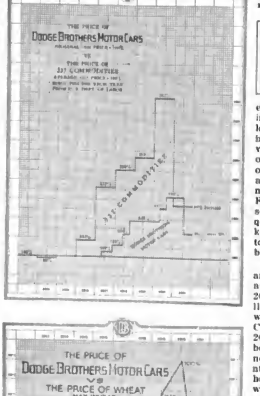
The commodity figures shown on the charts are those compiled by the United States Department of Labor and in most all instances are those prevailing in April each year, the basis for the price of the Dodge car being the original 1914 figure and the basis of the other commodities being based on the April figures since 1913.

Officials of the Dodge Brothers concern have not departed from their established policy of "saying the least and doing the most," in other words, they are still as reluctant as ever about telling just what is going on at the big plant. A visit a few days ago to the second largest automobile manufacturing establishment in Detroit revealed, however, certain facts which did not require a spokesman. Contrary to reports which have been circulated for some time the Dodge factory is in operation on what might be called a very nearly normal basis. There are thousands of men at work and between 400 and 450 cars are being produced daily. It is quite likely that this quota will be increased—all depending upon how business comes in. Just now there are orders galore on the books and Dodge dealers from most everywhere are calling for more cars. As is the case with other plants, as much, if not more, is being accomplished with a smaller force than a year ago. There is greater efficiency, more willingness to do well, greater care; the man know that there are many unemployed waiting for a chance to get in.

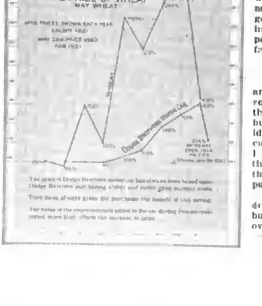
Outlook Improves

Asked as to the future, one of the executives of the company, who explained that the rule of the house is that he cannot be quoted, said:

"Just now the outlook is good. It may last 30 or 60 or 90 days. Nobody knows and nobody can tell what may happen. Business has met with so many unexpected reverses during the last twelve months that it has scared the prophets out. There are so many contributing factors which were not on the list either in 1914 or during the war days that it is extremely difficult to predict anything. There are certain principles which business men, whether manufacturers, merchants or shopkeepers, must follow, the most important being that we must be very cautious. Even if business does pick up all of a sudden, we must not come to the conclusion that it is going to stay that way. We have had several starts at better times but every time a sudden and unexpected slump has followed."



Inquiry made at the offices of the Ford Motor Company showed that the production schedule of 4,000 cars a day for June was being maintained steadily.



"We are turning out that average every day," said one official. "Some days we go up to 4,100 and even near 4,200, then again we drop down to just over 4,000. Orders have been coming in satisfactorily and naturally the recent price reduction has not caused a slump in the demand, in fact we have an accumulation of unfilled orders which, compared with normal times, is indicative of the fact that Ford cars are still in great demand."

What are the Detroit automobile dealers and distributors doing and what have they to say? Here is, briefly, what some of them told the writer:

Detroit Oakland Company—"We are doing well and feel quite confident that business will continue good. May was one of the best months we ever had. There seems to be no

(*Continued on Page 31*)

L. J. Ollier Writes Braun As to Conditions in Europe

[Several letters have been received of late by Marc Braun, of the editorial staff of this publication, from friends, automobile distributors in France and Belgium. In order to find whether some of the statements made in these letters were true, Mr. Braun wrote to L. J. Ollier, vice-president of the Studebaker Corporation, Detroit and South Bend, who has just returned from a trip abroad. It will be noticed in Mr. Ollier's reply, printed below, that he confirms most of the allegations.

In connection with the letter of Mr. Ollier, and for the enlightenment of the reader, it may be said that the limit price for automobiles in France—20,000 francs—and in Belgium—30,000 francs—is equal at present exchange rates to approximately $1,600 and $2,400 respectively. The price of the Citroen car in France—12,000 francs—is equal to about $1,625 in American money.—The Editor.]

I HAVE your letter of June 11 in which you ask me to give you the impressions I gained on my recent investigation of conditions in the automobile industry in Europe, and the outlook for American car sales.

I quite agree with the opinion expressed that the opportunities for business in Belgium and France are the general outlook for American cars is a bright, as has been stated in articles which I have noticed in various newspapers. In the first place, the value of the franc is a big factor in limiting the sale of cars in both of these countries. To this must also be added the duty of 45 per cent which now is effective on motor cars shipped into France, and a duty of some 25 per cent on some cars shipped into Belgium. I am not quite certain as to the Belgian duty but I know that it has just recently been brought up to a much higher figure than has prevailed before.

I talked with a number of dealers in France and they stated very positively that few if any motor cars could be sold for more than 20,000 francs. In fact, that seemed to be the limit in price which users of motor cars were willing to pay. When you consider that the Citroen is being offered for from 13,000 to 20,0000 francs, depending upon the type of body, and that recently the Renault have announced a 10 h. p. car which is being offered at a very low price—to say nothing of a number of other cheap cars of French manufacture which are being offered on the different markets, all of which is supplemented by the general preference of the French buyer to home products—there is left little or no opportunity, in my opinion, for American manufacturers to develop much business in France.

Economic Conditions Bad

The general economic conditions are bad and at this time the number of new cars being sold in France is very limited. In fact, until the Citroen people worked out a plan for building taxicabs their plant was practically idle, but I understand they have built up a considerable business in this line and when I visited their plant in Paris during March they were turning out about forty cars a day, the greater number of which were taxicabs or public conveyance jobs.

Under normal conditions there should be a decidedly active sale for motor cars in France but even for those cars which were taken over from our War Department and sold to

Cartage Program Formulated

National Team & Motor Truck Owners Association, In Convention Aboard Noronic, Discuss Problems

By ALFRED FISCHER

THAT the development of the commercial hauling industry has brought new problems, new necessities for regulation and greater opportunities for transportation service was the conclusion arrived at by the 200 delegates and visitors who attended the nineteenth annual convention of the National Team & Motor Truck Owners' Association and listened to the deliberations and discussions. The convention was held June 13-16 on board the steamer Noronic, starting from Detroit and cruising through Lake Huron and Georgian Bay, with stops at Mackinac, Owen Sound, Ont., Sarnia and Port Huron.

For four days the delegates discussed such questions as the relative efficiency and economy of horse drawn and motor vehicles on different classes of hauling; operation costs and the factors thereof; abuses in the sale of equipment; cargo insurance; legislation and general conditions. The spirit of the discussions appeared to be toward correcting conditions in need of improvement, wherever they existed, without recourse to regulatory bodies, and for the general stabilizing of the industry. The following were chosen for the ensuing year: President, Joseph X. Galvin, Chicago; first vice-president, E. Foster Moreton, Detroit; second vice-president, Joseph Glenn, Buffalo; secretary, F. L. Henk, Detroit; treasurer, William J. McDevitt, St. Louis; directors, for two years, E. H. Sullivan, New York; A. T. Barton, Kansas City; George Reichle, Cincinnati; D. J. Devine, Philadelphia; J. T. Counsell, Chicago; W. C. Wheelock, Cleveland; M. T. Green, Buffalo; Frank A. Britten, St. Louis; Carlisle Cameron, Minneapolis; directors for one year, to fill a vacancy, H. G. Beebe, Jackson, Mich. Time and dates for the 1922 convention were left to the decision of the new officers.

The convention was formally opened on the evening of June 16 by addresses of welcome from E. Foster Moreton, president of the Detroit Transportation Association, host for this year. Major Roiph Duff, Lansing, representing Governor Groesbeck, welcomed the delegates to Michigan, and John Atkinson, of the Department of Public works, represented Mayor Couzens on behalf of Detroit. F. J. Abel, Buffalo, speaking for the association as its president, responded.

The first discussion on elements in the industry came Tuesday morning when Wayne Dinsmore, secretary of the Horse Association of America, spoke on the subject, "The Horse, a Short Haul Money Maker," which was reviewed in these columns in part last week. He said further:

"The 1921 census figures show that there is an important revival in horse breeding and that the demand is steadily on the increase for good work horses. There are more horses on the farms today than there were ten years ago. The 1920 census showed 19,833,000 and last year the count was a little over 20,000,000, in the cities the decrease was about 900,000 horses.

"These figures would seem to indicate that, after having tried to operate with tractors the farmer has returned to his faithful servant, the horse, which will do all his work, while a tractor will perform only a part of the duties of a general nature."

Mr. Dinsmore said that three fifths of the horses which go into the hauling industry are raised in the Central West.

"I invite you motor truck operators to give serious thought to one phase of your work that is just developing," said Mr. Dinsmore, continuing his discussion. "There have been millions of dollars spent in highway construction in the United States. It has been demonstrated that a road suitable for passenger automobile traffic and light delivery work, as well as moving of farm products to makets, can be constructed for about $35,000 a mile. Such a type of highway, however, will not stand up under a motor truck load. The least that a heavy type road can be built for is $50,000 a mile. The extra burden must be levied against the taxpayers. The people of the United States are becoming very greatly interested in these figures. They are beginning to ask whether or not it is quite fair to build and maintain heavy roads free for the users and spread the cost on the taxpayers.

Delegates to the National Team & Motor Truck Owners' Association ninetsnth annual convention, and their ladies. This photograph was taken on board the steamship Noronic when it docked at Owen Sound, Ont. E. Foster Moreton, president of the Detroit Transportation Association, hosts of the convention, is standing on the stairway, in the center. Photo by Craig Studio, Owen Sound

JOSEPH X. GALVIN

Mr. Galvin, who lives in Chicago, is the new president of the National Team & Motor Truck Owners' Association.

"Another group becoming interested in that subject is made up of railroad operators. The trucking line that uses a highway paralleling a railroad right-of-way has free use of a route more expensive than the railroad, but which is built for him and for which he does not have to pay anything directly to use and maintain. It is becoming evident that as a result of this condition the motor trucking business is expanding rapidly at the expense of the railroads. In order to get along the latter are forced to increase rates. Then also, they are taxed to maintain these highways which make it possible for ruinous competition to exist against them. They are beginning to call for a more equitable condition of affairs.

"You are going to find a growing tendency to equalize the condition here described before very long, as the problem becomes better understood. Then when the railroads learn the nature of their competition they are going to lay out their city track systems so as to make hauls from team tracks as short as possible. It is a mistake to have a haul at any terminal more than two miles. Every city should have sufficient freight facilities to make that condition possible. Now, when that state of affairs is brought about, and the average haul in any large center is down to that distance, the horse is able to enter the lists as a serious competitor of the truck for carrying

Digitized by Google

that load such a moderate distance."

Development of cartage business has had the effect of creating several new varieties of insurance, the convention was told in two addresses by C. M. Carter, of the Detroit Insurance agency. Each new phase of risk brought with it a demand for protection, which, he said, was given where practicable and at costs commensurate with the risk involved. Except for protection against pilferage, said Mr. Carter, the trucking industry could protect itself against any kind of loss.

Mr. Carter described the newest branch of protection, fleet insurance, which gives a flat rate to operators of ten or more trucks or to owners of equipment representing an original investment of $15,000. In the event of no claims under this policy within certain periods of time, radical reductions are made.

The discussion which followed disclosed that there is a wide range in rates in various cities the tendency being toward higher rates on theft in larger cities. Mr. Carter cited figures showing that for some time past there have been four losses by theft as against one by fire. The rule of New York operators, limiting the amount of loss on shipments to a liability of $50, has compelled many shippers to protect themselves while their goods are in transit.

Joseph W. Glenn, Buffalo, in a paper on "Uniform Methods in the Cartage industry," emphasized the need of complete and adequate accounting, which would keep track of business transacted and costs. He reviewed a number of forms and showed exhibits taken from companies in his city. The informal discussion prompted by these displays indicated the necessity for standardization in cartage office practice.

R. W. Andrews, transportation cost specialist of the Packard Motor Car Company, Detroit, addressed the convention on "Motor Truck Costs." His remarks were based on compilations started during the war by the Council of National Defense and followed up by private concerns and other groups. The result of the findings, he said, showed the necessity of determining costs on the basis of the unit mile.

The unit mile, or ton mile, works like this: If a truck travels on a round trip of twenty miles and carries seven tons and returns light, the cost would have to be figured on a 70-mile basis. But if four tons of freight were carried back, thereby making eleven tons carried, the basis would be 110 miles. The ton mile basis must be figured to determine cost of handling for each commodity, as there is a wide range in expense of handling of the hundreds of commodities which come to the cartage man daily, Mr. Andrews said. The units entering into a cost table include fixed charges, such as interest, insurance, license, driver's wage and garage.

Variable charges per mile include such items as fuel, lubricants, maintenance, tires and sinking fund (based on 100,000 miles as the life of a truck). The third important item is overhead, which covers office administration, clerical assistance, postage, advertising, claims, etc. These things, with exception of overhead, have been worked out in what is known as the national truck cost system, and can be obtained wherever motor trucks are sold.

The address brought out a number of discussion which revealed the necessity for greater education along cost lines. Many speakers defended the established practice of basing costs on the hour basis. This was attacked as having too many loopholes for dishonest practice, overloading, over-speeding and other expensive factors. All were unanimous that the industry should lose no time in establishing its cost based on actual operation in the various sections of the country for all classes of hauling and every kind of equipment.

Organization Matters

The vast amount of organization work that the convention was called upon to handle was indicative of the year's development in the Association. Delegates from the several cities were urged to work for permanent offices with full time secretaries for their respective locals, in order that the membership might get better service in protection against forces that might be detrimental to their business, and for the development of new varieties of service. Wherever the plan has been tried, it was shown, a healthier condition and greater stabilization was the result.

The constitution was amended to permit other groups of commercial haulers into membership, such as state bodies. This makes it possible to take the Michigan Highway Transportation Association into membership. That body was organized in Grand Rapids in April of this year, and is desirous of becoming affiliated. The election of Mr. Beebe as a director was to make that induction easy.

The other and more important action for the constitutional amendment was in order that the other large national body, the National Association of Commercial Haulers, might find a way to merge, a movement that has been talked for some time. President W. A. Sted, Cleveland, head of this association, which is just about a year old, attended this convention for the purpose of opening negotiations with a merger in mind. It is the intention of Mr. Galvin, of the older group, to attend the Commercial Haulers' convention, which comes at Milwaukee this month, as a return courtesy and to get the opinion of the new body on this question.

Demands from several large cities for local cartage associations revealed the necessity for much organization work during the ensuing year, and to make that possible the convention voted to increase its per capita tax. A special subscription was also voted again all members for the association official organ, the National Team and Truck Bulletin.

In the resolutions adopted by the convention, store door delivery plans were held undesirable. Isaac Goldberg, New York, in tendering the resolution opposing this idea, called it a scheme to sell equipment to railroads. The plan, which is an outgrowth of the war, would provide for having railroads do their own terminal carting. Mr. Goldberg pointed out that many roads were unfavorable, since it placed upon them a responsibility for the safety of merchandise after it had left their premises.

Another resolution by George Wilson, Detroit, criticized the government of that city for its methods in hiring trucks and insisting on cut rates and overloads in the handling of municipal work on street railways and other improvements.

Detroit continues as national headquarters, with offices in the Detroit Transportation Association building, at Third avenue and Howard street.

The Society Salesman

[The following, which appears concurrently in Hyatt's Tractor Tract, published by the Hyatt Roller Bearing Company, has to do with the merchandising of farm tractors, but it is not without application to other lines of salesmanship, especially in these times.—The Editor.]

A SALESMAN traveled many miles from his home office to call on a farmer. He *offered* to sell this farmer a farm tractor. The farmer was not inclined to accept favors on such short acquaintance and politely declined.

He said he didn't need a tractor.

The salesman goes back to town, gets a room at the hotel—a nice room equipped with a shower bath. He visits the food emporium and eats a $2 steak with the conventional accessories. Then, being in an imaginative mood, he makes out his expense account and goes to a movie drama.

Later he returns to the hotel and writes a report on the call. It is an exhaustive report, embellished with superlatives, complete even to the most minute detail.

He tells how through some stroke of luck he succeeded in getting an unusually satisfactory interview with this particular farmer. Found that they had mutual acquaintances—in fact a slight family connection on his Uncle's side!—need to know a chap at college who courted the farmer's daughter! On the strength of all this the whole family gave him a cordial reception —he even made friends with the dog—would just naturally have to admit that he got under the old man's skin.

Incidentally would have sold him a tractor except that he said *he didn't need one.*

And the salesman, having thus finished his two-hour report on his five-minute call, lovingly fondles the missive, puts it in an envelope, hids it God-speed and entrusts it to the care of our Great Postal System, where it went through the usual period of hibernation and was ultimately delivered to the Sales Manager, somewhat yellowed with age.

And the Sales Manager read it. He re-read it. He slept over it and he answered thusly:

"My dear Mr. Salesman:

"Although your report is above reproach from a rhetorical point of view, unfortunately we have no 'society column' in our correspondence file.

"Right now I don't remember whether it was Moses or Elbert Hubbard who said: 'Friendship founded on business is better than business founded on friendship.'

"The man who shines in society is usually dull in business, so let's put business at the top of the list—first, last and always.

"You say that this farmer doesn't need a tractor. Now let me tip you off to *some real inside dope: That's exactly why you were sent to see him!*

"Few farmers know that they need tractors. Why man alive! if they *did* know it Sears-Roebuck and the Baltimore Bargain House would have monopolized the industry years ago!

"In his own opinion a man never needs a thing with which he is not familiar. Folks didn't need electricity until Tom Edison came along and put the bee in their bonnet!

"If the farmer realized the need of tractors we wouldn't have to spend good money for advertising. If he had learned all the advantages of power farming you and I both would be out in the shop helping production to catch up with sales or else we'd be trying to sell 'em something that they *didn't* know they needed!

"The kind of farmers that we are anxious to sell are pretty shrewd business men. Naturally they assume the offensive. Nine out of ten will tell you that they don't need tractors. The tenth one will buy anyway—no use spending much time with *him!*

"Some of these farmers will tell you they don't need a tractor just to hear the advantages reiterated again. It's music in their ears. Don't disappoint them—throw in your clutch and let 'em have the whole story—let 'em have it on high gear!—once, twice, three times if necessary."

"I'm afraid this particular farmer is a better

The Machine Tool Outlook

What Does Michigan Sales Field Offer for Future And What New Sales Policies Therefore Must Prevail?

—Donahey in Cleveland Plain Dealer.
BETTER KEEP YOUR EYE ON "JERRY!"

—McCutcheon in Chicago Tribune.
ECONOMIC HISTORY OF THE U. S. DURING THE LAST TWO YEARS

—Racey in Montreal Star.
TO WIN THE PEACE

WITHIN the last year the volume of machine tool business among the automotive manufacturers in Michigan has declined, one might say, from bucketfuls to thimble measures. Prospecting for orders among the numerous car and truck plants and their allied industries is just exactly what the first word in this sentence means—prospecting. Order taking has had its day and selling is the new order of business; but before much selling can be done considerable prospecting has to be done. A review of war time expansion in both plant space and equipment throughout the state offers little for optimism to feed upon, unless the prospector looks beyond the immediate evidences.

It has been said that many of the plants in this state are expanded and equipped for future business needs for a period of five years, assuming that we do not have another feverish demand for products such as characterized the last three or four years. Such a demand is not expected, consequently manufacturers are becoming convinced that the growth of business will be very gradual and the need for equipment moderate.

Service the Watchword

If this is to be the case, then the business of the next year or more will be "pickings," not "showerings." Where, for instance, machine tools, such as turret lathes, drill presses and other bulky machines were sold in "flocks," in the future they are more likely to be sold one at a time, here and there. It is apparent that the field will have to be canvassed thoroughly and carefully. It is certain that wherever a machine is sold the demand will be for every element of service the manufacturer can give.

The demand to "deliver whatever you have that can be used on this job" now changes to "look over my problem first and then provide me with what I need to do this work the best and at the lowest cost. If you can't fit my problem four-square, I'll have to look elsewhere."

The railroad business gave the machine tool industry its greatest incentive to development until the automotive industry increased the range of possibility and demanded more specialization. As a result, specialization was carried on with a high hand and at a great cost. Competition in quantity output among the automobile plants in Michigan put factory production engineers on their toes and their leaning was toward special machinery which would make possible rapid production by the simplest operations. Tools for these machines were made in the plant tool rooms at great expense because this kind of work requires much skill both in designing and in workmanship. The expense of specialized machinery and tool production has been much greater than has been realized. It has not been necessary to consider this expense in the same questioning light that it will be considered hereafter.

The rapid production required has taken its toll from the life of much of the machinery installed, and it is not unreasonable to suspect that with a resumption of industrial activity, replacements will be necessary before the maximum efficiency can be obtained. For a while at least it is to replacements that the machine tool business must look for its new orders. Manufacturers of long standing in the machine tool business seem to be of the opinion that there will be less specialization in machinery desired if standard machines can be made to do the same work at less initial cost. The stress of modern manufacturing methods wears out machines, and where such machinery is custom-built the cost of replacements is a heavy item.

With economy uppermost in his mind it is probable that the manufacturer will modify somewhat his idea of specialized machinery if he can adapt standard machines to his work. He will be encouraged by the machine tool manufacturers, who, undoubtedly, will make the standard machine fit the job. To accomplish this the machine tool man will have to give more time to the study of manufacturing problems, which is service. Service has not been such an important factor in any business during the last few years, for the reason that the sellers' market changed business psychology on the one hand, while on the other, the demand for products came from so many sources and in such volume that the problem of adequate supply occupied the whole attention.

Mr. Stillwell's Opinion

C. S. Stillwell, Detroit district manager for the Warner & Swasey Company, Cleveland, reflects the mental attitude of industrial buyers and also the new viewpoint of the sellers of industrial equipment, when he says:

"For the next few years we in this business will be devoting as much if not more attention to the sale of one machine than was required to sell a battery of them a year ago. In this state alone the sale of machine tools has been twice as great as it would have been normally, and if we can sell 50 per cent as much product in the next year or two we will be doing 25 per cent more business than was done five or six years ago. The buyer will demand every element of service the seller can give him.

"I do not share the opinion of some whom believe it will take five years for the industry of this state to get back to capacity production. But I do admit that the process must be gradual; that less product will be sold, with a greater expenditure of effort. My experience with the automobile industry is that it is quicker on the trigger than any other enterprise. As an illustration: The other day I was working on a program for a certain plant in this city, and I was given what seemed to be a definite answer to the effect that the program could not go through. A few hours later I received a message that the program would go through and it was up to me to get busy.

"Two important elements that will help dig out business are consistent advertising and

Chemical Engineers Hold Convention in Detroit

The American Institute of Chemical Engineers held a six day convention in Detroit this week. Men prominent not only in the chemical world, but in many other industries, institutions of learning, etc., took part in the meetings which brought to the city a galaxy of notable speakers.

Sessions were held in the convention hall of the Hotel Statler. On Monday the visitors were invited to inspect the Cadillac Motor Car Company's new plant. In the evening they were the guests of the Detroit Boat Club. On Tuesday they went to Ann Arbor, where they inspected the laboratory of the University of Michigan. The day's meeting was held at the University. Henry Ford's River Rouge plant was taken in on Wednesday forenoon and during the afternoon the chemists visited the plant of Hiram Walker & Sons, in Walkerville. The evening they spent "barbecuing" on the shore of Lake St. Clair. More boat riding was on the program for Thursday forenoon and that evening a subscription dinner was given at the Statler.

Between the boat rides and sightseeing and investigation trips the delegates met and heard among other well-known speakers the following: Dr. M. L. Burton, president of the University of Michigan; W. L. Badger, professor of chemical engineering, University of Michigan; Dr. C. D. Holley, director of research for the Acme White Lead & Color Works, Detroit; Chester M. Culver, Employers Association of Detroit; W. B. Stout, head of the Stout Engineering Laboratories; Col. A. E. White, director of the Department of Engineering Research, University of Michigan; A. H. Blanchard, professor of highway engineering and highway engineering and highway transport, University of Michigan; O. C. Berry, chief engineer, Wheeler-Schebler Carburetor Company; Henry M. Leland, president of the Lincoln Motor Company; David Wesson, oil expert; C. F. Kettring, chief of research of the General Motors Corporation; W. A. Gatward, engineer, Hopkins Manufacturing Company; William G. Nelson, chemist, Morgan & Wright; A. N. Corse, general manager of the Monel Metal Products Corporation; Dr. J. C. Olsen, president of the Brooklyn Polytechnic institute, and Dr. J. H. Ransom, chief of research of the Michigan Smelting & Refining Company.

Wives and daughters of the delegates were not forgotten, they were kept practically as busy sightseeing and being entertained as the men. They took in the Twentieth Century, Country, Barton Hills and Detroit Athletic Clubs on different days, visited the Ford Motor Company's plant in Highland Park and were given a boat ride and another outing in Palmer park.

FOR SAFER DETROIT STREETS

The police commissioner of Detroit has announced that renewed efforts will be put forth by the department to make the streets safer. The commissioner is said not to be satisfied with the showing made during the first half of June as to the number of fatal accidents, which totaled 52 as compared with 110 for the corresponding period in 1920.

According to the figures given out by the commissioner, there were in operation up to the end of last week in the city of Detroit 3,019 jitneys, 397 public vehicles, 284 taxis and 50 motor buses, a total of 3,784 vehicles used in carrying passengers. This is an impressive increase over the situation one year ago.

SCOTT BILL PASSES HOUSE

The Scott bill amending the LaFollette Seamen's Act, was passed late last week by the House of Representatives by a vote of nearly 2 to 1. Two or three slight changes in the revised draft, drawn at the recent Great Lakes conference at the Detroit Board of Commerce, were made

What Motorsts Are Looking For

"ENDURANCE is the most popular and economy the second favored feature of the motor car, according to a nation-wide poll of motorists," said J. C. Long, of the National Automobile Chamber of Commerce, speaking before the Associated Advertising Clubs of the World, in Atlanta, last week. "Comfort is the third consideration, followed by price. Speed and distinctive refinements have little interest for the average purchaser."

These conclusions are the compiled returns from question cards sent to car owners in all sections of the United States by the National Automobile Chamber of Commerce, asking motorists to express their relative preference concerning the following features of a car: Appearance (general), appointments, comfort, economy, indorsement of other owners, endurance, flexibility, hill climbing, price, service (good local repair shops), specifications and speed.

"Buying points," said Long, "rather than selling points are the important considerations today; and this poll of the customer should prove a helpful guide to both engineer and advertiser.

"Returns from twenty states, covering more than thirty makes of cars, on the index basis of 100 give the following emphasis to the different buying points: Endurance, 15; economy, 14; comfort 9½; price, 9½; appearance, 8; service, 7½; hill climbing, 7; flexibility, 6½; indorsement of others, 6½; specifications, 6; speed, 5½; appointments, 5.

"Twenty-three per cent of this poll expressed an interest in specially featured parts, such as motors and springs, but 48 per cent were not interested and 29 per cent were non-committal.

"Different makes of cars may call for different merchandising. The large farmer market, representing about 60 per cent of automobile sales, and the widening uses of the motor car in business doubtless will continue to accentuate ability to 'stand up,' economy of operation, easy riding qualities, and price in relation to value, as leading buying points."

Michigan Foundrymen Discuss Standardization

Means of effecting standard costs for foundry work, whether done in large or small foundries, and plans for co-operating with the facilities offered for experimental departmental work by the engineering department of the University of Michigan, were the chief topics before the first regular meeting of the newly organized Michigan Foundrymen's association, in Muskegon, last week.

The meeting was attended by 25 foundrymen from various parts of the state. Samuel Powell, secretary of the Ohio State Foundrymen's Association, addressed the meeting on standardization. He also gave the newly organized association the benefit of some of his experiences in general conduct of the association's business.

Prof. A. E. White, of the University of Michigan, spoke on the possibility of the manufacturers using the facilities offered at the University for carrying out experimental work. He asked that the foundrymen make full use of these facilities.

The address of welcome was delivered by A. M. Larsen, president of the Muskegon Employer's association.

Two committees, one named to prepare a contract form for use in doing business with coal dealers and the other to submit contract forms for use in buying pig iron, reported their suggestions. The forms presented were discussed considerably and the committees asked to give further consideration to them and to report again at the next meeting.

The session continued until late in the afternoon, after which the visitors inspected the new Shaw Crane foundry building and other plants in the city and Muskegon Heights.

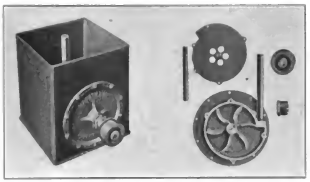
President J. Edgar Lee, of the Challenge Machinery Company, Grand Haven, presided, while H. W. Lorz, of the Lansing Foundry Company, acted as secretary. The next meeting will be held at Manistee.

RECEPTION TO NEW CITIZENS

The Detroit Board of Commerce will give a reception Sunday afternoon, June 26, to 600 foreign born citizens who have been naturalized during the last month in the federal and circuit courts. Judge Arthur J. Tuttle of the United States district court, and Judge J. H. Goff, of the Wayne circuit court, will present the certificates of naturalization, while aliken American flags will be presented the 600 new citizens by the Detroit chapter of the Sons of the American Revolution. Addresses will be delivered by the two judges and by John A. Russell, president of the Board of Commerce; Rev. Hugh Jack; Frank Cody, superintendent of schools; Rev. Minot C. Morgan and Aldrich Baxter. Boy Scouts and the Studebaker band also will participate in the exercises. Frank C. Sibley is chairman of the arrangements committee.

TOWNSEND BILL A LAW BY JULY 1

Senator Charles E. Townsend, Michigan, expects to get his highway bill passed by Congress before July 1, the date of the termination of federal aid to states in road construction. The bill, which creates a federal highway commission and provides for the construction of interstate highways under federal supervision, has been widely indorsed. One of the chief claims made for it is that it establishes a unified system of roads and does away with pork barrel legislation.



CADILLAC PROMOTES HULGRAVE

D. F. Hulgrave has been appointed manager of purchases for the Cadillac Motor Car Company, in Detroit. He succeeds J. H. Main, who has just been appointed director of the purchase section of the advisory board for the General Motors Corporation, with his office in Detroit. Mr. Hulgrave has served thirteen years with Cadillac, the last three years being as assistant to Mr. Main.

LAFAYETTE Soluble Oil Pump And Agitator,--

A Supply Tank With Built-In Pump and Agitator

Simple—Efficient—Durable

Pump is always charged with its cutting fluid, making loss of prime impossible.

It is self lubricating, all parts running in oil.

Wear does not affect pumping capacity.

No check valves to cause trouble.

Requires little power.

No springs.

Pumps oils and other fluids with equal efficiency.

Agitation important, as it prevents soluble oil and water from separating.

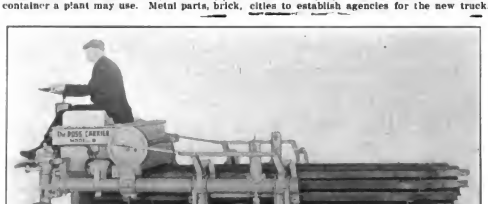
New Ross Carrier Perfected

H. B. ROSS, Benton Harbor, who has spent a lifetime inventing labor saving and time saving machinery for lumber mills, and who several years ago perfected a new type of industrial truck for moving a great quantity of lumber at a load, has redesigned this truck for use in industrial plants of all kinds. The first carrier developed proved so successful that a plant was established about five years ago and more than 100 of these carriers are now in use.



The original truck sold widely in southern lumber territory where mules and improvised platform trucks called "dollies" were extensively used. One of the Ross carriers displaced six to eight mules and as many dollies and drivers and also cut down the loading and transportation time below what was possible with animal-drawn trucks.

The new Ross carrier has a capacity of 4,000 pounds, is nine feet long, four feet, eight inches wide, turns in a radius of eight feet, four inches and has a clearance of thirty inches and a speed of six miles an hour. The depth of long material that can be carried is two feet, the length of loading platforms, six feet, six inches, and the width of load, three feet, two and a half inches. It is equipped with an Edison 24-cell battery, a 24-volt General Electric motor, solid rubber tires and will lift a load four inches in six seconds. The weight, including the batteries, is 3,000 pounds.

This type of carrier differs from other industrial trucks in that the truck straddles the load and lifts it. Platforms can be constructed of tough lumber and distributed about the plant. These platforms can be loaded at any time and left for the regular trips of the carrier. It engages the platform by means of wide flanges which slide under the edge of the platform, and the operator can then raise the load clear of the floor.

The platforms may be made in the form of boxes, baskets, hoppers or any other type of container a plant may use. Metal parts, brick, sand, castings, boxed merchandise, barrels, machinery, rails, angle irons in fact all kinds of building material and almost any bulk stuff found in manufacturing establishments can be handled. The length of material that can be carried is limited only by the space allowed for turning.

During the lull in business, which affected the Ross plant as it did other concerns, Mr. Ross perfected his latest carrier and production will be started as soon as business warrants. Samuel H Clark, assistant treasurer of the Ross Carrier Company, left this week for Eastern cities to establish agencies for the new truck.

DURANT TO HAVE FOUR COMPANIES

An order issued by the Michigan Securities Commission last week reveals that Durant Motors, Inc., is to have four distinct companies. The Delaware and New York corporations have been organized and approved but the proposed Michigan and California organizations have not been created. The Delaware company is to be the holding concern; the New York company will manufacture the cars for the territory east of the Allegheny mountains; the California concern for the territory west of the Rockies, Pacific coast and Mexico, and the Michigan company, with its plant in Lansing, for all the territory between.

The order issued by the Commission is satisfactory to the corporation. It is pointed out that only stock in the Delaware holding company is being sold at present, while the stock for the Michigan company will not appear until it is incorporated. The holding company controls at least 60 per cent of the stock in the other corporations.

G. N. Murchey & Company, Lansing Durant representatives, deny that any original Durant stockholders are now unloading at a profit. This, they explain, would be impossible. When W. C. Durant first announced his plans he was given unsolicited money and in return alloted to the subscribers stock at $10 a share, none of which could be sold for two years and then only through himself.

FRANKLIN SALES GAIN 100 PER CENT

According to officials of the Franklin Automobile Company, Syracuse, N. Y., sales for the first six days of June exceeded the corresponding period in May by 100 per cent, this impetus following the cut in the price of the car, announced June 1. This latest reduction, together with the previous cut in September last, means that the price of the Franklin has been lowered from $4,750, according to model. Since February 10, the Franklin factory has been on a 100 per cent normal basis and has been turning out cars at the rate of 40 a day. Production for June will total 960 cars, indicative of the manner in which sales are crowding on the heels of production. It is interesting to note that on June 1, the Franklin Company had on hand orders for June delivery amounting to 82 per cent of the month's output.

MCOY JOINS REO

B. B. McCoy, formerly advertising manager of the Olds Motor Works, Lansing, and previous to that connection identified with the Oakland has been appointed advertising manager of the Reo Motor Car Company, Lansing. For the last year Mr. McCoy has been handling General Motors advertising in the British Isles, with headquarters in London.

MAXWELL-CHALMERS APPOINTMENTS

John J. Plath has been appointed director of sales of the Maxwell Motor Sales Corporation and E. W. Clark to the same position with the Chalmers Motor Car Corporation. Announcement is made by Arthur E. Barker, vice-president and general sales manager of the Maxwell Motor Corporation. General offices of Maxwell Chalmers have been moved from the Chalmers plant, in Jefferson avenue, to the Maxwell plant, in Oakland avenue.

JORDAN SALES FOR JUNE

The statement is forthcoming from the Jordan Motor Car Company, Cleveland, that the response to the price reduction announced some time ago has brought so many orders to the factory that on May 31 the June production schedule of 700 cars had been sold to the extent of 679 cars.

"We are entering a period of keen competition in selling," said President Edward S. Jordan, a few days ago. "The recent cuts in tires and automobiles are but the beginning of the fight for business in which service to the user will be the determining factor for ultimate success."

BUICK'S OUTLOOK

The Buick outlook continues to improve steadily, according to a statement issued by H. H. Bassett, president and general manager of the company. Mr. Bassett calls attention to the fact that, with the exception of three weeks at the first of the year when a complete inventory was being taken, the company has kept 11,000 men continuously employed. He adds that production will be constantly increased and the working force augmented, although for the present no new employes will be taken on, preference being given to men formerly with the company.

TO MAKE DURANT TRANSMISSIONS

Transmissions and steering gears for the various cars to be produced by Durant Motors, Inc., will be manufactured by T. W. Warner Company and the Warner Corporation, Muncie, Ind. The two corporations, which are headed by T. W. Warner are to be operated independently, it is announced, but will be affiliated with Durant Motors. Mr. Warner has resigned the presidency of the General Motors Muncie products division and will be a vice-president of the Durant organization.

FURTHER WHITE CURTAILMENT

The Cleveland Plain Dealer says that notices have been posted in the plant of the White Motor Company, Cleveland, announcing further curtailment in operations effective June 30. It is understood says the paper that about 1,800 employes will be laid off.

SELLING REYNOLDS TRUCKS

The Reynolds Truck Company which recently purchased the assets of the defunct Reynolds Motor Truck Company Mount Clemens is selling the manufactured trucks on hand and when automotive conditions are more nearly normal expects to resume the production of motor vehicles. Albert Schott is president of the new company which is capitalized at $70,000; Fred B. Schott is vice-president and L. F. Wolf secretary-treasurer.

WILL MAKE MOTOR BUSES

The Duplex Truck Company, Lansing, reports that business is improving. The plant is operating three days each week. The company is planning to develop the passenger motor bus business and has received orders for several vehicles from the South Bend-Elkhart Motor Bus Company.

SEIBERLING'S AFFAIRS ARRANGED

Under an agreement between Frank A. Seiberling, former president of the Goodyear Tire & Rubber Company, and his creditors, Mr. Seiberling's assets have been listed at $10,136,570 and his liabilities at $6,700,000. The assets will be transferred to the Prudential Securities & Realty Company, which has been organized to handle the property and protect Mr. Seiberling's equities. The assets are said to be local in character and to include $2,000,000 of Goodyear preferred stock.

Digitized by Google

FOUR TYPES OF DURANT CAR

Dispatches from New York are to the effect that Durant Motors will produce four types of cars. The one selling for the smallest price, it is reported, will be the Durant, which will be priced at less than $1,000. This car is said to have been O. K.d by the Durant engineers. The next car will be the Sheridan, which will be made in the six-cylinder model only, and the next will be the Collins, an eight, which will be produced in Detroit. The fourth car, details of which are not as yet available, will be built in a Durant factory in Flint.

REO PAYS REGULAR DIVIDEND

The Reo Motor Car Company, Lansing, has declared its regular quarterly dividend of two and a half per cent on the common stock, payable July 1 to stock of record June 15.

WINTON ON 30 PER CENT BASIS

The plant of the Winton Company, Cleveland, is being operated at about 30 per cent of capacity, according to a statement by Alexander Winton, president of the company, who says that orders are picking up.

HOBLITT HEADS AJAX SALES

Frederick M. Hoblitt, who has been president and treasurer of Quick Tire Service, Inc., has been appointed general manager of sales of the Ajax Rubber Company, New York, succeeding F. E. Dayton, who severs his connection with the company after ten years service, to enter the real estate field. His resignation is effective July 1.

HAND WITH MACK ORGANIZATION

E. D. Hand, formerly vice-president and sales manager of the J. C. Wilson Company, Detroit, has been added to the executive staff of the International Motor Company, New York, manufacturer of Mack trucks.

GOODYEAR ADDS TO FORCE

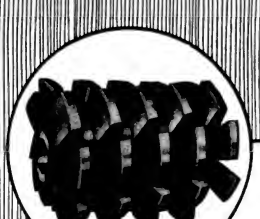
The Goodyear Tire & Rubber Company, Akron, has added 1,200 men to the working force and the daily production is said to be 16,000 tires. The tire business in Akron is reported to be running about 60 per cent of normal.

MOTOR WHEEL'S ORDERS

The Motor Wheel Corporation, Lansing, has several large orders on which it will begin work in the early fall. The plants are on a 50 to 60 per cent production basis.

HANDLEY-KNIGHT PRICE CUT

The Handley-Knight Company, Kalamazoo, which reduced its prices last November, announces a further reduction of $125 on its touring car, but no change on the other models.



Models	New Prices	Old Prices	Reduction
7-Passenger Touring	$2,850	$2,975	$125
Sedan	4,185	4,185	...
De Luxe	3,150	3,150	...

FISKE LEAVES FRIGIDAIRE

Co-incident with the merger of the Frigidaire Corporation with the Delco Light Company, Dayton, J. Parker Fiske has resigned as president and general manager of the Frigidaire. The latter's affairs hereafter will be under the direction of R. H. Grant, general manager of Delco.

ORR WILL ASSIST HANNUM

The appointment of Ernest M. Orr as assistant to George H. Hannum, general manager of the Oakland Motor Car Company, Pontiac, is announced. Mr. Orr, who has been associated with Mr. Hannum since 1906, has been plant manager of the Jacox Steering gear plant of the Saginaw Products Company. Both Oakland and Saginaw Products are General Motors subsidiaries.

PROMPT DELIVERIES

Prompt deliveries are being offered on Brown & Sharpe spur gear, worm wheel and special purpose Hobs.

Keep an eye on tne future. Check up your hob and cutter equipment. Be ready for all orders that require accuracy and speed--equip with

COMMERCIAL HAULING

BUSES ON GRAND BOULEVARD

The mayor of Detroit has recommended to the common council that the ordinance regulating the operation of motor buses on the streets be amended to give the council power to stipulate routes. The suggestion was drafted into proper form, last Tuesday evening, and given first and second readings. It will be brought up for third reading next Tuesday evening. The mayor's action was occasioned by the Detroit Motor Bus Company's starting operation of its buses on Grand Boulevard, between Grand River and Woodward avenues. The mayor is opposed to the buses on the boulevard.

FLINT'S NEW ORDINANCE

The Flint council has passed a new jitney bus ordinance designed to settle its recent dispute with operators of such vehicles. The new ordinance requires each driver to take out indemnity insurance and makes violation an issue for a court of chancery to determine. Only one dissenting vote was registered to the ordinance, which provides also that buses cannot run along city street car lines.

The ordinance provides that drivers must be 21 years old, able to read, write and converse in the English language, and must possess a full knowledge of all traffic laws, submitting to an examination to be conducted by the chief of police.

Routes and running hours must be stipulated upon application for license, which is made revokable. Buses must be properly lighted, have suitable winter tops for inclement weather and be equipped with adequate heaters. Five thousand dollar indemnity insurance to cover injuries to any persons who may be injured by the bus must be provided.

The ordinance, it is believed, will end a fight between jitney operators and the city, which started recently when the city attempted to stop the buses operating along street car lines. The buses operated with "free bus" signs, passengers having a privilege to "donate" their fares.

TOLEDO BUS REGULATION

Judge Johnson, of the Toledo common pleas court, has ruled that the city has a right to regulate the kind of traffic which shall use the streets, thus the jitney ordinance passed some time ago and which provides rules and regulations as to bus operation, will be enforced.

SERVICE OUT OF MANISTEE

Freight service by truck has been started between Manistee, Onekama, Bear Lake, Benzonia, Beulah, Elberta, Arcadia and Portage Point by Schlief Brothers, Menominee. The operation of the trucks is said to have been inaugurated upon the express recommendation of the business men of the towns and communities along the route.

SOME THINGS TO REMEMBER

L. B. West, president of the West Construction Company, Chattanooga, Tenn., recently advised the legislators of his state that when they considered the legislation limiting the weight of motor trucks they should take certain matters into account so that no injustice or undue hardship be the result to truck owners. Mr. West said:

"Recently my own company invested $50,000 in five-ton trucks and had no sooner put them in operation than state legislation was passed limiting the total weight of the truck and load to 7½ tons. It is a known fact that injury to the road is caused by the weight bearing upon each inch of tire in contact with the road surface.

"The only just and practicable basis of restriction is to provide a maximum weight per inch width of tire. The maximum weight adopted in a number of states is 800 pounds per inch width of tire. If a standard basis were adopted by all of the states, the truck manufacturer and truck user could proceed intelligently and without fear of having their product and equipment rendered almost useless by confusing and conflicting state laws.

"Traffic crosses and re-crosses state lines, and it is an absurdity for the owner of trucks operating legally in one state, to find, as soon as he has crossed the state line, that he is subject to heavy fines and even imprisonment for using the same trucks in the same manner on identically the same kind of roads as characterized the other state.

"Not only do such conditions work injustice to the truck manufacturer and the truck owner, but they are harmful to the taxpayer, for contractors cannot go in and compete in states where a large portion of their equipment may be barred from use, and where the contractors who actually bid upon work are restricted to equipment that may not be operated as economically as the heavier units. Truck weight regulation is desirable, but it should be based upon a fair and standardized conception of the justifiable limit in weight per inch width of tire."

TRYING OUT THE DUPLEX BUS

In order to try out a new motor bus it intends to manufacture, the Duplex Truck Company has started a jitney service in the city of Lansing, permission having been obtained from the council covering a period of thirty days. The chief purpose is to obtain figures on costs and possible profits for purchasers. The machine carries twenty-one passengers seated, with standing room for ten or twelve more. The car is of the pay-as-you-enter type, the entrance being at the front end. The latest patented fare registers have been installed and electric heating facilities provided. The fare is five cents.

MOTORIZING IN TOLEDO

The city council of Toledo has authorized the issuance of $125,000 of bonds, the proceeds to be used in motorizing the division of streets' equipment. It is planned to purchase six one ton trucks, four tractor dump trucks, thirty garbage collection trailers, four roadsters and one caterpillar type tractor. The tractor is to be used in road repairing and the ten trucks for alley cleaning, ash and refuse removal and to aid in carrying street repair materials. It has been estimated that there will be a saving to the city of $50,000 a year by using the motor operated vehicles.

DAVID BUICK HEADS LORRAINE

The Lorraine Motors Corporation, Grand Rapids, which formerly was the Hackett Motor Car Company, has passed into the hands of new interests, headed by David Buick, founder of the Buick Motor Company. Mr. Buick will be president of the concern, while A. H. Wyatt, Toledo, is vice-president and general manager. John L. Larkin, formerly with the Haynes Automobile Company, Kokomo, as sales promotion manager, will be sales manager. F. Van Voorst is assistant general manager.

A new car designed by Mr. Buick will be made and the first testing models are expected to be out within the next three months. The capacity of the plant is twenty-five cars a day. It is expected that about 100 men will be employed at the start.

Digitized by Google

8/100 of one cent

The cost of telephone service is so small that it has practically no effect on the price of the merchandise you buy.

Yet, the telephone is so necessary to business and social life that its value cannot be estimated.

As an illustration, but eight tenthousandths of every dollar you spend for merchandise in one of Detroit's largest department stores, goes for telephone service.

The amount is so small that it hardly affects the average purchase. Actually it is but eighttenths of one mill out of every dollar spent.

The remainder of the dollar goes into merchandise, labor, taxes, and other items of expense incidental to the operation of the store.

The value of the telephone service to the public and to this institution can hardly be overestimated. It is as valuable to the store's customers as is the merchandise offered the public. But its cost is negligible.

TRANSPORTATION NEWS

Rail :: :: *Water*

Detroit—Fuel and lubricant committees have been appointed for each of the four divisions of the Pere Marquette Railway by General Superintendent E. E. Cain to effect economies in the use of lubricants and oils. The division superintendents are chairmen of the division committees and at frequent intervals will hold meetings with engine and trainmen for instructions and discussion. A general committee has been appointed for the system and will hold regular meetings at Saginaw, Grand Rapids and Detroit. The members of the general committee are: Fuel Supervisor Glenn Warner, Chief Mechanical Inspector C. F. Willoughby, Air Brake Inspector W. C. Groening and Master Mechanics C. K. Wood, Saginaw; W. G. Griffith, Grand Rapids, and C. E. Montgomery, St. Thomas.

Benton Harbor—Judge Clarence W. Sessions, of the United States district court at Grand Rapids, last week released the Graham & Morton Steamship Company from receivership after application had been made by the directors. The company has been in the hands of the Michigan Trust Company, Grand Rapids, since 1915. The new owner is Nathaniel Robbins, formerly of Grand Haven, who took over the line last Spring. All debts have been paid.

Muskegon— A big step forward in the transportation program of Muskegon has just been completed in a survey of the Muskegon situation by Vice-president Rogers of the Pennsylvania Railroad who is in charge of all lines west of Alliance, Ohio. Mr. Rogers was accompanied by a staff of several of the under officials who have been in Muskegon several times lately. In 60 minutes a complete survey of the city, including a trip over the Belt Line by locomotive, was effected, and more than 500 definite and well prepared questions asked and answered. The local men will submit to Mr. Rogers a complete statement in writing of all the matters discussed.

Detroit—According to the Detroit News, the Pennsylvania Railroad expects to begin an extensive building program in Detroit in 1922. The program, it is said, includes the erection of a large freight terminal and construction of tracks over the Pennsylvania right-of-way from Carleton to Detroit. The freight terminal, the newspaper says, will be located on property bounded by Congress, Third, Larned and Sixth streets, which the Pennsy has owned for two years. The project will cost several million dollars. Part of the grading on the right-of-way between Carleton and Detroit was begun some time ago.

Detroit—Delivery of twelve new steel coaches and baggage cars, which were manufactured for the Pere Marquette Railway by the Standard Steel Company, Hammond, Ind., was completed June 20, and all of them are being put into immediate service. President Frank H. Alfred contracted for these some months ago and the final delivery was made June 4. The total outlay represents $645,000. The coaches cost approximately $34,000 each, while the baggage cars represent an outlay of $20,000 each.

Washington—During the first three months of this year, 175 Class 1 railroads in this country reduced their working forces 225,000 men, or 13 per cent, according to a report from the Bureau of Railway Economics. The reduction was due to a slump in traffic and the necessity of cutting operating expenses. Part of these employes were in the repair shops, most of whom will have to be returned to their tasks as soon as the roads have funds with which to resume work. The payroll for these 175 railroads during the three months was $717,425,-173, as compared with $754,653,744 for the same period before wages were increased. Even at this reduction the yearly payroll totals $2,870,-000,000, as against $1,739,000,000 in 1917.

Saginaw—It is expected that the new roundhouse of the Pere Marquette in the Wadsworth yards, will be completed some time in September, and work has been resumed. According to the contractors, probably more than 150 workmen will be on the job within a short time. The roundhouse will have a capacity for housing more than 30 of the largest locomotives.

St. Joseph—A corporation known as the Roosevelt Steamship Company has been organized to operate a line between St. Joseph and Chicago. The steamer Theodore Roosevelt has been acquired for the purpose.

Napoleon, O.—The Detroit, Toledo & Ironton Railroad, owned by Henry Ford, is having its shops enlarged and machinery and equipment transferred here from the Jackson shops, for the purpose of making the Napoleon shops the largest outside of Detroit.

TOLEDO SEES DURANT PLANT

The report is current in Toledo that there is a possibility of Durant Motors starting a plant in that city. There is nothing official about it; in fact no one connected with the Durant organization is known to have made any statement concerning the matter, but for some reason the report has gained some credence because T. W. Warner, who was president of the Toledo Chevrolet Company, retired from this company last week to become a vice-president of Durant Motors.

SPEEDING COAST OPERATIONS

Production of the plant of the Chevrolet Motor Company of California, at Oakland, will be increased within the next thirty days, it is announced by W. C. Williams, until recently factory manager of the Chevrolet Motor Company of Texas, who has been transferred to Oakland to have charge of the California plant.

Y. M. C. A. MAN JOINS M. S. A. S.

A. G. Zeller, president and general manager of the Michigan State Auto School, Detroit, announces that he has obtained the services of Harry Rugg, formerly director of technical education for the United Y. M. C. A. Schools. Mr. Rugg has had a broad experience in technical and automotive work. For fifteen years he was engaged in mechanical engineering, both in designing and manufacturing, and was one of the designers of the original Stanley steam power plant. After two years as a commissioned officer teaching in the Army schools, he put in two years as Y. M. C. A. director, supervising the organization and operation of the Association's auto school and ten machine shop schools. Mr. Rugg is a member of the American Society of Mechanical Engineers, Society of Automotive Engineers and National Association of Stationary Engineers.

Mr. Rugg is devoting his attention to extending the services of the M. S. A. S. along lines of greater co-operation with employers, further improvement of instruction and closer personal touch with the individual student.

FIRST DUESENBERG SHIPMENT

The first shipment of Duesenberg cars will be made July 1 from the plant in Indianapolis. A chassis, roadster and touring car are being exhibited in Indianapolis.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—The Michigan Canned Food Company, whose offices are in Detroit, will build a factory at Ionia.

Cheboygan—The city council and board of city supervisors have passed a resolution not to raise the present assessed valuation of a 1,700-acre tract at Duncan, a suburb, for the period of five years in order to permit A. W. Gregg and others, of Detroit, to erect a 200-room hotel and build a boulevard around the Duncan Bay shore.

Cheboygan—Work has been started by the county road commission on the improvement of six miles of trunk line highway, No. 10, between this city and Aloha. The road will be graded and graveled and the work will occupy the major part of the summer.

Detroit—During the week ended June 18, 279 building permits were taken out, involving an expenditure of $934,710, as compared with $1,531,240 for the preceding week, when 331 permits were issued. A year ago during the corresponding week 302 permits were issued and the cost represented was $4,378,140. Of the 279 permits issued last week, 158 were new construction, to cost $755,625.

Grand Rapids—During the week ended June 10, there were 66 permits taken out, involving cost of $82,465. Among the permits was one for a two-story residence to cost $10,000 and several frame residences and dwellings to cost from $2,500 to $4,600 each. The largest item in the list was for a two-story addition to the plant of the Riverview Furniture Company, to cost $27,000.

Detroit—The price investigation being conducted by the special committee of the Detroit Board of Commerce continues. At the committee's regular meeting, Thursday of last week, figures on prices of eight or ten lines of building materials were reported by the committee's field staff, and the data is being checked to allow each member of the committee to investigate its accuracy.

Grand Rapids—The Colonial Furniture Company has acquired a site, 160 by 260 feet at Lyon and Monroe, and will soon start the erection of a factory structure, two stories high, 64 by 140 feet.

Chicago—Compilations prepared by the F. W. Dodge Company as to building activities in May, show contracts awarded in 37 northwestern states totaled $242,093,000, as compared with $220,886,000 during April. In the central west and portions of eastern Kansas and Nebraska, contracts awarded totaled $264,918,000, which is 10 per cent more than the average for the first five months of the five years previous to 1921. The investigation further shows that during the first five months of this year more than $2,000,000,000 in contemplated work has been reported.

Detroit—The week ended June 16, failed to show many important contracts let by architects or contractors, according to the list of the Builders & Traders Exchange. Among the items is a warehouse to be erected in Hecla avenue for C. L. Ibsen & Company. Residential construction continues to lead. Following are a list reported from the architects' offices: A brick veneer, two-story residence building; a four-story apartment, six stores and thirty apartments; a two-story addition to the United Brotherhood building; a two-story brick veneer residence building to be erected in Chicago boulevard; three brick veneer stores; a brick and steel laundry building; a reinforced concrete garage building; a four-store and apartment building; seven stores and thirty apartments; a two-family frame flat building; a two-story store, assembly hall, bowling alleys and billiard room, and alteration to the Brunswick Shop. A good volume of smaller construction completed the list. Contracts awarded during the last four months show 33 to 50 per cent for housing as against all other classes.

Adrian—Building permits issued from June 1 to 14 totaled fourteen, involving an expenditure of $5,770. In 1920 during the first two weeks of June, nine permits were issued, the cost represented being $2,705.

Alpena—Frank F. Rogers, state highway commissioner, has notified the Alpena county board of commissioners that he has awarded the contract for the construction of Section A of state trunk line road No. 10-18 to John Nelson, Posen, Mich., whose bid was $24,734.81.

A BUILDING QUESTIONNAIRE

The Detroit Steel Products Company has summarized the replies to a questionnaire sent out to 200 nationally known architects, engineers and builders asking their opinion as to whether now is the time to build, and what are the causes for the depression in the construction industry. Among important causes of delayed building activity are listed: Labor disputes, material prices, labor costs, credits, unstabilized conditions, lack of confidence and freight rates. Of those replying 73 look for a gradual return of building activity, twenty-six predict an increase in building next year, twenty-five forecast larger activity in the fall of 1921 and the remainder designate earlier periods for the improvement.

PIONEERING

Recently a bus line was started from the terminus of the D. U. R. at Farmington Junction, and connecting with Farmington, Novi, New Hudson, Brighton, Howell, Fowlerville, Webberville, Williamston and Lansing. The Farmington Enterprise says:

"Just as our larger territories were opened up by James J. Hill and Commodore Vanderbilt with their railroads, so our smaller territories will be opened up by electric lines and bus lines. It takes just as much nerve to establish a bus line through a virgin territory as it does to open up a railroad, for these men have staked their resources in order to open up territories which have no means of rapid transit. These bus lines will bring our neighbors near to us and it is up to us to help these legitimate enterprises, for they will directly benefit our community and business life. Since these lines have gone into operation it makes all the property in the district which it helps to transport richer commercially because the one fundamental way to open up a district is to furnish that district with adequate transportation. Farmington is rapidly coming into her own and the bus lines will help her materially."

CHANGES IN REO ORGANIZATION

Several changes have been made in the Reo Motor Car Company organization. Carl Parker, manager of the London branch, has been transferred to the sales organization at the plant, while George Hopkins has been made branch manager. A branch house will be established at San Francisco to handle the California and Pacific coast business, as well as Far Eastern exports. This branch will be in charge of P. L. Emerson. As an auxiliary, a retail establishment will be opened under the management of Byron C. Foy, at present assistant manager of the Detroit Reo branch. C. P. Green, of the engineering department, will direct the service department at the San Francisco unit.

Some Sights Along Route Of Michigan Pikes Tour

The 1921 tour of the Michigan Pikes Association will bring the tourists through some exceptionally beautiful country, according to John W. Hannen, editor of Michigan Roads and Forests. From Detroit the route leads up the central Michigan pike from Lansing to St. Ignace, passing through Mt. Pleasant, Clare, Grayling and Cheboygan. Between St. Ignace and Newberry the roads are of good gravel construction and the country is partially of cut-over timber, and some of it is still picturesque standing timber. Towns touched between St. Ignace and Newberry are Allenville, Moran and Brevort. From Garnet to Hendrick's Quarry, on trunk line 25, the road is unimproved but the scenery is delightful. Several miles of fine macadam lead into Newberry. Along the west Luce county line to Blaney the road is unimproved but this is a hardwood section and a rolling country. From Blaney to Manistique the highway is practically all well maintained macadam.

At Manistique the big power development plants and paper mills will be of interest From Manistique to Escanaba the entire route is over a tarvia treated macadam highway through a country of cut-over lands. Extensive ore docks at Escanaba will be an attraction. From Escanaba to Marquette, on trunk line 15, is easy traveling over a fine highway through much of virgin forests and trap rock quarries. From Marquette to Ishpeming and Negaunee is one of the finest macadam tarvia treated roads in the state. The mining district will be entered at Ishpeming and Negaunee. One of the prettiest scenic routes in the Upper Peninsula is from Ishpeming to Republic. The Chaping mine will be an attraction in Menominee county and the Menominee Iron Range. From Iron Mountain to Crystal Falls the route follows the Cloverland trail. The road is good gravel all the way.

Near Watersmeet stands a historic pine tree (Lonesome Pine) directly in the center of the road which is built aronnd it and the state highway department maintains it. Just off the highway is Geogebic Lake, one of the largest in the state and recognized as one of the best fishing grounds. West of Wakefield the tourists will pass by the great open pit iron mines where a seven-yard shovel is operated to remove the ore this being the largest implement of its kind in use. After Wakefield the tour will pass through Bessemer, a city maintained by the iron mines and one of the most progressive mining centers in the state. After reaching Ironwood the tour leads to Duluth.

It is noteworthy that this will be the first time in the history of the Upper Peninsula that it has been traversed by an organized automobile jaunt and the officials of the Boards of Commerce in every town and city are co-operating to make it a triumphal tour for the members of the Michigan Pikes Association. Much of the country will be new and more than likely deer will be seen in abundance.

From Duluth the route takes the tourists through Grand Marais to Fort William and the north shore of Lake Superior. It is along this shore that some of the most picturesque country in America will be seen. A day will be spent in the twin cities of Ft. William and Port Arthur and then the tourists will embark on the Noronic for Sault Sainte Marie.

LINCOLN HIGHWAY GUIDE OUT

The Lincoln Highway Association has just published its fourth annual Lincoln Highway road guide. The book, whose purpose is to answer questions regarding the Lincoln Highway for tourists, is in the nature of a memorial to H. C. Ostermann, late vice-president and field secretary of the Association, who was killed a year ago in an automobile accident

A Machine Tool Service Station

In Detroit
where so many Warner & Swasey turret lathes are operating
a Service Station is imperative,
so we put on at 5928 Second Boulevard.

Two practical men are there to serve you—
Men who know Detroit and its vicinty
and who know Warner & Swasey Turret Lathes,
C. S. Stilwell, Manager, and Wm. B. Pope.

Turret lathes of each size are on exhibit there.
You can buy one right off the floor if you like,
and equip it with tools from the stock we keep there,
or you can buy tools for the machines you have.
Our tools are adaptable to any make turret lathe.

Come and look us over—or telephone us.

DETROIT, SATURDAY, JUNE 25, 1921

When the Blind Lead the Blind

TWO important tax measures affecting commerce and industry in Michigan have been passed by the legislature just ended. The first of these is not effective yet in the way of being actual legislation, but is a joint resolution authorizing the submission of a constitutional amendment for an income tax. This measure was presented after an understanding was reached with the legislature that if a corporation tax were accepted by the larger tax-paying organizations of industry and commerce, no income tax legislation would be initiated. However, under the influence of the state administration, the legislature was induced to initiate the income tax amendment. Now, it appears that the form in which it is presented is, to say the least, confusing. It may be worth while interjecting here that the business of drawing tax laws and framing the verbiage in which they appear is not one so easily managed as to permit it to become the subject-matter of haphazard framing and amendment in legislative battles. That was what happened to the income tax amendment, with the result that the form in which it is to be presented to the people authorizes a maximum tax of 4 per cent on net incomes, without describing what net incomes may be in the eye of the law; and, in addition, neglects to say how frequently the tax may be levied. Out of this confusion those who oppose an income tax draw the conclusion that the new amendment, if passed, will not be workable. We wish we could agree with them, because the income tax, as proposed, would derive most of its revenue from the southeast corner of Michigan and the county of Kent, which is an unfair distribution of any part of the public burdens. But it does not seem impossible for the legislature to define what "net" income may be. There may be several entirely reasonable definitions for tax purposes. Whether the fact that the tax levies for state purposes are and have always been made on an annual basis of contribution by the general and special properties of the state may not be read with the new provision for an additional tax may well be left to the lawyers and the courts to determine. But those who are opposed to the income tax need not be too cocksure that if the amendment, even in its present form, receives a majority of the votes of the people, it will not form a sufficient basis for the legislation which it is proposed to base upon it.

The other measure which the tax law handy men put over in the legislature was Act No. 84, Public Acts of 1921, whereby, among other provisions, a tax is imposed on corporations amounting to $3.50 per thousand on paid-up capital stock and surplus.

A careful study of this act shows that hardships will be imposed upon most corporations and that inequalities in assessments will result.

Section 7 of the act says that, "every corporation for profit * * * shall in the month of July or August of the year 1921 and annually thereafter in the same month file a report with the Secretary of State showing its condition at the close of business upon the 30th day of June next preceding the filing of such report."

On page 3 of the blank prepared by authority of the Secretary of State, known as Form 279; it is set out that the information rendered is "a true statement of the condition of the corporation as of the **30th** day of June, 1921."

From the above quotation it is apparent that every corporation organized for profit must attach to its report a true statement of its financial condition as of the **30th** day of June of this year and each succeeding year. In order to prepare a true statement of financial condition it is evident that all concerns carrying an inventory (which are greatly in the majority) must take a physical inventory of all merchandise on hand on the **30th** day of June in order to meet the requirements of the law. This works a hardship on those corporations which do not close their books on June 30, for the reason that an inventory must be taken for the purpose of this report exclusively.

There is nothing in the law indicating that the balance sheet to be submitted could be prepared as of any other date than June 30, which fact would force all corporations whose fiscal year ends at a date other than June 30 to go to the expense of taking an extra physical inventory and besides sustain a loss on account of curtailed business operations. Relief could be provided by allowing corporations to file a balance sheet prepared as of the date of the close of its fiscal year.

It is not certain that the new Form 279 supersedes the old Form 67 which has heretofore been filed as of December 31. We assume, however, that it does, on account of the titles of the two forms being indentical as well as the number of reports (two) required to be filed.

If Form 279 does supersede Form 67 it will undoubtedly become a public record in the county in which the taxpayer is located, which was the case in connection with Form 67. This being the fact, it does not seem fair to force a corporation to attach a detailed statement of financial condition to a report which will be open to the inspection of any one desiring to examine it.

By this act a minimum tax of $50 and a maximum tax of $10,000 are imposed. This means that all corporations with a combined paid-up capital stock and surplus of less than approximately $14,300 will be forced to pay the same tax as those with a net worth of that amount, and that a corporation with a net worth of approximately $2,850,000 will be called upon to pay the same amount of tax as one with a greater net worth.

These provisions impose a penalty on corporations with a net worth of between $14,300 and $2,850,000 for not having a greater net worth, and impose a severer penalty on corporations with a net worth of less than $14,300, for the same reason.

Likewise if a corporation has no surplus but instead a deficit, whether it be the result of operating losses or dividends, no deduction can be made from paid-up capital arriving at the amount against which to apply the tax rate. This imposes a penalty on a corporation for not having a surplus.

Thus some interesting questions are opened up in the matter of the corporation tax. It looks as if the people who drew these laws understood and appreciated neither business nor taxation. It is a case of the blind leading the blind.

Mr. Thomas Speaks

WHEN Samuel Gompers and other organized labor leaders get up before the public or labor union gatherings it is a twenty-to-one shot that every element in this country except labor union members get "razzed" for the present condition of things in business. It has not been our good fortune to observe any other kind of public utterances but scathing attacks on business men in general from any of the more prominent American leaders.

But now from a man from across the Atlantic has come one of the first and most sensible utterances concerning labor. J. H. Thomas, British labor leader, speaking at the Denver convention of the American Federation of Labor, said: "No nation today can lock itself up in a watertight compartment and isolate itself from the rest of the world, and prosper. Do not make the mis-

Digitized by Google

take of thinking that any nation of the world can build a wall around itself. We have been living in artificial prosperity—a fool's paradise. The workers of the world are suffering the inevitable price of living a riotous life during the last six years."

The first sentence shows a keen appreciation of world economics and is first cousin to the statement that we cannot hope in this country to have foreign trade without purchasing goods from other lands. And possibly he also had the thought in mind that foreign countries cannot permanently buy our high priced goods, made with labor costs several times those of foreign countries.

"The workers of the world are suffering the inevitable price of living a riotous life the last six years," says Mr. Thomas. This is an honest admission of the facts. How often were working men reminded during 1919 and 1920 that those were days of "golden opportunity" in which to save part of the swollen wages for the rainy day, but how few profited thereby!

What labor in the United States needs is more leaders like Thomas, who are unafraid of losing their jobs and who are willing to let their future as professional labor leaders rise or fall with the natural evolution in human relations.

Profit, 174 Per Cent

A STORY which, while it may not be true in every detail (you know how a story grows in the telling), illustrates the complaint that the chief reason why economic conditions are not adjusting themselves as rapidly as they should is that retailers have been and are still a bit obstinate about marking prices down somewhere near the level justified by wholesale reductions, is going the rounds in Detroit business circles. It is vouched for by a man of standing, who says he knows.

According to the story, a downtown merchant put into his show window a gown and affixed to it a price tag bearing the figure $29. A rival merchant, strolling down the avenue early in the morning on his way to his own desk, chanced to notice the window and nearly had heart failure when he saw the price mark on the dress. Suspecting that the merchandise was being displayed as a "come-on," he hurried to his store and sent one of his salesgirls over to buy the gown.

When the girl told the clerk she wished to purchase the dress the clerk said he would have to call the floor walker. The latter rubbed his hands together unctuously and was very sorry that the gown was much too small for the customer. It pained him immensely, but there was no larger size of that particular model in the store. Could he show her another "just as attractive?" No, she wanted that gown and none other. She would have it altered, you know. But, the floor walker insisted, the gown was made in such a way that it couldn't possibly be changed without ruining it. The salesgirl stood her ground. She would have the gown. A member of the firm was called. He tried ineffectually to talk her out of it, but when she declared she would have the gown, fit or no fit, and take her chances on the re-fitting, he finally gave in, there being nothing else, apparently, to do about it.

She carried the dress back to her employer's store and there they compared it with others—and, sure enough, it was identically the gown they were asking $160 for.

The merchant, his fury at his competitor's tactics mingled with pride over the neat transaction he had "put over," was telling it to a friend.

"The dirty pup," he blustered, "working the old come-on game! And that was the dress that I paid $68 for, wholesale!"

He paid $68 for it wholesale and was selling it for $160. That's a profit of 174 per cent.

Write your own answer.

We were just getting interested in that new Mexican revolution when we heard that the rebel army included all of 150 men —probably all generals. At that, they may find Mr. Obregon under the bed if they ever get as far as Mexico City.

King George and the British government should rehearse their act a little longer before they put it on. The day after the king pleaded tearfully with the Irish to "be good," assuring them that Lloyd George had only the best of wishes for them, Mr. George sends in a few thousand more troops and declares his intention to declare martial law.

Admiral Sims reached Washington Wednesday, and, bright and early the next morning, after carefully tucking a couple of pillows into his trousers, left for Mr. Denby's office.

Chicago is ashamed to acknowledge it has a building scandal. Chicago should be proud it has enough building to support a scandal.

A congressman from Mississippi has introduced a bill to make it a prison offense for a woman to smoke a cigarette in the District of Columbia. Why drive the poor souls to stogies?

Hamilton Holt is still arguing in favor of our going into the League of Nations. Somebody should wake Hamilton up. He's walking in his sleep.

Somebody wants to establish a tri-county zoo near Detroit. There ought not be much trouble filling it.

The Russians have been accused of most everything in the category of crime. And now it's piracy.

Short Measure Stuff

AHA!

The finest line
Of print or writing,
Is just this phrase:
"The bass are biting!"
—Detroit Free Press.

The greatest words
I've heard to date,
Are: "Come on, boys!
I've got the bait!"
—Hastings (Neb.) Tribune.

That's great, by jing,
And you can bet it!
The bait's the thing—
But where'd you get it?
—Newark (O.) Advocate.

But if the bait
Is all you wish,
Why waste it on
A lot of fish?

FINANCIAL

Is Easier Money Near at Hand in Detroit?

By PHIL S. HANNA

SEVERAL TIMES of late attention has been called on this page to the possibility of a period of more plentiful money supply this summer. And it now appears that such a period is nearly at hand, judging from the trend of returns of the Detroit clearing house banks.

For the first time since the last week of April, 1920, total deposits are greater than total loans and investments. This is most significant. It is possible, of course, that this relation will not continue, but the trend of the figures would seem to point toward continued increases in deposits sufficient more than to offset the gain in the loan item.

By reference to the chart on page 80 in the 1921 Bankers and Investors Annual of this paper (published June 4) the reader will readily follow the trend. Total deposits, which were about $399,000,000 in the middle of May, are now $414,000,000 (June 16), whereas total loans and investments, which were $415,000,000 in May, are now $411,000,000 (June 16). During this same period borrowed money items fell off from $45,000,000 to $39,000,000. It looks as if deposits, according to the detailed chart which is kept up to date each week in this office, are headed for higher levels. Following each gain there is a loss, but since April 1 the total has never dropped back to its low level and is now $39,000,000 ahead of the total on that date.

This, however, is not a promise. It is, nevertheless, a pretty good indication that the money supply of the banks is improving. But, unfortunately, even if money gets really plentiful, it does not necessarily mean a return of flush times immediately. Some veteran observers point out that easier money may mean idle money, a condition not wholly unlikely and one which has occurred heretofore in this country. But one thing is sure, a period of easy money is going to change sentiment and is going to encourage the house-building industry, and whoever can offer a bankable proposition is going to fare heart again, for his chances of obtaining funds will be improved.

It is to be hoped that these encouraging signs are a true forerunner of what is apparently indicated, but time once more is going to be the sole judge, and we shall look forward to next week's report with absorbing interest.

The Purchase and Sale of Foreign Bills of Exchange

By FRED W. ALLEN

THE actual turnover in foreign bills of exchange is really the principal source of revenue of a foreign exchange department, inasmuch as the trading in such bills is practically the only means of meeting obligations abroad.

Bills of exchange might be classified into three different groups; individual, bankers' and export bills. The first class represents nothing more nor less than the withdrawal of funds from banks, as in domestic transactions. These bills are generally clean—that is, not supported by shipping documents.

The second class, bankers' bills, are, as the name implies, drafts drawn by banks in this country upon their correspondents abroad, and represent funds placed to their credit either by demand or time bills that have matured, or the transfer of funds by cable. Bankers' bills are also clean bills, as in the first case. The market value of bankers' bills is governed by the class of the bill alone. So many second-class bills have been offered in the foreign exchange market in the last few years that bankers these days require a strict understanding with the seller of the draft that such drafts will be drawn by prime banks and the bid is made upon the draft accordingly.

The third class, the export bills, are either clean or documentary. In the first case clean bills are, as a rule, drawn by the exporter as representing balances placed to his credit through the payment of obligations due him. Some of the packers find it to their advantage to have meat and provisions shipped from various parts of this country direct to their representatives abroad, payments to be made upon receipt of the shipments and the funds placed to the credit of the exporter, who is then advised by cable regarding his balances. It is his privilege to sell such balances in the open market, either by cable transfer or demand draft.

Documentary bills are drafts supported by the usual set of shipping documents, which includes full sets of bills of lading, invoices, consular invoices, insurance and war risk certificates and any other necessary papers called for in the terms of the contract. The tenor of these drafts ranges from "at sight" to "six months"; but as a rule are drawn at either thirty, sixty or ninety days. It is always to the advantage of the consignee to have these bills drawn at the longest tenor possible in order to allow him to dispose of the goods or the equivalent two or three times before the obligation is due. Such drafts cover the shipments of meat, provisions, flour, grain and cotton, the first two being the most widely offered in the market at the present time

In bidding on foreign bills of exchange, the rate is based upon the demand rate of the day in the city upon which the drafts are drawn and upon the tenor of the drafts. Ordinarily there is no stamp charge made by foreign banks upon individual or bankers' clean bills, but there is a tax on export bills, as well as banker's commission. These charges are deducted from the demand rate, together with interest on the funds for thirty, sixty or ninety days, according to the tenor of the draft.

Under the present market conditions, sales against the purchase of bills of exchange are made, as a rule, so as to permit of their catching the first steamer following that upon which the remittance is made. This practice is considered due to the very violent fluctuations in the foreign exchange market; and while the turnover might result in a smaller margin of profit, the general public is to accept smaller profits and thereby avoid the possibility of excessive losses.

Balances are disposed of by the protection of drafts drawn by smaller banks equipped with the necessary facilities for drawing against your account; also, counter trade as well as city trade. In addition to these various forms, the foreign exchange brokers are at all times in a position to bid upon demand drafts we might have occasion to sell, to meet the requirements of other banks being short on that particular exchange. Drafts, money orders, cable transfers and letters of credit, of course, enter into the final disposition of these funds, inasmuch as they are eventually charged to our account, and the same procedure is followed from day to day to build up our balances as funds are withdrawn.

Mr. Allen, author of the foregoing, which appears in the current issue of "F. N. F." house organ of the Northern Trust Company, Chicago, is manager of the foreign exchange department of that company. Until recently he held the same position with the American State Bank, Detroit.

The American Investment In Oil in Old Mexico

On several occasions reference has been made to possible trouble between Mexico and United States involving the interests of American concerns engaged in crude oil enterprises. Little is known generally as to the number of these companies or their output. In a recent article on the subject, the Boston News Bureau, referring to the production of crude oil by these concerns in 1920 and in 1919 said:

"Mexican Eagle Oil Company established a high record for production in Mexico in 1920, producing 32,381,555 barrels, or 13,583,248 more barrels than in 1919, an increase of about 72 per cent. According to the figures just issued by the Mexican Petroleum Department, total production for Mexico was 156,062,707 barrels, against 87,072,955, an increase of 68,989,752 barrels over 1919, or nearly 80 per cent. Standard Oil Company of New Jersey was the second largest producer.

"The following table shows production of crude oil in Mexico by companies in 1920 and 1919, with change, the figures being the official records of the Mexican Petroleum Department:

Companies	Output in Barrels 1920	Output in Barrels 1919	Increase or Decrease
Mexican Eagle	32,381,555	18,798,307	Inc. 13,583,248
Standard of N. J.	19,340,073	7,172,099	Inc. 12,067,974
Texas Co.	12,526,156	5,709,507	Inc. 6,756,651
Mexican Petroleum	12,513,575	16,946,139	Dec. 4,431,561

Total	156,062,707	87,072,955	Inc. 68,989,752

"The average number of producing wells existing at any one time was 118, making the average annual output of each well 1,300,000 barrels."

WHAT FOREIGN TRADE SHOWS

Government figures on exports and imports for April show $20,717,814 sold to South American purchasers, against $47,026,874 in April, 1920, while we bought from them $30,535,087, as against $76,007,952 a year ago April, resulting in an adverse trade balance for the month of approximately $10,000,000. Exports to Europe were $174,645,581, compared to $364,094,160 in April last year, while imports aggregated $69,146,424, compared to $111,346,889.

Exports	10 months this fiscal year.	10 months last fiscal year.
Trade with Europe	$2,053,315,828	$4,184,087,642
South America	467,919,783	386,418,623
Imports.	10 months this fiscal year.	10 months last fiscal year.
Trade with Europe	$822,352,715	$968,927,520
South America	443,246,673	716,373,697

AN UPPER PENINSULA LINE

A bus service has been started between St. Ignace and Sault Ste. Marie with a vehicle having carrying capacity of 25 persons, and freight. The bus starts at 8 a. m. and arrives at destination at noon, beginning the return trip at 1 p. m., to arrive in St. Ignace at 5 p. m. The round trip costs $5 and the fare one way is $3, which latter rate is slightly below the railway fare.

DETROIT BRASS DIVIDED

The Detroit Brass & Malleable Company has declared the regular monthly dividend of one-half of 1 per cent, payable July 1 to stock of record June 26, 1921.

THE OLDEST HOUSE IN MICHIGAN

Michigan Bond Items

Dillon, Read & Company, formerly W. A. Read & Company, are offering $4,000,000 of first mortgage 8 per cent sinking fund gold bonds of the Hanna Furnace Company, Cleveland, at 99½ to yield about 8.10 per cent. According to their circular, the Hanna Furnace Company is the largest independent producer of merchant pig iron in the United States, operating eight well equipped blast furnaces with a yearly capacity of about 1,000,000 tons. The bonds are to be secured by first mortgage on the entire fixed assets and leaseholds of the company, subject to $440,000 bonds on part of the properties, and by pledge of interests in the Hanna Ore Mining Company and in various ore, coal mining, coke producing, lake vessel and other companies. The bonds will also be guaranteed by M. A. Hanna & Company. Stock of the Hanna Furnace Company, both common and preferred, is listed on the Detroit Stock Exchange, and Detroit is further interested in this company because two modern blast furnaces with a capacity of 700 tons of pig iron are located just south of the Detroit city limits on the Detroit river near the Semet-Solvay Company plant, from which coke supply is obtained. The bonds are dated June 1, 1921, and mature June 1, 1926.

The board of education of the Munising township school district, Alger county, is offering for sale the bonds of the district to the amount of $200,000, dated July 15, 1921, bearing interest at the rate of 6 per cent per annum, payable semi-annually. Twenty thousand dollars of the bonds are due on January 15 in each of the years 1922 to 1926, and $10,000 on January 15 in each of the years 1927 to 1936, both inclusive. Both principal and interest of the bonds are payable at the Continental & Commercial National Bank, Chicago. The assessed valuation of the district is $6,535,101, and the debt of the district, including these bonds, $200,000. Bids should be addressed to Theodore W. Scholtes, secretary of the board of education, Munising, and be in the hands of the secretary on or before 12 o'clock noon, July 1, 1921.

A syndicate composed of the Guaranty Trust Company of New York, the National City Company and Harris, Forbes & Company has purchased $2,000,000 of Detroit street railway bonds. There were four bidders. The syndicate will pay 100.27 per cent and accrued interest to date of delivery. Half of the bonds will pay 5½ per cent and the other half 6 per cent. The bonds are part of the issue of $15,000,000 authorized by the people for the construction of the municipal street railway. Issuance of these bonds will bring the total sold to $6,750,000.

"What steps will be taken by the city to satisfy, if possible, holders of the $25,000 municipal bonds recently coming due, and the money for which attorney J. T. Pingeman, representing the Superior Trust Company, demanded of the council Wednesday evening, is a question that promises to loom high on the horizon," said the Houghton Gazette a few days ago. "Mr. Finnegan's demand is the initial legal step toward having the bonds taken up. That the city's financial condition does not permit retiring the issue is no secret."

The Central Union Trust Company, New York, has been appointed trustee of $13,500,000 of the Maxwell Motor Corporation's one, two and three-year, 7-per-cent gold notes, dated June 1, 1921.

The Genesee county road commission, Flint, has sold to Keane, Higbie & Company, Detroit, approximately $380,000 of Covert act road bonds at par and accrued interest.

A special election will be held in Owosso, June 28, to vote on a proposal to bond the city for $500,000 for the purpose of erecting two ward schools and a high school building.

The city of Saginaw will offer for sale, July 1, $200,000 of 10-year street improvement bonds, dated July 1, 1921, and bearing 5½ per cent interest.

Bond issues of $1,650,000 for the erection of a city light and power plant were approved by the Lansing city council last week and will be submitted to the people at a special election.

Otsego has voted, 468 to 118, in favor of bonding the town for $60,000, the money to be used for paving purpose.

The city council of Escanaba has authorized the issuance of special assessment bonds of $13,500 which will bear interest at the rate of 6 per cent and will run for a period of five years, to pay the city's portion of paving fourteenth street.

A special election will be held in Owosso, June 28, to vote on a proposal to bond the town for $500,000 for school building purposes.

Van Meer township, Munising county, has decided by a vote of 32 to 4 in favor of bonding the township for $15,000 for highway improvements.

A special election will be held in Owosso, July 7, for the purpose of deciding the question of bonding the city in the following amounts: $20,000 for extension of water mains; $23,400 for storm sewer and $3,300 and $2,800 for paving.

The voters of Bay City have approved a bond issue of $1,400,000 for school building construction.

CITY NATIONAL, BATTLE CREEK

The City National Bank of Battle Creek, formerly the City Bank, is publishing figures running back to June 2, 1871, showing the growth of the institution. Total resources on the date mentioned were $35,294.89; July 2, 1881, ten years later, they were $365,922.20; July 9, 1891, $612,868.30; June 2, 1901, $1,383,987.55; June 2, 1911, $1,789,334.45, and June 2, 1921, $4,764,189.27. E. R. Morton, a brother of John Morton, who is interested in the new Commercial State Savings Bank of Detroit, is vice-president and cashier of the Battle Creek institution.

NATIONAL GROCER DIVIDEND

The National Grocer Company has declared the regular semi-annual dividend of 3 per cent on the preferred stock, payable July 1 to stock of record of June 20, 1921.

INSPIRATION CONSOLIDATED

Forty mining claims on Pinto creek, Arizona, are reported to have been acquired at a cost of $44,000 by the Inspiration Consolidated Copper Company.

U. S. Enterprise Forestalls German Competition

By P. A. E. ARMSTRONG

RUSTLESS and stain-resisting steels have been the subject of keen investigation by American, British and German organizations and there has been a race to produce a stain-resisting and rustless steel at sufficiently low price to enable it to be generally used for cutlery and other rust-resisting applications, such as surgical instruments, dental plates, needles, etc., for general scientific and household use. Other large applications for this steel are turbine bucket blades for steam turbines, marine hardware, propellors in the place of bronze for ocean-going boats, submarine periscope tubes, dairy machine parts, steam and water fittings, and for many uses that a strong rust-resisting material can be put to.

The three principal centers of investigation are: Thomas Firth & Sons, Sheffield, England, the inventors of the so-called stainless steel; Krupp Company, Essen, Germany, inventor of a high chromium nickel steel, and who, without a doubt, started prior to Sheffield in its investigations, and the Ludlum Steel Company, Watervliet, N. Y., which has developed the inexpensive low chromium, high silicon steels.

This latter development is an extremely stain and rust-resisting combination. It has heretofore been considered by metallurgists that silicon is an alloy which should not be used in quantities but this has been proved a fallacy and at the most only applies to iron-silicon combinations and not to chromium alloys; in fact, peculiarly enough, silicon enables chromium and vice versa to form a useful combination, whereas without the silicon a mechanical alloy is about the most that can be expected, chromium having an affinity for carbon, and in steel the principal alloy or staple alloy or nearly so that is formed is the chromium carbon compound known as chrome carbides. The remainder or excess chromium is mixed with the iron in a form of mechanical mixture which can be fairly readily separated out from the iron; therefore a spotty combination is formed of chromium on the one part and iron on the other, which accounts for the mysterious rusting of a high chromium steel, which although chemically the right analysis is physically incorrect.

The use of nickel as per the German investigation stabilizes the combination of the chromium and iron but it adds to the softening and machining difficulties and large quantities of chromium have to be used in combination with nickel to produce a stain-resisting and rust-resisting steel. For instance the German rustless steel contains about 22 per cent chromium and 2 per cent of nickel, balance iron, with low carbon. The English combination as made in Great Britain and in the United States is about 13 per cent chromium, balance iron, with low carbon.

The new American development which is sold at half the usual prices and at very little more than ordinary steel contains chromium 7 per cent and silicon 3 per cent, with the balance iron, with low carbon. If it were not for the very high silicon content, this material would be easily rusted and readily stained, the two things being quite the same; but another way of expressing the same thought as a stain mark on steel from domestic use is nothing more or less than accelerated rusting by chemical action, but the mark or stain is iron oxide. Therefore staining and rusting technically and practically are the same thing.

German competition in cutlery is being keenly felt at this time and, without a doubt, the German rustless steel would be very largely employed in the United States; but due to the enterprise of the American manufacturer, this competition has been forestalled, as the cost of the high chromium nickel steel of the Germans could not be sold, even though their rate of exchange is so low, at a price which would compete with the low chromium, high silicon steel.

The United States has not employed stain-resisting steel for its cutlery to any large extent. This type of material is very largely used abroad and one of the reasons for this is the lower cost in foreign countries. The new low chromium silicon steel can now be sold at very low cost, namely 35 cents a pound, as compared with stainless steel at 75 cents a pound, thereby enabling the cutlery manufacturers to offer to the buying public a very keen edge, stain and rust-resisting cutlery at a greater price than the plated knife. It will be but a short time before the housewife can take her choice of the hardware store of a plated knife or a stain-resisting, rust-resisting sharp steel knife at about the same cost.

The cutlery manufacturers realize that this new development assures them a very big market in this country, free from German competition. The public and the cutlery manufacturers will thereby benefit and keep the money in this country, enabling labor and enterprise to go on unchecked.

This new steel is sold under the trade name of Neva-Stain, which is a very apt term and means what it says—that it, it will never stain.

Northeastern Michigan's Parks Awaiting Tourists

State parks in northeastern Michigan will soon be offering to the automobile tourist who seeks the hundreds of lakes, the trout streams and the forests of the northern part of the state, ideal camping spots for his tour or at which to spend his vacation, according to T. F. Marston, one of the members of the state conservation board, which among other duties has the care and operation of these parks in its charge.

Starting at East Tawas, there is a park on the shore of Tawas Bay, located close to the business section of the city, equipped with a commodious bath house and on which a rest room and community building is now being erected which will provide a place for all kinds of gatherings, dances, etc. At Harrisville is another state park, located on the shore of Lake Huron, where there is plenty of room for campers, an abundance of fuel, good swimming and fishing. The woods on this park are now being cleaned and a bath house, toilets and a pavilion will soon be erected.

At Onaway is located one of the largest of the state parks, consisting of 152 acres on Black lake, with all kinds of camping locations, from thick woods to fairly open ground, sandy and gravelly beaches and at one end an old stone quarry. The work of improving this park is well under way and it will be equipped with boat and bath houses, a pavilion, summer kitchens and good drinking water. Cheboygan has a beautiful state park with opportunity for camping and picnicking, supplied with good drinking water, but not located on the lake front. The state park at Old Michillimackinac with its associations running clear back to the days of the French explorers and the war of 1812, offers the next stopping place. This park is the most complete of any and offers every convenience to campers. All of these parks are located upon or close to the Dixie highway.

Coming down the center of the state on trunk line highway No. 18 some equally interesting and picturesque spots are offered the tourist. The first will be the Indian River state park, located on the south shore of Burt Lake, with some 80 acres of woodland, a fine stream running through it and a water supply furnished by an extremely active flowing well. Next will come the Hanson Military reserve, not controlled by the conservation commission but which will be available, through the commission, for camping purposes when not in use by the national guard, under rules laid down by the state military board. The Otsego state park, which has been accepted but on which work has not yet been started, will be located on Otsego Lake and will have all the conveniences of the other parks. The Gladwin State park is located on Cedar river, just inside the city of Gladwin, has a fine flowing well and offers many other conveniences to campers.

In Clare county Wilson park, located on Budd Lake, has been developed as a city park, and while not owned by the state, is open to tourists and campers. On the western side of the state are a number of state parks which will also be available in the near future but work on them has not yet advanced so well as on those of the eastern side of the state.

MOTOR TRUCKS AND RAILROADS

The Firestone Tire & Rubber Company, Akron, O., calls attention to a law recently passed by the legislature of New Hampshire raising the tax on motor trucks. On a 2-ton truck, for example, the tax is increased from $15 to more than $200. Here is what Firestone says about it:

"Up in New Hampshire the legislature has passed a law raising the tax on a 2-ton truck from $15 to over $200.

"By logging otherwise inaccessible timber tracts and other means, trucks have proved valuable as railroad feeders in that section.

"Would not this be a good example to cite to the railroads, showing them that the motor truck is really their asset?

"An example: For several years prior to 1916 the income of the Boston & Maine was gradually dwindling. Since then it has increased steadily. Income in 1920 was over 60 per cent greater than during 1915.

"It is at least significant that the income of the Boston & Maine began to increase about the same time that motor transport began to be effective.

"How much of the increased income is due to motor truck feeders? Did anyone think to call this angle to the attention of the railroads and solicit their aid?

"The law becomes effective Jan. 1, 1922."

The Kent State Bank, Grand Rapids, in addition to declaring the regular quarterly dividend of 3 per cent, has declared an extra 4 per cent to care for taxes, making an increase of 1 per cent in the dividends over last year.

The American Beach Magnetn Company has passed the quarterly dividend of 87½ cents at this time.

Action on the preferred stock of the American Agricultural Chemical Company has been deferred until the dividend on the common stock passed. A statement was issued as follows:

"Directors of the American Agricultural Chemical at the regular quarterly meeting decided to defer action on the preferred dividend. The fiscal year will end June 30. In previous years under normal conditions it has been possible to forecast with reasonable accuracy the fiscal year's results, but conditions in the fertilizer industry have been abnormal for some months past. Therefore, until inventory taking has been completed and the results for the full twelve months to June 30 have been prepared and examined, directors felt it conservative to defer action on the preferred dividend.

"American Agricultural continues in strong financial condition. Its collections during the last year, south and the South and Cuba, have been remarkably good and compare well with those in any other year.

"Sales for the fiscal year will be about 65 per cent of the previous year. Prices have been well adjusted and inventories of raw materials and manufactured goods will be written down to current market prices as June 30, which has been the established custom of the company.

"It should be borne in mind that the dividends on the preferred stock are cumulative at the rate of 8 per cent per annum."

The J. I. Case Plow Works, which three months ago passed the dividend on its second preferred stock, has now passed the dividend on the first preferred.

LUCIUS M. WING DIES

Lucius M. Wing, president of the Coldwater National Bank for several years, died June 21 at his home in Coldwater. He had been in the banking business more than thirty years and was prominent in social and civic organizations.

HOLLISTER GOES TO LONDON

Clay H. Hollister, president of the Old National Bank, Grand Rapids, is a delegate to the meeting of the International Chamber of Commerce, June 27, in London, England. More than 250 Americans will attend this first annual meeting, which will represent virtually every phase of American business, and where world trade problems will be discussed. The object of the meeting is the betterment of international trade relations. Lemuel S. Hillman, editor of the Old National Bank Bulletin, describes the new organization as the "Business League of Nations."

STANDARD REAL ESTATE ELECTION

At the annual meeting of stockholders of the Standard Real Estate Company, Lansing, directors were elected as follows: R. B. McPherson and Hugh A. McPherson, Howell; Roy D. Chapin, Detroit, and F. N. Arbaugh, T. A. Lawler and L. B. Ayres, Lansing. The directors named the following officers: President, Hugh A. McPherson; vice-presidents, F. N. Arbaugh and T. A. Lawler; secretary-treasurer, L. B. Ayres; assistant secretary, M. A. Hess. F. A. McKibbin, who has been vice-president of the company for several years, retires to enter the real estate business under his own name. The assets of the Standard company and its affiliated companies have grown from $25,000 to more than $1,000,000. It will now develop the 40 acres adjoining the new Durant Motors plant.

STUDEBAKER IMPROVEMENT

Since January 1 there has been a $11,000,000 improvement in the quick assets position of the Studebaker Corporation, according to word from South Bend. At the beginning of the year the corporation had $8,500,000 of bank loans. These have all been paid and in addition there is now $2,500,000 of cash on hand.

Who's Who In Michigan Finance

Scott E. Lamb, Chief Examiner, Michigan Department of Banking

Scott E. Lamb is the third member of the Michigan banking commissioner's staff to become chief examiner and has reached his goal after three years of serious application to the technicalities of the bank examining business.

SCOTT E. LAMB

Mr. Lamb was born at Dryden, Mich., in 1894, and received his schooling in that village and in the Imlay City High School, from which he graduated in 1913. In 1917 he graduated from the University of Michigan in the school of banking administration, having specialized in banking and accounting. His banking experience includes a service with the Lapeer County Bank, Imlay City, and the American State Bank, Detroit, going from the latter to Lansing in June, 1918, to become chief clerk of the banking department under F. W. Merrick. His ready familiarization with the work won him an examiner's commission in October of that year and since that time he has had extensive experience in examining banks and trust companies.

Mr. Lamb succeeds H. O. Mohrmann, who became deputy commissioner, June 15.

LINK-BELT BUYS CALDWELL

The Link-Belt Company, Chicago, has acquired all the capital stock of the H. W. Caldwell & Son Company, and Frank C. Caldwell has been elected a director of the Link-Belt Company. While the H. W. Caldwell & Son Company's plant will continue to operate under separate corporate existence and under its present name, the joint facilities of the two companies, and the broader avenues of distribution of the Link-Belt Company, are expected to prove of advantage to customers of both. The plant management will remain substantially the same.

STANDARD PARTS REORGANIZATION

Preferred and common stockholders of the Standard Parts Company have agreed to hold out for an extension of the receivership until business conditions improve, according to a dispatch from Cleveland. This means that they will reject the reorganization plan proposed by the creditors.

JACOBY HEADS MITCHELL MOTORS

The Mitchell Motors Company, Racine, Wis., has elected William L. Jacoby president.

Public Utilities

NEW LANSING CONTRACT SIGNED

The Lansing city council has renewed its contract with the Michigan Railway Company for another year. A resolution was adopted setting forth that the new agreement would in no way affect the arrangement entered into by the city and company which provided that when the railway company reduced wages a corresponding cut in fares would follow. The company recently cut the wages of its employes. The fares are now 10 cents, four tickets for 30 cents. A resolution has been adopted to take up with the company the question of lowering fares at once.

LIGHTS—PHONE QUIZ ORDERED

The Detroit common council has authorized an investigation of the finances of the Detroit Edison Company and the Michigan State Telephone Company, looking to a downward revision of rates. Both Alex Dow, president of the Edison company, and Franz C. Kuhn, president of the telephone company, have expressed their willingness to co-operate with the city authorities in the investigation.

TEST SUIT INSTITUTED

The Moore Telephone Company, which operates several exchanges in Tuscola county, has filed suit in the Ingham circuit court to test the authority of the Michigan Public Utilities Commission to order one phone company to make physical connections with another. The bill of complaint alleges that the order of the Commission requiring physical connection of the Moore system and the Valley Home exchanges in Caro and surrounding towns will result in destruction of the business of one of the companies, that it is unfair and that it was inspired by a desire to destroy one of the exchanges.

AGREEMENT AT CHARLOTTE

The city council of Charlotte and the gas company have reached an agreement whereby the company may not realize more than 8 per cent profit on the investment. A temporary rate of $1.85 is established. It was agreed that the city was to have free access to the books and each year the rate may be raised or lowered according to the cost of production.

LOWER CAR FARES IN DETROIT

Five-cent fares, with a one-cent charge for transfers, went into effect Sunday, June 19, on the D. U. R. city lines in Detroit. The rate superceded was six cents cash fare, nine tickets for 50 cents. The proposal was made by the company.

UNITED GAS & ELECTRIC

Gross earnings of $12,372,738 for the year ended April 30, are reported by the subsidiaries of the United Gas & Electric Corporation. This is an increase of $1,442,399 over the preceding twelve months.

WRIGHT-FISHER RECEIVERSHIP

The Security Trust Company, Detroit, has been appointed receiver for the Wright-Fisher Bushing Corporation, recently adjudicated bankrupt. The corporation, whose product was being manufactured for it under contract, was preparing to locate a plant of its own at Holly, when the bankruptcy proceedings were instituted.

NEW HANNAN TRUSTEE

The Wayne county probate court has appointed the Security Trust Company, Detroit, a trustee of the estate of the late W. W. Hannan, succeeding the late Flavius L. Brooke. The other trustees of the estate, which includes extensive real estate holdings in Detroit, are Mrs. Hannan and Matthew Slush, the latter of Mount Clemens.

Quality vs. Quantity Circulation

St. Louis Trust Company Official Gives Financial Advertisers a Few Pointers

JULIUS C. PETER, assistant to the president of the Detroit Trust Company; H. F. Pelham, of the same company; Clinton F. Berry, of the Union Trust Company, and H. B. Grimm, of the Security Trust Company, returned this week from Atlanta, Ga., where they attended the sixth annual convention of the Financial Advertisers' Association.

One of the principal addresses of the convention was that of A. E. Bryson, of Halsey, Stuart & Company, Chicago, entitled "Popularizing Bonds," which was printed in full in last week's issue of this paper. Another was "Financial Advertising from the Reader's Angle" by Herbert S. Houston, of World's Work. G. Prather Knapp, of the Mississippi Valley Trust Company, St. Louis, made a keen analysis of the daily newspaper as an advertising medium. In his address, entitled "Your Daily Newspaper and Its Use by a Bank," he advised his hearers not only to know the quantity of circulation of a paper but to look more particularly into the quality of it.

"If your appeal is for counter business in a savings department you will only be interested in circulation among those who live or work or shop in the business section of your town," he said. "Large mail circulation will not interest you. If you are advertising real estate for sale, the same thing will be true. If you are seeking business for a bond department, an out-of-town circulation may interest you, but it must not be a rural circulation because farmers do not buy bonds."

He also pointed out that there was often a vast difference between the kind of people who read one newspaper and the kind who read another and also that there was a difference between the responsiveness of the same reader to advertising in different newspapers, but most important, said Mr. Knapp, was the effect of a newspaper's editorial policy on its utility to an advertiser.

"Suppose we look at a newspaper which asks us for advertising in the same way that we would look at competing restaurants in which we are offered an opportunity to address a few remarks on our business to the gathering of diners," he said. "Would we choose the conservative, quiet place, noted for its good food and its quiet assembly of patrons, or would we choose the glittering lobster palace just across the street, where there is of little consequence and where the patronage is gained by a jazz orchestra, a blind tiger or a Mack Sennett cabaret?

"Therefore we are not old fogies or reactionaries when we apply the same test with the same result to the conservative newspaper as against the sensational newspaper. It is all well to say that the people demand sensational news and entertainment features in a newspaper. Perhaps they do, but the successful newspaper, from our angle, is the one which fills a fundamental demand—that for the solid food of clean news, constructive editorials and useful information.

"There is a definite opportunity for public service in closer relations between bankers and newspaper men. Far from being a different sort of people, they are a very similar sort. Vanderlip, Stedman, Sisson, Ellsworth—here are four examples of writer-bankers, men whose qualities won success in both fields. Bankers and newspaper men are just the sort of people who can and should get together. Get to know editors and reporters who find and serve up the news which makes our advertising valuable, and see if you do not agree with me, say, it is certainly up to us to study the personal element in newspaper service.

"The most valuable advertising which a financial institution or any institution ever receives is unpurchased and unpurchasable. Let me lay particular emphasis on that word unpurchasable. The editorial co-operation which you secure as a result of advertising space or the editorial space which you obtain through appeals to the business managers of newspapers rarely does you much good and sometimes does you real harm. But the editorial co-operation which you can secure by man-to-man relations with the editors and reporters is the most valuable good will that you can win for your bank.

"We can learn a great deal from journalists, we financial advertisers."

Mr. Knapp paid his respects to publishers who refuse misleading advertising and concluded that the money which can be spent for advertising so refused was more than offset by the increased value to the advertiser of that space which is sold.

"The ethics of the business have been changed and improved to such an extent that we practically have editors of advertising in most high grade newspapers, and I think we will all live to see the day when the advertising editor will be a duly recognized member of every large newspaper organization," he said.

Recently, an effort to find whether his bank was doing all that other institutions were doing for customers it was arranged with the Globe-Democrat, of St. Louis, to have a reporter open a savings account in every bank in the city. The reporter was given a list of instructions and a questionaire and was asked to make an individual report on the convenience, cordiality and service of each institution, and a general report in which he rated all institutions.

"His reports," said Mr. Knapp, "were of great value to our savings department and to our advertising department. He discussed us and our competitors without fear or favor, for he was assured that he had promised the scheme, and his criticisms, many of which were directed at our own institution, were invariably constructive."

FRENCH IMPORT TAX EXPLAINED

The Review, Paris, published by the American Chamber of Commerce in France, quotes the following explanation given recently by the French Minister of Finance concerning the tax on business as it may affect imports of merchandise from foreign countries. It is a matter of interest to American exporters.

"With regard to the turnover tax (impôt sur le chiffre d'affaires) of 1.10 per cent, the Minister of Finance was asked by a deputy to define the position of a foreign (English) firm having a branch in France and billing merchandise to that branch, whether the firm must pay first the 1.10 per cent on the entry of the merchandise and again 1.10 per cent on the amount of the sales made by the branch; or whether, after having paid the 1.10 per cent at the entry, it should be held to pay, after the sales made, only on the difference between the value of the merchandise billed to the branch and the sums realized by the sales.

"Reply: (1) All importations of merchandise are subjected to the tax of 1.10 per cent or 10 per cent, according to the nature of the merchandise, no matter who the importer may be (law of June 25, 1920, Art. 72 first clause). The tax therefore is due even when the importation is the result not only of a purchase abroad but also of the simple sending by a foreign firm to a branch in France; (2) the levying of the tax of 1.10 per cent as the moment of the entry of the merchandise does not prevent that of the turnover tax (impôt sur le chiffre d'affaires) at the moment of sale, by the importer, in France, of the said merchandise, in accordance with Art. 59 of the law of June 25, 1920, because the case concerns two taxes entirely distinct, arising from different causes. The turnover tax, also by reason of the sale effected by the importer, therefore should be calculated on the total price of that sale and not on the difference between that price and the value assessed for the import tax. Article 62 of the law of June 25, 1920, explains, furthermore, that, in the cases of the persons selling the merchandise, the amount of the taxation is determined by the total price of some of the sales effectively and definitely realized, without question of any exception."

CANADIAN-U S. TRADE

Canada's total trade with the United States in April was $64,549,005, representing nearly two-thirds of the Dominion's commerce with the world during that period. The total trade between the two countries for 1920 was $88,481,626. The total for April of this year, therefore, shows a decrease of $24,000,000.

Canadian exports to the United States were $32,974,951, a decrease of nearly $3,000,000 compared with April, 1920. Imports were $41,570,054, a decrease of $20,000,000 as compared with April, 1920. The adverse balance of trade with the United States for April was $18,599,103, as compared with an adverse balance for April, 1920, of $37,507,036.

For the ten months ended with April the Dominion's trade with the United States was $1,374,985,266, an increase of $85,000,000, as compared with the total for the twelve months in 1920. Exports to the United States were $539,792,107, an increase of $74,000,000. Imports for the period were $835,193,159, an increase of $14,000,000. The adverse balance of trade was $295,401,052, as compared with an adverse balance for the corresponding period of last year of $355,293,156.

Canada's trade with the world shows a marked improvement. The twelve months ended April 30 found the Dominion with a favorable balance of trade of $27,096,954. For the corresponding period ended April 30 of last year, Canada had an adverse balance of $119,795,696. The returns for the twelve months ended April 30 of this year therefore show a favorable variation of $146,886,650.

CANADIAN PACIFIC EARNINGS

The Canadian Pacific Railway Company reports April gross earnings were $13,761,840, as compared with $15,929,416 a year ago. The net after deduction of expenses was $2,646,131, as compared with $2,241,846 in 1920. For the first four months of this year the gross earnings totaled $55,701,984, as against $59,117,025 in 1920. The net was $6,551,856, as compared with $5,589,424 for the corresponding period in 1920.

N. A. C. C. ISSUES TAX BOOKLET

Summarization of the statements made before the Senate committee on finance by C. T. Hanch, chairman of the tax committee of the National Automobile Chamber of Commerce, and George M. Graham, vice-president of the Pierce-Arrow Motor Car Company, Buffalo, is contained in a booklet issued by the Chamber under the title of "National Taxation Policy." The booklet says that $267,000,000 in "stigma taxes" are paid yearly by motor car owners by which is meant special taxes.

Satisfied, Dealers Say

(*Continued from Page 6*)

question that we are beginning to have better times, as we find more ready money in sight, meaning that purchasers are better able to pay cash."

Bemb-Robinson Company (Hudson and Essex)—"Business is improving and we cannot complain, considering everything. Our sales so far this month have reached the total for all of May. More cash seems to be available for buying, which is always a good sign. The outlook for the next month or two appears to be good."

Buick Motor Company—"We have been selling Buick cars right along, and we are selling more of them now since the price redjnction. The cut has stimulated buying and there is no reason to doubt that demand for standard cars will increase. We believe business will keep up, although predicting what it may be in another 60 days is something too hazardous these days. It is, however, not hazardous to say that salesmanship counts for more than most anything else. Sitting in an easy chair and waiting for prospects to come in is not going to sell many cars from now on. The dealer who expects to do business must hustle. He may not sell every car he would like to sell, but he will surely be able to sell some."

Reo Motor Car Company, Detroit Branch—"We can't complain, notwithstanding that sales are not quite up to what they were. We have a good many sales lined up, but owing to general business conditions these are being held in abeyance. They have not been cancelled. Everything considered, Reo business thus far this year has been very satisfactory here."

Dodge Brothers, Detroit distributor—"How is business with us? Why, man, we can hardly find time to go out and eat. Since the price reduction we have been swamped with orders. From Monday, June 12, to Friday, June 17, we sold 146 cars—all new ones. There seems to be money in plenty. In fact we have been considerably surprised at the large percentage of cash orders. It is certainly a good indication as to the business trend. We feel the outlook for the next 30 to 60 days is good and expect to keep on selling more cars than we can get."

Another Detroit Buick distributor—"The outlook is bright although nobody can foretell what may happen over night. As far as the Buick plant is concerned, the latest information is that orders are pouring in from all over the country and it probably is only a matter of time before a normal production of 500 cars a day will be reached. At present the output has passed the 300-a day mark."

Packard Motor Car Company, Detroit Branch—"So far this month business has been very satisfactory, especially in the passenger car line. In fact, the first year has been a big year for Packard. The demand for trucks is not what it might and should be, but that is due to general business conditions. We have a good list of prospects for trucks but they will not buy until their own business has picked up. As to the future, we are, as always, optimists."

Thompson Auto Company (Maxwell and Chalmers)—"Business has been 20 per cent better during the first half of June than it was in May. We can't say that it is what it should be, but nevertheless we are satisfied and feel confident."

Nash Distributing Company—"Sales and inquiries have been thus far this month up to what they were in May. The next four or six weeks should still show good business. Price reductions have naturally been a big factor recently and many prospects are waiting or have been waiting. However, all matters considered, we do not think we need be worried."

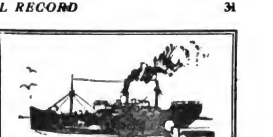
Simons Sales Company (Overland and Willys-Knight)—"Business has been very good indeed —about double what it was in May; and that was a good month with us. If you have a car of standing, and if you are a good salesman, you can sell cars. The best indication that the Overland company's business in general is increasing is to be had in the statement from the factory that until further orders, daily output is to be 500 cars."

A distributor whose names and car is withheld at his request—"Notwithstanding that the price of our car has been reduced a second time sales so far this month are not as good as last month, or last April. Just what the reason is is rather difficult to guess at, because when the first price reduction was made sales jumped up immediately. We think, though, that the present condition won't last very long."

Baker-Fisk-Hugill Company (Dort)—"Sales are increasing nicely. So far this month—first half—we have done as much business as during all of last month. We hope it will keep up but we cannot prophesy."

The Detroit distributor for a Michigan-made car—"No, it isn't true that business with us is either better or as good as it was a month ago. The reason is the price situation, which for several months has created more disturbance and more withholding of orders than anything else. Now, when practically all the makers have reduced prices there is a possibility of better times coming to us, but you must also realize that it is getting late in the selling season and that we are approaching the time when it is generally known that the manufacturers are preparing their next year's models. That is not exactly going to help increase sales. As far as the price cutting is concerned, it has taken place at the wrong time and it is to be hoped that the industry will get together and see that it does not occur again right in the middle of the selling season."

Frank P. Gmelin (Briscoe and Mitchell)—"The outlook is brighter and within another thirty days I believe sales will be much better. Unsettled conditions in general have not helped the automobile business. But we cannot complain on account of the very fact."



Detroit Cadillac Branch—"Business has been fair and it is not unlikely that it will improve. We hope for a steady increase in sales but it is difficult to say what tomorrow has in store for us."

Lincoln Motor Company, Detroit Branch—"We are satisfied with the way business is coming. We are selling cars, and that is the big thing. There is no cause for complaining."

Chevrolet Motor Company, Detroit Branch—"Sales have been very good, especially on our smaller models. The general outlook is good and we venture to say that it will remain such for the next 30 to 60 days."

Detroit Ford dealers—Four of the local distributors were questioned. Three stated that business was decidedly good and one that it was about as in May. Case of being able to make prompt deliveries, said the first three. Matter of price is being discussed more than formerly. However, it is not any more difficult to sell a Ford now than a year or two ago. The millions of these vehicles in use is the big talking point or sales factor with many, and it is a convincing argument. Outlook for the next 30 to 60 days is said to be good by three of the dealers. The fourth man would not "tie a prediction even for next week.

In announcing a reduction of from $200 to $345 on the American Six, the American Motors Corporation, Plainfield, N. J., adds that

the new prices are guaranteed until January 1, 1922. New and old prices are:

Model	New Prices	Old Prices	Reduction
5-pass. touring	$2,195	$2,395	$200
5-pass. roadster	2,195	2,395	200
7-pass. touring	2,375	2,475	200
4-pass. sport	2,350	2,595	245
Sedan	3,150	3,495	345

The F. B. Stearns Company, Cleveland, is quoted by its Hartford, Conn., distributor as having advised its dealers that there will be no reduction in price on the Stearns-Knight, which was brought out in 1919 selling then at $2,550 delivered in Hartford and listed now at $2,750.

"There will positively be no reduction in the price of the Stearns car this year, nor do we believe at any future time," so states the factory," says the dealer's announcement. "If any savings in labor or material cost appear, that saving will be built into the car in added equipment and refinements."

President John N. Willys, of the Willys-Overland Company, Toledo, says that since the price reduction on the Overland and Willys-Knight, business had been steadily gaining and that there are now more than 15,000 unfilled orders at the Overland plant. Trainloads are being shipped to many parts of the country.

The J. C. Wilson Company, Detroit, has reduced the prices of it's trucks as follows:

Model	New Prices	Old Prices	Reduction
5- ton	$4,620	$5,275	$755
2½-ton	3,825	4,300	475
1½-ton	2,925	3,305	475
1-ton	2,270	2,650	380

The Bessemer Motor Truck Company, Grove City, Pa., has lower prices in effect. New and old prices are:

Model	New Prices	Old Prices	Reduction
G—1- ton	$1,395	$1,700	$305
H—1½-ton	1,995	2,445	450
J—2- ton	2,595	3,285	690
K—2½-ton	3,495	4,485	990

The White Company, Cleveland, announced new prices on its trucks the cut ranging from $200 to $600. One model, the 5-tonner, is listed now as in 1914. New and old prices are:

Model	New Prices	Old Prices	Reduction
45—5- ton	$4,500	$5,000	$500
40—3½-ton	4,200	4,500	300
20—2- ton	3,250	3,450	200
15— ¾-ton	2,400	2,600	200

From $200 to $600 has been cut off the prices of the Lexington cars by the Lexington Motor Car Company, Connersville, Ind. The prices, new and old, are as follows:

Model	New Prices	Old Prices	Reduction
S—Touring	$1,885	$2,285	$400
S—Thirty-fifty	1,985	2,385	200
S—Lex-Sedan	2,185	2,785	600
S—Coupe	2,150	2,350	200
S—Sedan	2,150	2,350	200
T—Touring	2,785	2,985	200
T—Sedanette	3,750	4,150	400

The Kentucky Wagon Manufacturing Company, Louisville, Ky., announces various reductions on the Dixie Flyer, as follows:

Model	New Prices	Old Prices	Reduction
Touring	$1,695	$1,895	$150
Roadster	1,445	1,595	150
Speedster	1,795	1,975	200
Sport Touring	1,745	2,150	405
Coupe	2,295	2,570	275
Sedan	2,345	2,570	225

L. J. Ollier on the European Situation

(*Continued from Page 6*)

speculators in France there has been little or no demand, largely because they are being offered prices in excess of 20,000 francs.

Belgium, perhaps, offers a very much better market than France due to the more favorable value of the Belgium franc and the lower duty charges; but I was informed by dealers in Belgium that the maximum price which a buyer is willing to pay for a motor car of any character is about 30,000 francs, and that for cars selling at higher prices there is very little demand.

The Minerva factory, which is the leading automobile manufacturing plant in Belgium, is producing only a limited number of cars and their market is not local; but I was informed that the larger percentage of the cars which they are making are being shipped into other countries. The total number of cars manufactured in all of Belgium would not exceed 2,500 per annum, and a large portion of these are exported. With an improvement of the general economic situation in that country there should be a good business developed because of the splendid roads throughout the country and because of less prejudice against American cars. In fact, the people of Belgium are more favorable to American cars than to the product of any other country because (and rightfully so) the American cars have given a greater degree of satisfaction and service.

In the other European countries the general economic conditions will largely determine the future of automobile sales. Unfortunately, many cars of questionable reputation and character have been shipped into all of the European countries through export houses, whose sole interest seems to have been only to sell some cars regardless of the results obtained, with the natural result that there are at the present time a large number of cars remaining unsold throughout Europe. Standard makes of cars have found comparatively ready markets and there are only a limited number remaining unsold. With a revival of business in Europe the American cars will undoubtedly continue to maintain their position of advantage over all other countries. But the European buyers have learned that all American cars are not good, and will be more discriminating than was the case immediately following the signing of the Armistice.

The information which you received that the British manufacturers were not keen to develop the markets of Belgium and France is not correct, because definite information was given to me to the effect that certain British manufacturers are seeking those markets, even to the extent of being willing to consign cars in order to secure an opening wedge in those countries. You may depend upon it that British manufacturers are constantly alert in seeking the trade of other markets.

Referring to the last paragraph of your let-

The Society Salesman

(*Continued from Page 8*)

salesman than you are. He seems to have sold you on the idea that he didn't need a tractor.

"The next time you meet that kind of fellow, just try this line of talk on him:

"'Of course, you don't need a tractor—that is, *you don't think you need one!* But you're a business man and you're willing to be shown and I'm here to show you—here to show to you why power farming has come to stay. Here to show you how a farm tractor can be profitably used—not up in Canada nor down in the Mississippi Delta—but right here on your own farm!

"'And incidentally—quite incidentally—I'm here to prove that my particular tractor is the one you need.'

"—and then let him have it. Let him have facts—let him have 'em straight from the shoulder—*the truth is good enough.*

"You don't need to resort to pedigree entanglements or secret alliances when you are out to sell an honest-to-goodness tractor—a tractor that's guaranteed to pull three bottoms through virgin soil!"

ter. It is quite true that American manufacturers will find it necessary to carry on their business on a different basis than has prevailed, and it will no doubt become necessary for them to offer equally attractive terms as are being offered by the manufacturers of Europe in seeking their export business. These plans will undoubtedly be worked out satisfactorily in the near future through the channels of the Foreign Trade Financing Corporation and other similar banks working under the provisions of the Edge law.

It is true that certain American manufacturers have made gross misrepresentations to foreign dealers in using cheaper equipment than is usually placed on American cars, and in their indifference to the details. In reality, the foreign buyer is more critical in every respect than the buyers in America.

No manufacturer can hope to build up a permanent foreign business without giving his customers in the foreign countries the very best that his factories can produce, and standing back of the product to an even greater degree than is customary with many manufacturers in America.

Closer study will have to be given by the manufacturer to his foreign business and a more definite knowledge of the requirements of every country obtained. It is of the utmost importance that every American manufacturer should do this, as the impressions formed of American products as a whole are largely the result of many indifferent cases and where good business ethics were seriously lacking.

L. J. OLLIER.

SLOAN AND RASKOB IN EUROPE

Alfred P. Sloan, Jr., vice-president in charge of operations of the General Motors Corporation, and John J. Raskob, chairman of the corporation's finance committee, sailed last week for England and the continent of Europe, where for the next month they will investigate trade conditions for the General Motors Export Corporation.

NASH DEALERS' CONFERENCE

Although prices were discussed at a conference of district sales managers of the Nash Motors Company, Kenosha, Wis., recently, no reduction was authorized because of a promise made to Nash owners that no price reductions would be made before July 1, if at all.

COREY ON MACK BOARD

The International Motor Truck Company, New York, manufacturer of Mack trucks, announces the election of William E. Corey, chairman of the board of the Midvale Steel & Ordnance Company, as a director and member of the executive committee, succeeding Ambrose Monell, president of the International.

HANDLING GMC APPROPRIATIONS

Will Johnson has been appointed vice-chairman of the appropriations committee of the General Motors Corporation, with headquarters in New York. Mr. Johnson's duties will be to handle all matters pertaining to requests for appropriations for capital expenditures for various divisions and subdivisions of the Corporation.

Constructing Equipment

TOOLS AND SUPPLIES AT REASONABLE PRICES—
SUBJECT TO PRIOR SALE—STANDARD MAKES
AND IN FIRST CLASS CONDITION.

We are winding up our work in this territory and will sell at a sacrifice the following

Air Compressors—Ingersoll-Rand, 6x6.

Boilers—40-70 h. p.

Cars—Standard gauge flat; Kalamazoo Push; 24-in. Kopel double truck flat.

Conveyors—Wonda belt sand and gravel; Alvey-Ferguson roller gravity.

Cranes—Brown hoist 15-ton, extra buckets; booms; outrigging.

Hoists—37 h. p. Flory; 38 and 37 h. p. Lidgewood; Clyde No. 106 steam.

Lumber—No. 2 yellow pine 4x4, 4x6, 2x6.

Mixers, Concrete — ½ yd. Smith tilting; No. 7 Jaeger.

Mixer, Mortar—3 Buckeye gee-driven.

Pumps—3-in. Suction, gas-driven diaphragm; Knickerbocker 4-in. suction, gas driven, on trucks; No. 1-6 Gilbert & Barker, gas-driven; Novo; 10 h. p. 4-in. centrifugal on truck.

Office Equipment — Flat-top desks; typewriter desks; card files; Burroughs adding machines, hand and motor-driven; comptometers; typewriters; L. C. Smith and Underwood; check-writers, etc. Stromberg time clocks and equipment.

Steel Reinforcing—½ in. to 1½ in. square and round.

Towers—Insley 160-ft. heavy steel, booms; hoppers; chutes; frames; gates; ladders.

Tractors—1-30-70 h. p. 10-ton Holt caterpillar.

Trailers—Troy No. 3 reversible extension type; troy 2½-yd. bottom dump.

Trucks—G. M. C. 2 and 5-ton dump; 1½ and 2-ton stake.

Woodworking Equipment — Saws, tables, etc.

Miscellaneous — Small tools and extra stock, nails, etc.

Bridge Financing Assured

(*Continued from Page 5*)

increase in traffic up to 5,000,000 cars a year.

Thirty prominent business men in the United States and Canada supplied a fund of $100,000 for the preliminary work. Two companies were formed, the American Transit Company, New York city, which obtained from Congress the authority to span the river, and the Canadian Transit Company, chartered by the Canadian Parliament. These two companies were organized to finance and build the bridge. Mr. Fowler's statement on this point is as follows:

"The contract already has been signed between the American Transit Company, which has authority from Congress to span the river, and the Canadian Transit Company, chartered by Parliament, for joint action in financing and building the bridge. The joint board of directors consisting of eleven members will be elected in August, at which time the proposition of the R. T. Scott Company, Toronto, will be accepted for the sale of bonds for the full amount required for the bridge construction. This proposition provides for a structure built and financed solely for the public benefit without any profits accruing to the promoters other than a reasonable compensation to the directors for their four or five years' tenure of office."

A board of consulting engineers, of which Mr. Fowler is chairman, has been organized. George H. Pegram, chief engineer of the Interborough Rapid Transit Company, New York; Prof. William H. Burr, New York, who was a member of the board of engineers on the Panama Canal and the East river bridges; Prof. C. R. Young, University of Toronto, and Col. C. N. Monsarrat, formerly a member of the board of engineers of the Quebec bridge, are members of this board.

Although the original estimated cost of the bridge was $28,000,000, this figure since has been changed to $30,000,000, which amount is to be obtained by the sale of bonds in denominations from $300 up. The financing plan, which will be handled by the R. T. Scott Company, will not be divulged until the joint board of directors is elected in August.

GREATER MICHIGAN ASSOCIATION

The complete official personnel of the Greater Michigan Association, the supervisory organization for the Western Michigan Development Bureau and the Michigan Tourist & Resort Association, has been completed. The officers are: Chairman, Woodbridge N. Ferris, Big Rapids; vice-chairmen, H. D. Day, Glen Haven, and Fred N. Rowe, Grand Rapids; secretary, W. P. Hartman, Grand Rapids; treasurer, Hugh J. Gray, Grand Rapids. Executive committee: John I. Gibson, Battle Creek; J. H. Klock, Benton Harbor; Perry F. Powers, Cadillac; E. B. Ward, Manistee; A. E. Badger, Detroit; J. F. Hofstetter, Frankfort; J. A. Gerber, Fremont; Carroll F. Sweet, Lee M. Hutchins, W. M. Wardrop and Arthur W. Stace, Grand Rapids; O. H. Gould, Harbor Springs; F. O. Widmark, Ludington; J. C. Beukema, Manistee; J. A. Doelle, Marquette; Archie McCrea, Muskegon; William M. Connelly, Spring Lake; T. M. Sawyer, South Haven; John R. Santo, Traverse City, and Park Robbins, Chicago.

CANNING FACTORY FOR IONIA

The Michigan Canned Food Company, with headquarters in Detroit, has arranged to erect a factory in Ionia. The concern has plants in Owosso and Yale and one under construction in Greenville, and will have three others years in addition to the one in Ionia. The latter, according to the Ionia Sentinel, will have a capacity of 300,000 cases of corn and peas and will take the products from some 4,000 acres about Ionia. The factory will employ about 70 men, it is said, and will afford an outlet for the farming community which will return to them, it is estimated, from $100,000 to $150,000 annually.

CARLBERT CO. IN OPERATION

The Carlbert Company, a new concern in Berrien Springs, is starting operations, the machinery having been installed. The company makes washing machines, home hair clippers, a patented phonograph attachment and patent caps for salt and pepper shakes.

TALBOT MILL SHIPPING ABROAD

The James R. Andrews sawmill, at Talbot, Menominee county, recently shipped to Hong Kong, China, a car of extra high grade elm and maple lumber. Several shipments also have been made to Belfast, Ireland. Although the mill is not one of the largest in the state, it is said to be one of the best equipped.

CHEMICAL PLANT BURNS AGAIN

The machine shop and several other buildings of the Delta Chemical Company, at Wells, were destroyed by fire last week. The buildings, which were razed by a blaze last March, were being rebuilt. Origin of the latest fire has not been determined.

SILAS H. L. COOPER DIES

It is reported from Chicago that Silas H. L. Cooper, chief national bank examiner for the Seventh Federal Reserve district, is dead. Mr. Cooper was for several years attached to the Cleveland Federal Reserve district and had been a national bank examiner about fifteen

The Machine Tool Outlook

(*Continued from Page 8*)

service. The new store we have established in Second boulevard is a part of what we consedee the proper facilities for sales development. This concern has between 4,000 and 5,000 turret lathes in Michigan. While our business in the state, like that of other concerns selling one product or another to the automotive industry, was very large during the war and post-war periods, we do not consider for a moment that the field is exhausted.

"We have opened this store at a time when you could see all the business in sight through the eye of a needle, but we are prospecting and this store is part of our equipment. We judge the buyers of such goods as we sell by their past performances. Yesterday they did not want anything and never expected to want anything; tomorrow they will want something right away. Whether it is a machi~ or a repair part or a tool for the machine, the quicker it can be delivered the better. We go on the theory that a machine which cannot be used because a part or a tool is missing is worse than no machine at all.

"One of the big leads in the machine tool business in the future will be tools for machines such as we manufacture—turret lathes It has been customary for plans to make most of their tools. These tools may differ in small details but so far as production is concerned they could be standardized to a certain extent. We believe that the machine tool builder can perform a valuable service by manufacturing these tools so they can be marketed at less cost than the plant tool room can make them. My concern, for instance, has the plant facilities and the skilled men to do this work. All we need to do is find out what it is the users of machine tools need and then meet their

C. S. STILWELL

requirements. Manufacturing in quantity as against manufacturing in piece-meal for use as required will reduce the cost of tools and save a great amount of time.

"Eighty per cent of our business in this territory has been with the automotive industry. Temporarily there is not much prospect of large sales to these concerns. However, as the life of a machine under high production pressure is not more than ten years, the replacement demand will be steady, once the industry is again in production.

"We have another source of future business—the small shop. In the last twenty years there have sprung up in the state many small shops established primarily to make parts and accessories for automobiles. Some of these shops were converted from some form of metal working to exclusively automotive products.

"The decline of car and truck production has left these establishments high and dry. Some of them already have taken up other lines of manufacture and others will do so unless I am greatly mistaken. The brass-working business is gaining momentum in this state, and this is an industry which offers a rich field for machine tool business. In fact I believe Michigan is due to rival the New England states, Chicago and Cincinnati in the metal working business.

"I do not expect much industrial activity this summer, but by fall I believe we will be well out of the woods. In the meantime machinery and tool manufacturers can get their organizations in shape, establish their service policies and be prepared for a sane business development in this state as well as elsewhere. We have put in a stock of tools and repair parts and set up sixteen machines on the floor here, not much for display as for possible emergency calls, and later we will have a staff of engineers prepared to tackle any machine problem that may confront us."

Companies and Dealers Approved by Commission

Following is a list of companies approved and disapproved and dealers licensed by the Michigan Securities Commission at its meeting of June 2, 1921:

COMPANIES APPROVED

American Power & Light Co., Augusta, Me., $2,500,000 20-year 6 per-cent secured gold bonds, Dated May 1, 1921.

Angle Steel Stool Co., Otsego, Mich., $35,000 common stock.

Consolidated Water & Paper Co., Wisconsin Rapids, Wis., $3,000,000 first mortgage 7½ per-cent sinking fund bonds, dated May 2, 1921.

Consumers Dairy Co., Jackson, Mich., $10,000 common stock.

Continental Land Contract Co., Redford, Mich., $50,000 common stock and $50,000 preferred stock.

Dripping Springs Mines Corp., Phoenix, Ariz., 250,000 shares common stock at $1.00 per share.

Georgea Creek Coal Corp., Charleston, W. Va., $200,000 preferred stock.

Handley-Knight Co., Kalamazoo, Mich., $200,000 first mortgage 7-per-cent convertible bonds dated April 1, 1921.

Marland Oil Co., Ponca City, Okla., $4,000,000 10-year 8-per-cent sinking fund participating bonds, dated April 1, 1921.

Monroe Avenue Realty Co., Jackson, Mich., $128,000 first mortgage 7-per-cent bonds, dated May 16, 1921.

DURANT SELECTS N. Y. DISTRIBUTOR

William C. Poertner has been appointed New York distributor of the car to be manufactured by Durant Motors.

REPORTS EXAGGERATED

Some time ago there appeared in the newspapers a number of press reports which made it appear that a very large number of American automobiles, both passenger cars and trucks, were being held in the customs house at Buenos Aires, Argentina, South America. El Automovil Americano, New York, has received information which tends to show that the reports were exaggerated.

Extracts from two letters from prominent persons to the Class Journal Company's publications are as follows: From M. T. Meadows, manager of the Argentine Chamber of Commerce: "I am pleased to advise that the large stocks of cars reported to you in my letter of March 2 are gradually being liquidated and are now figured at two months normal supply. Owing to general business depression, it is probable that the present supply will carry us through the winter and very few new cars will be needed until the spring and summer selling season in the coming month of September."

This letter was dated May 3, says the trade paper, and as Argentina's seasons are the reverse of ours it was written at the start of the winter season.

The other letter, from W. T. Clark, of Henry W. Peabody & Company, Buenos Aires, said in part: "You no doubt have seen press cablegrams concerning the number of cars and trucks in the Buenos Aires customs house. Most of which reports, I think, were exaggerated. The Association of Automobile Importers sent some of their employes to take count of all cars and trucks deposited there, and they gave a total of 2,003. This count was taken March 25. This is not a large stock for normal times, but under present conditions—with winter coming on—it is excessive."

DOING BUSINESS IN MICHIGAN

MINNESOTA

The foreign corporation laws of Minnesota (Sections 6206, 6207, G. S. 1913) provide that every foreign corporation doing business in that state shall appoint an agent and maintain an office or place of business in the state, file with the Secretary of State a copy of its charter and a statement of its business and pay a fee into the state treasury. Section 6208 provides that: "No corporation which shall fail to comply with the foregoing provisions shall maintain any suit or action * * * in any of the courts of this state."

The supreme court of Minnesota holds that the statute was not intended to apply to corporations engaged in interstate commerce but only to foreign corporations doing local business in the state. The failure of a foreign corporation to comply with the law as to local business does not render its previous interstate transactions either void or unenforceable in the state courts. Where a foreign corporation disposed of its goods through the medium of distributors or jobbers and retail dealers under contracts limiting the territory in which and the persons to whom they could sell and the prices they should charge; publicly advertised its wares for the purpose of attracting consumers to buy of its dealers and employed traveling salesmen who took orders for goods which were filled from New Jersey or were turned over to distributors in Minnesota and were filled by them, it was not doing an intrastate business, the transactions between the corporation and its distributors being out-and-out sales without condition. The court goes on to say that some of the restrictions imposed by the corporation upon its distributors and dealers, particularly those which limited the price at which they might sell, may have been void but this did not change the relation of the parties. Some of the provisions of these contracts may have been consistent with a contract of agency but taking all of the transactions together the court decides that the relation of the parties was clearly that of vendor and vendee and not of principal and agent. (Victor Talking Machine Co. v. Lucker 128 Minn. 171; 150 N. W. 790.) Corp. Journal No. 46.

* * *

Carrying on an advertising and selling campaign under the direction of an agent, who has a place of business in the state where is kept a large supply of advertising matter and a stock of goods from which deliveries are made to customers in Minnesota, is doing business in the state, and the agent in charge is a proper person upon whom to make service. Jenks v. Royal Baking Powder Co., 131 Minn. 335; 155 N. W. 102. Corp. Journal No. 57.

* * *

A corporation selling shoes in the state through stores known and advertised as "Selz Royal Blue" stores and which agree to handle its products exclusively, is "doing business," so as to render service upon its state representative valid against it. Prices v. Selz, Schaub & Co., 174 Minn. 245; 158 N. W. 975. Corp. Journal No. 63.

* * *

A foreign corporation which sends an agent into the state to purchase pulpwood to be delivered in Minnesota, and who received a contract for this purpose and forwarded it to the home office for signature, is doing business in the state so that service of process upon such agent was a valid service upon the corporation. Duluth Log Co. v. Pulpwood Co., 137 Minn. 312; 163 N. W. 520. Corp. Journal No. 71.

ILLINOIS

The state supreme court has held in the case of the Alpena Portland Cement Company vs. the Jenkins & Reynolds Company (decided February 16, 1910, 244 Ill. 354; 91 N. E. 480) that a single transaction within the state by a foreign corporation does not constitute doing business within the meaning of the foreign corporation act, and that "doing business" or "transacting business" by a foreign corporation does not include acts not constituting any part of its ordinary business, such as instituting and prosecuting actions in court, 152 Ill. App. 235. Corp. Journal No. 17.

* * *

A foreign corporation in holding all or the controlling interest in the stock of an Illinois corporation is held to be doing business in Illinois. Central Life Assurance Co. v. Smith, 236 Fed. 170. Corp. Journal No. 64.

* * *

The giving of notes by a foreign corporation is not transacting business in the state. It was not the intention of the statute that a foreign corporation could not incur indebtedness in the state for the purchase of supplies or property or otherwise, or give notes or obligations for its indebtedness, without complying with the conditions for procuring a license to transact business. Plew v. Board, 274 Ill. 232; 113 N. E. 603. Corp. Journal No. 65.

* * *

Agents for foreign corporations engaged in interstate commerce are not subject to local ordinances imposing license taxes on vendors. In the case of Lee's Summit et al. v. Jewel Tea Co., 217 Fed. 965, the following transactions were held to constitute interstate commerce: The Jewel Tea Company is an Illinois merchandising corporation with headquarters at Chicago, in that state. It employed an agent residing in Missouri. The agent canvassed from house to house in Lee's Summit for orders for tea, coffee, spices and coffees. The orders taken were mostly for half-pound and pound lots. He forwarded the orders to the company at Chicago, giving the quantities only, and not the prices of the teas or coffees. At Chicago the company put up the goods in small packages according to the quantities ordered, so as to permit of exact delivery to each purchaser without breaking. On each package was marked its price, but not the name of the purchaser. The packages were then put into a large box or other receptacle and shipped by freight to Lee's Summit, the company being both consignor and consignee. When the shipment arrived at Lee's Summit, the agent received it, opened the box or container, had it hauled around on a dray, delivered the packages unopened to those who had given the orders and collected payment for them on delivery. At the same time he solicited further orders. He made the rounds about twice each month and by other canvassing endeavored to increase the trade. The agent remitted the moneys collected to the company at Chicago. He had no financial interest in the business save his salary, which was paid from that city. Occasionally a purchaser refused to pay or accept and pay. In such case the package intended for him was sent to a branch house of the company at Kansas City, Mo., but all the goods delivered in Lee's Summit were shipped directly there from Chicago in the way described. Corp. Journal, No. 46.

* * *

The mere solicitation of business by agents of a foreign corporation in the state does not constitute "doing business" in such a sense as to subject the corporation to the jurisdiction of the courts of Illinois. Pembleton v. Illinois Commercial Men's Ass'n, 289 Ill. 99; 124 N. E. 355. Corp. Journal, No. 94.

* * *

INDIANA

The act of purchasing real estate to be used by a foreign corporation is not an isolated transaction but constitutes the "doing" or "transacting" of business in the state. Failure to qualify under the foreign corporation prior to entering such a contract renders it unenforcable against the seller. Lowenmeyer v. National Lumber Co., 125 N. E. 67. Corp. Journal, No. 94.

New Publications

"CORRECT LUBRICATION"

The Vacuum Oil Company, New York, has issued a valuable booklet entitled "Correct Lubrication." It is not an advertisement but a textbook on lubrication for automobiles, treating of the importance of oil, troubles that arise from improper lubrication, the difference between winter and summer requirements, costs, motor troubles due in part or entirely to oils, and other information. The booklet is illustrated and is of such size as to be carried in the pocket or kept in the car.

This company manufactures oils and greases under the name of "Mobiloil."

DETROIT TRAILER CO. CATALOG

The Detroit Trailer Company, Detroit, has issued a handsome catalog illustrating and describing its line of motor truck trailers. This is one of the most comprehensive booklets recently brought out. Besides giving all of the essential information prospective buyers may desire, the catalogue has a number of interesting views of trucks with trailer attachment showing the nature of the goods carried and giving a fair idea of the usefulness and help for industrial or business concerns in the employment of trailers. The company now makes the following standard designs: Four-wheel models B and D, reversible and non-reversible; four-wheel drop frame, for load-testing hand-model C trailers, for light work; pole trailers, 1½ to 15-ton; semi-trailers, 3 to 15-ton.

Any one interested will receive a catalogue by writing to the company's headquarters, 954 Milwaukee avenue east.

"FACTORS OF SAFETY"

"Factors of Safety," a neat booklet on automobile spring manufacture, has been issued by the Detroit Steel Products Company, Detroit. The book is bound in brown paper, is illustrated, and the contents tell the story of spring manufacture from raw material to the finished product, including engraving, testing, heat treating, shearing, forming, tempering and assembly.

"THE GOSPEL OF GRIT"

"It is a surprising fact that the total volume of business never drops more than 20 per cent even in the worst of hard times," says an excerpt from an advertisement by Evans-Winter-Hebb, Detroit, reprinted in a booklet just issued by the same concern under the name of "The Gospel of Grit." This is a compilation of advertisements recently published, all of which were bits of business philosophy for just such a period as business has been going through. The opening quotation carries the thought that, although one kind of business may be in the "dumps," there is always some other business "going strong," and when a balance is struck conditions are not as black as pessimism paints them.

HOIST CO. IN NEW QUARTERS

The Hydraulic Hoist Manufacturing Company, Detroit, has moved from 954 Milwaukee avenue east to 5730 Michigan avenue, in order to obtain more working space.

July Furniture Slash Urged on Manufacturers

For the July sale, furniture prices will be cut so close to hardpan that further recessions cannot be made. This is the policy that the national council of furniture associations will recommend to the manufacturers.

The national council met in Chicago last week and was attended by representatives of the case goods, chairs, centertables, dining tables, dining room furniture, upholstered goods and kitchen cabinet branches of the furniture industry. George G. Whitworth represented the case goods manufacturers and the Grand Rapids market. The reports indicated the industry as a whole was on a production basis of about 60 to 65 per cent of normal and some of the manufacturers seemed to think the prospective lower price was a factor in the dullness of trade.

To eliminate this factor and to stabilize business generally the council adopted resolutions recommending to manufacturers that they thoroughly revise their prices for the July sale, that the prices be made the very lowest possible, taking into consideration actual costs at normal production and allowing some margin for safety.

GREENFIELD ENLARGES BUSINESS

A further expansion of the Greenfield Tap and Die Corporation, Greenfield, Mass., has taken place. The board of directors has voted in favor of the purchase by the corporation of the entire capital stock of the Greenfield Machine Company, Greenfield, manufacturer of cylindrical and universal grinders, and the Morgan Grinder Company, Worcester, Mass., manufacturer of internal grinders.

The combination of the two above mentioned concerns, together with the machines now produced by the Greenfield corporation, will constitute the Machine Division of the Greenfield Tap and Die Corporation, which will operate both plants in their present location, although eventually the Worcester plant will be moved to Greenfield.

The organization of both plants will remain the same and is as follows: Morgan Grinder Company—President, Ralph L. Morgan; treasurer, L. M. Crittsinger; general manager, Charles E. Hildreth. Greenfield Machine Company—President, E. F. Smith; treasurer, Joseph G. Stevens.

BOND MEN PICNIC AT PONTCHARTRAIN

Fifty-seven members and three guests of the Bond Men's Club of Detroit attended the annual outing at Ponchartrain-on-the-Lake, near Mount Clemens, Friday, September 17. The party boarded the private D. U. R. car "Yolandie" at 10:30 a. m. and arrived at the resort in time for picnic lunch. After which there was a ball game and other games requiring less muscle and more strategy. At 1 o'clock the party sat down to a splendid frog and chicken dinner in the hotel dining room. G. J. McCoy, of the Security Trust Company, responded to President Higbie's address of welcome and showered his good humor and witticisms plentifully upon the diners. Officers for the ensuing year were elected as follows: President, Alfred Rice, of the First National Company; vice-president, Charles B. Hull, of Hull, Bumpus & Company; secretary, E. K. Matlock, of Detroit Trust Company, and treasurer, J. W. Ballmann, of Bolger, Mosser & Willaman. The above, with Duncan McNab, Carrol H. Lawson and Edwin K. Hoover, comprise the board of governors for the coming year. The club membership limit was raised to 200. Present membership is 136.

Foreign Commerce School This Year June 20-July 30

The second school of Pan-American and Foreign Commerce is being held in Washington, D. C., at the Pan-American Union, June 20 to July 30, and both men and women will be admitted, although the number will be limited.

It was last year that the first school was organized in the Pan-American Union and forty-eight students received certificates of graduation for the successful completion of the courses of study.

The courses being given this year include the following: Commercial Spanish, commercial Portugese, document technique, salesmanship, and a general course in Pan-American commerce, including commercial geography, transportation, shipping and finance. Experts who have seen practical service in commercial education as trade commissioners and as practical business representatives, together with experts in Portuguese and Spanish, give the regular courses of study throughout the session, and a lecture faculty of many leaders in foreign trade corporations, commercial organizations related to foreign trade, governmental departments and attaches of embassies and legations delivers addresses.

The United States Department of Commerce, through the secretary and the Bureau of Foreign and Domestic Commerce, and other governmental agencies will co-operate actively in making a success of the school. The Library of the Department of Commerce is available for research work.

The officials in charge of the school are: Chairman, advisory council, Dr. L. S. Rowe, director general, Pan-American Union; dean of the faculty, Dr. R. S. MacElwee, Georgetown University; executive director, Dr. Clarence J. Owens, director general of the Southern Commercial Congress.

THE DEMOCRATS AND THE FEDERAL RESERVE ACT

To the Editor:

I read with very considerable interest your article on what changes, if any, should be made in the Federal Reserve system. I am writing merely to correct some foolish errors that your bank president friend has drifted into.

I, with a great many others, feel that the Federal Reserve Bank is the greatest piece of constructive legislation that we have had in at least a quarter of a century, if not in the last half century, but when your dear friend the banker through apparently the most abject ignorance says that the Democrats in this case did not know what they were doing, he needs to be enlightened. All students of the financial problem know that the idea of a central bank dates back for a number of years; in fact, it has come up at different times all the way from Nicholas Biddle and Andrew Jackson down to when the Federal Reserve Act was finally passed. I think that Andrew Jackson made a fight against it and the reasons he gave for this were that too much power would be placed in the hands of a private central bank which would be governed by selfish interests and not from any public point of view, the controllers of the bank naturally looking to filling their own coffers rather than serving the public. That too, was the point on which the Aldrich plan was obtained a number of years back and that is the reason why the present scheme went through, the originators of the plan feeling that the Government would have enough hold on the machinery and operation of the bank to protect the public interests. When our dear banker friend says that he did not believe the Democrats knew what they were doing when they passed it, I would refer him to the Honorable Robert L. Owen, of Oklahoma, a gentleman of brilliant learning and fine culture who has given this broad subject more intense thought than almost any person I know of in the United States. I would like to refer him to ex-Senator Shafroth, of Colorado, who gave the most extensive study to this plan. These men and a few other thoroughly intelligent Democrats, were the authors, framers and builders of the Federal Reserve Banking System and it looks small and out of place for any man, no matter what his position may be, to deprive these patriotic fellow citizens of whatever credit is coming to them for patriotic and honest work.

FRANK B. NILES.

Toledo, Ohio.
June 14, 1921.

The article referred to in the foregoing letter appeared in the Bankers and Investors annuit of the Michigan Manufacturer and Financial Record, published June 4.—The Editor.

MICHIGAN EMPLOYMENT CONDITIONS

James H. Shepherd, Lansing, district manager of the Michigan Mutual Liability Company, reports that, according to the applications for casualty insurance, industrial conditions in Michigan have improved. Manufacturing concerns throughout the state, he says, are applying for increased insurance, which indicates a return to production and full employment. Increases in insurance have been shown each month this year.

The Michigan Free Employment Bureau reports that lessened industrial activity was shown during May by the fact that employers asked for less workers, fewer applied for positions and less places were filled. In May employers asked for 2,559 men and 1,173 women, while 7,093 men and 1,452 women applied for work. Two thousand two hundred and thirty-one men referred to positions, as were 966 women. In detroit there were 1,624 applications for work with 814 filled; in Saginaw 1,204 applications, 55 filled; Kalamazoo, 1,095 applications, 261 filled; Jackson 985 and 352; Flint 954 and 165; Lansing 254 and 115; Battle Creek 475 and 80.

DINNER TO WILSON

Seventy-five business men of Pontiac were among those who attended a complimentary dinner to Charles B. Wilson, vice-president of Willys-Overland, Inc., in Toledo, last week. Mr. Wilson formerly was president of the Wilson Foundry & Machine Company, Pontiac. The Michigan delegation presented Mr. Wilson with a bronze tablet on which was inscribed: "The Inspiration and influence of Charles B. Wilson are so indelibly impressed on Pontiac that they will endure until the end of time."

Mr. Automotive Parts Manufacturer:--

Did You Get That Order You Figured On?

Maybe this is your predicament.

The other day a local parts manufacturer called on the Purchasing Agent of ——— Motor Company.
He wanted to quote on wrist pins, oil pump plungers, cam rollers and pins, etc.

Says the P. A.: "Have you got a Detroit Centerless Grinder?"

"No. Why?" said the Parts Manager.

Here is what the Purchasing Agent said:
"You can't compete with others unless you grind by the Centerless Method, and you better buy one of the machines."

AND WHY NOT?

Piston Pins, 1 1-16" dia. x 3½ long—125 per hr.
Piston Pins, ¾" dia. x 2¾ long—200 per hr.

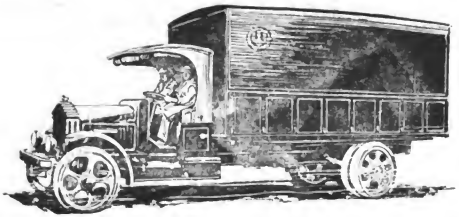
How to Cut Manufacturing Costs On Brass Parts

You realize the necessity for reducing costs—without sacrificing quality.

But do you realize that *MUELLER* can help you so reduce them? The quickest way that we can prove this to you is to ask you to send us drawings, samples or specifications for anything you use in the line of brass parts, stating quantities desired.

Then we will promptly quote you interesting prices. We are equipped to manufacture brass and bronze rod, brass and copper tubing, brass and bronze forgings, sand castings in brass, bronze and aluminum, die castings in aluminum and white metal and all kinds of screw machined products.

The *MUELLER* engineers are competent to solve any manufacturing problem in these lines and are today solving similar problems for many of the largest manufacturers in America.



It will pay you to get better acquainted with *MUELLER*.

Mueller Metals Co., Port Huron, Mich.

Makers of "Red Tip" Brass Rod; Brass and Copper Tubing; Forgings and Castings in Brass, Bronze and Aluminum; Die Castings in White Metal and Aluminum; also Screw Machined Products.

H. Mueller Manufacturing Co., Decatur, Ill., and Sarnia, Ont. Makers of Water, Plumbing and Gas Brass Goods and Tools.

What is a high price?

A truck that outlasts other trucks and costs less to operate is not high priced. Cost must always be figured against the work done and the time that is saved. The first cost of a Pierce-Arrow is no more than any good truck costs.

Pierce-Arrows not only do more work at a lower operating expense, but they keep out of the repair shop and keep working. And they last longer. It is the cheapest truck to buy.
